Appendix E: Report on the CEP Survey of Federal Offices

Beginning in January 2017, the Commission on Evidence-Based Policymaking (CEP) extended invitations to over 200 Federal offices to complete a survey entitled, "Building Evidence from Data: Capacity and Needs in the Federal Government." This report describes the purpose and development of the survey, methods used in data collection, and observed response patterns. It then presents highlighted findings based on a limited analysis of selected survey items.

Purpose and Development of the CEP Survey of Federal Offices

The CEP Survey of Federal Offices provided an opportunity for eligible offices to share information with the Commission about how they collect, use, and make data available for evidence-building. The survey also collected detailed information about the barriers Federal offices face in accessing data for evidence building. The survey was designed to be applicable to individual Federal offices involved in evidence building and use; therefore multiple relevant offices within each Federal department received an invitation to complete the survey. The Commission sought detailed information directly from individual offices so it could learn about variations in capacity and the prevalence of key barriers within Federal departments and government wide.

List of Eligible Offices

The Commission developed the initial list of offices eligible to participate in the CEP Survey of Federal Offices in early November 2016. Eligible offices were defined as those Federal units generating data, building evidence, and using evidence for policymaking. The initial list was developed from Federal budget accounts for Chief Financial Officers (CFO) Act Agencies at the bureau level.

Additional offices were added, including at the sub-bureau level,[1] to ensure coverage of known Federal offices involved in evidence building and use. The added offices included units identified in *Statistical Programs of the United States Government: Fiscal Year 2016*[2] and offices that are members of the Interagency Council on Evaluation Policy. The list excluded offices that primarily provide operational support or administrative functions, such as Offices of the General Counsel and procurement offices.

During data collection, discussions with individual offices and department officials led to several list adjustments. Some Federal offices were added to the list to ensure complete coverage. For example, the Office of Advocacy in the U.S. Small Business Administration was added and the National Center for Special Education Research in the U.S. Department of Education was made an eligible office separate from the National Center for Education Research. The National Institutes of Health elected to submit a single coordinated response for its Institutes and Centers; the list was adjusted accordingly.

The final list of eligible offices consisted of 209 offices from 20 agencies with at least two operating units, plus an additional 11 single bureau agencies and commissions (e.g., Corporation for National and Community Service, Institute of Museum and Library Services). See Attachment A for the final list of eligible and responding offices.

Each office on the list was coded by type of office (Principal Statistical Agency, Evaluation Office, or Other) and by priority for nonresponse follow-up (High, Medium, or Low). Type of office designation was derived from a variety of sources. Principal Statistical Agencies were identified from

---

1. Budget account data obtained from the FY 2017 President's Budget provided by the Office of Management and Budget.

2. Office of Management and Budget, Statistical Programs of the United States Government (Washington: D.C.: 2017); *https:// obamawhitehouse.archives.gov/sites/default/files/omb/assets/ information_and_regulatory_affairs/statistical-programs-2017.pdf* (accessed August 8, 2017).

Statistical Programs of the United States Government: Fiscal Year 2016. Evaluation Offices were identified through the Interagency Council on Evaluation Policy and through Commission expertise. "Other Offices" comprised the remainder and included a variety of statistical programs, program agencies, and policy offices.

The nonresponse priority designation was based on OMB's annual report of statistical activities and Commissioner and CEP staff expertise.[3] Offices designated as high priority for nonresponse follow-up included statistical and evaluation offices plus other offices that are either large or play a significant role in Federal evidence building. Offices designated as low priority for nonresponse follow-up included small offices and offices with a limited role in Federal evidence building. Medium offices comprised the remainder. The priority designation was used during data collection to determine the intensity of nonresponse follow-up efforts.

Questionnaire Development and Testing

CEP staff developed the survey content based on Commissioner input about key concepts they wished to measure. The draft survey was programmed into the MAX Survey platform managed by the Office of Management and Budget (OMB) during November and December of 2016. Commissioners reviewed the survey in early December of 2016 and OMB officials offered suggestions which were incorporated into a testing version. In late December of 2016, staff sent the testing version of the survey to nine Federal colleagues with relevant expertise and availability during the testing timeframe. All of the survey testers were from offices eligible for the survey but none of the testers was their office's designated respondent for the actual survey data collection.

Survey testers provided substantial comments on the survey's content, flow, and item wording.

CEP staff debriefed by telephone with most of the testers after they had filled out the survey and provided written comments. One tester agreed to fill out the survey and concurrently "think aloud" while CEP staff listened, took notes, and asked questions about item clarity and construction. All of this input helped to ensure that the intention and wording of the survey items would be clear to respondents. Final revisions based on testing were made in early January 2017.

See Attachment B for a summary of survey items and Attachment C for detailed survey content including skip patterns. The survey closes with a series of open-ended questions about barriers to evidence building and examples of evidence-building activities. Responses to the open-ended questions are shown in Attachment D.

Data Collection Procedures

CEP staff identified a specific senior Federal official—generally a Director, Deputy Director, Chief of Staff, or Chief of Policy—as the primary contact and respondent for each eligible office. Initial invitations to complete the survey were sent to respondents by email from the MAX Survey platform on Monday, January 9, 2017. Reminder emails were sent to all nonrespondents on each of the three following Tuesdays in January. On February 1, 2017, the CEP Executive Director sent a follow-up email to all nonrespondents directly from her CEP email account rather than through the MAX Survey system. The email from her CEP account resulted in a large number of undeliverable email returns that had not previously been detected by the MAX system. The inaccurate email addresses generally fell into two categories: emails for officials who had left Federal service during the Presidential transition in late January 2017 and emails for incumbent Federal officials that contained errors. CEP staff investigated all of the undeliverable emails, found replacements for officials who had left, and corrected email address errors. New invitations were sent to replacement respondents and to corrected email addresses in early February. Beginning on February 7th, CEP staff began intensive email and telephone nonresponse follow-up of eligible offices designated on the final list of eligible offices as "high priority;"

---

3. This determination was also informed by the Office of Management and Budget's (OMB) paper, "Overview of Federal Evidence-Building Efforts," White Paper for the Commission on Evidence-Based Policymaking (Washington, D.C.: OMB, Executive Office of the President, 2016); *https://obamawhitehouse.archives. gov/sites/default/files/omb/mgmt-gpra/overview_of_federal_evidence_building_efforts.pdf* (accessed August 8, 2017).

Table A.—Survey Response Rates by Type of Office and Priority Category

	Number of Eligible Offices	Number Responding	Response Rate
Type of Office			
Principal Statistical Agency	13	13	100%
Evaluation Office	12	10	83%
Other	184	67	36%
Priority Category			
High	57	45	79%
Medium	63	18	29%
Low	89	27	30%
Total	209	90	43%

follow-up efforts continued until the close of data collection. There was no additional follow-up conducted for "medium priority" and "low priority" offices. Data collection remained open with late responses accepted until the end of April 2017.

Response Rates

At the close of data collection, 90 of the 209 eligible offices had submitted survey responses for an overall response rate of 43 percent as shown in Table A. Response rates varied considerably by type of office and priority designation. All 13 of the Principal Statistical Agencies, 83 percent of Evaluation Offices, and 79 percent of the offices designated as "high" priority responded to the survey. In contrast, 36 percent of the Other offices and 29 and 30 percent of "medium" and "low" offices, respectively, submitted responses.

Table B shows the number of eligible and responding offices for each agency. An agency had to have at least two eligible offices to be listed separately in this table. Single office agencies and commissions are aggregated in Table B. Agency-level response rates ranged from 100 percent for the National Science Foundation and the U.S. Small Business Administration to 0 percent for the U.S. Agency for International Development.

Data Analysis

CEP staff downloaded a .csv file from the Max Survey platform containing all of the survey responses for responding offices. The analysis file excluded responses to the open-ended questions at the end of the survey. The .csv file was converted to an Excel file for analysis with pivot tables. CEP staff edited the data in creating the final analysis file, including concatenating the names of responding Federal offices into one variable and recoding "yes" to 1 and "no" to 0 for certain variables used in the limited analysis presented in this Appendix. The final survey analysis file used to create the tables presented in this Appendix is available as an Excel spreadsheet at *www.cep.gov/ library/Final-CEP-Survey-Analysis-File.xlsx*.

The results presented in Tables 1 through 4 represent only a small portion of the potential for analysis from this survey. For example, the survey goes into considerable detail about the various data services that agencies provide (e.g., do you have staff dedicated to conducting disclosure review?) and the specifics of data linkages (e.g., What linkage keys do you use? How do you protect them?). The final survey analysis file may be a resource for those seeking more information about capacity for and barriers to evidence generation and use among Federal agencies.

Table B.—Survey Response Rates by Agency

Agency	Number of Eligible Offices	Number Responding	Response Rate
U.S. Department of Agriculture	19	4	21%
U.S. Department of Commerce	19	5	26%
U.S. Department of Defense	4	2	50%
U.S. Department of Education	13	6	46%
U.S. Department of Energy	10	4	40%
U.S. Department of Health and Human Services	39	24	62%
U.S. Department of Homeland Security	9	1	11%
U. S. Department of Housing and Urban Development	6	1	17%
U.S. Department of Justice	12	5	42%
U.S. Department of Labor	8	4	50%
U.S. Department of State	3	1	33%
U.S. Department of the Interior	10	5	50%
U.S. Department of the Treasury	8	4	50%
U.S. Department of Transportation	11	2	18%
U.S. Department of Veterans Affairs	5	3	60%
U.S. Environmental Protection Agency	8	2	25%
National Science Foundation	3	3	100%
U.S. Small Business Administration	2	2	100%
U.S. Social Security Administration	7	5	71%
U.S. Agency for International Development	2	0	0%
Single Bureaus and Commissions	11	7	64%
Total	209	90	43%

Highlights of Survey Results

Tables 1 and 2 are based on the responses provided by the 79 responding Federal offices that reported that they collect or analyze data to produce statistics about the economy, society, or environment, to evaluate a program to understand its implementation or impact on participants; to support research on a population, group of entities, policy, or program, or to conduct analysis of existing policies or programs to assist decision making or who spend 1 to 100 percent of their total annual budget for these statistics, evaluation, research, or policy analysis (SERA) purposes.

Table 1 summarizes barriers to using data for evidence building, by showing the number of Federal offices that reported that each of nine factors is a "major" or "moderate" barrier to its ability to use data for statistical, evaluation, research, or policy analysis purposes.

• Over half of responding Federal offices reported that "lack of ability to hire appropriate staff", "inadequate funding", and "legal limitations" were major or moderate barriers. Ten out of 13 Principal Statistical Agencies and 8 out 10 Evaluation Offices cited "legal limitations" as a barrier. About three-quarters of offices that spend 91 to 100 percent of their budget for SERA purposes reported that "legal limitations" was a major or moderate barrier.

Table 2 summarizes the most prevalent barriers to accessing specific kinds of data, showing the number of Federal offices reporting that they considered using 13 different kinds of data for statistical, evaluation, research, or policy analysis purposes, but ultimately were not able to use the data because it was too hard to get access to the specific dataset they needed. For each kind of data, the table then shows how many offices reported certain barriers to using those data and whether those barriers occurred in their own office, in their own agency, in another agency, or at the state level. State level is only applicable to certain kinds of data.

- Of the 79 offices that collect or analyze data for SERA purposes or spend a portion of their budget for SERA purposes, 22 found Federal tax data hard to access. Twelve offices found criminal justice data and Medicare/Medicaid claims and utilization data hard to access and 11 found education data (Federal or state), Federal social security data, or state unemployment insurance wage record data hard to access.

- Among the 22 offices that found Federal tax data hard to access, 13 reported that regulations or policies in another agency that make it difficult to link data was a barrier to access and 11 reported that statutes prohibiting data sharing in another agency was a barrier to access. Seven offices indicated that lack of staff, policies, and procedures to establish data sharing agreements in their own offices was a barrier to accessing Federal tax data.

Tables 3 and 4 are based on the 70 responding Federal offices reporting that they collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities) routinely (as a regular part of their programs or processes), or occasionally (not as a regular part of their programs or processes).

Table 3 shows the number and percent of Federal offices that reported that any other agency, or its representatives, access their confidential data for SERA purposes and the number and percent of agencies that reported that researchers outside the Federal government access their confidential data.

- Three-quarters of the Principal Statistical Agencies and 5 out of 8 Evaluation offices report that other agencies access their confidential data for SERA purposes. Offices with higher percentages of their budget allocated for SERA purposes are more likely to report that other agencies access their data.

- All of the Principal Statistical Agencies and 5 out of 8 Evaluation Offices report that outside researchers access their confidential data, while only 22% (13 out of 60) of Other offices report that outside researchers access their confidential data.

Table 4 shows the number and percent of Federal offices that typically create metadata or technical documentation for the data the office produces, including variable definitions, units of measurement, and response ranges; changes to definitions, scope, or data collection processes over time; and imputation procedures or other edits to the data.

- Overall, two-thirds of responding Federal offices that collect data routinely or occasionally report that they produce metadata that includes variable definitions, units of measurement, and response ranges, compared to 61 percent that produce metadata that includes changes to definitions, scope, or data definitions over time and 53 percent that produce metadata that include imputation procedures or other edits to the data.

- A higher proportion of Principal Statistical Agencies and Evaluation Offices than Other offices produced metadata with each of the three elements.

Table 1. Federal offices that report each factor is a "major" or "moderate" barriers to using data for evidence building, by selected office characteristics: 2017

		Factors								
	Number of Federal offices	Lack of ability to hire appropriate staff	Lack of ability to execute and manage contracts	Inadequate funding	Legal limitations	Information Technology (IT) systems or requirments	Privacy and data security requirements	Political processes (e.g. transitions in agency/office leadership, congressional oversight)	Information collection requirements (e.g. PRA and IRB)	Other
Total	**79***	**43**	**13**	**48**	**41**	**35**	**37**	**21**	**36**	**7**

1 to 10 percent	27	14	4	13	7	13	12	4	13	3
11 to 50 percent	11	8	2	9	6	6	3	5	6	1
51 to 90 percent	8	3	1	2	4	3	4	2	2	1
91 to 100 percent	25	14	5	17	19	10	15	7	11	1
No Response	7	4	1	6	5	3	3	3	4	1

*The number of responding Federal offices varies across factors due to item nonresponse. To calculate percentages, use a base of 79 responding offices for each factor except for "lack of ability to execute and hire contracts" and "privacy and data security requirements" (77), "legal limitations" (75), and "political processes" (71).

NOTE: Table based on the 79 responding Federal offices that reported on the survey that they collect or analyze data for statistical, evaluation, research, or policy analysis (SERA) purposes or spend a portion of their budget for SERA purposes."Type of Office" was determined in consultation with OMB when developing the list of eligible offices. "Percent of Budget for SERA Purposes" is the response to an item on the survey.

Attachment B. Condensed Version of Survey Items from the CEP Survey of Federal Offices, 2017

Approximately what percentage of your office's total annual budget is for statistical, evaluation, research, or policy analysis purposes? 0 percent 1 to 10 percent 11 to 50 percent 51 to 90 percent 91 to 100 percent
Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)? Yes, routinely (as a regular part of our programs or processes) Yes, occasionally (not as a regular part of our programs or processes) No
Approximately what percentage of your office's total annual budget is for collecting data from individual units? 0 percent 1 to 10 percent 11 to 50 percent 51 to 90 percent 91 to 100 percent
For which of the following purposes does your office, or its representatives, collect data from individual units? To produce statistics about the economy, society, or environment To evaluate a program to understand its implementation or impact on participants To support research on a population, group of entities, policy, or program To conduct analysis of existing policies or programs to assist decision making To conduct or support program operations To monitor program or grant performance
Are any of the data collected by your office, or its representatives, considered confidential?
Who analyzes your office's confidential data? Staff physically present in my office Staff working in a location other than my office (including teleworking) Contractors physically present in my office Contractors working in a location other than my office Staff or contractors in another office in my agency Staff or contractors in another agency My office's grantees Researchers outside of the Federal government
Analyzing Micro-Level Data From Another Agency Does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?
Which of the following kinds of micro-level data collected by any other office or agency does your office, or its representatives, analyze?

Kinds of Data:
Criminal Justice Data
Decennial Census/American Community Survey (ACS)
Education data (Federal)
Education data (State or Private)
Federal data on business program participation
Federal establishment survey data (e.g., Economic and Agricultural Censuses)
Federal tax data
Federal social security data
Human services data (e.g. SNAP and TANF)
Medicaid/Medicare claims and utilizations data
Military service and veteran benefits records
State unemployment insurance wage record data
Vital records (birth and death) data

For which of the following purposes does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?
To produce statistics about the economy, society, or environment
To evaluate a program to understand its implementation or impact on participants
To support research on a population, group of entities, policy, or program
To conduct analysis of existing policies or programs to assist decision making
To conduct or support program operations
To monitor program or grant performance

Linking Data
Does your office, or its representatives, link the confidential data it collects with data from another agency?

Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units? *[Kinds of Data]*

Which of the following best describes your process for linking to *[each Kind of Data]*?
Our office, or its representatives, does the linkage.
Another office or agency, or its representatives, does the linkage.
A third party, or its representatives, does the linkage.
Other

Does your office have staff or contractors whose primary job duties involve the technical process of data linkage?

How many staff or contractors does your office have whose primary job duties involve the technical process of data linkage?
1 to 2
3 to 5
6 to 10
More than 10

Which of the following statements best describes the regularity of data linkage in your office?
All of our data linkages are for ad hoc projects.
Most of our data linkages are for ad hoc projects; a few are a part of our regular processes.
Our data linkages are about evenly split between ad hoc projects and regular processes.
Most of our data linkages are a part of our regular process; a few are ad hoc projects.
All of our data linkages are part of our regular processes.

How does your office pay for data linkage?
My office has a specific budget allocation that covers data linkage.
My office chooses to set aside a portion of the budget to help pay for data linkage.
Programs within my office that do data linkage absorb the cost in their budgets.
Other offices provide funds for data linkages.
User fees help pay for data linkage.

Which of the following does your office, or its representatives, use for data linkage? A probabilistic match of key characteristics. A linking key (personal identifier). A combination of probabilistic matching and linking keys
Which of the following keys does your office, or its representatives, use for data linkage? Social Security Number (SSN) Masked SSN Employer Identification Number (EIN) Name Address Data of Birth Biometrics (e.g. fingerprints)
How does your office, or its representatives, secure data linking keys? By restricting access to the linkage key or linkage key crosswalk. By generating a pseudo-anonymous key (e.g., hash, unique ID, etc) for linking. By removing the linkage key from the file(s) once linkage is complete.
Does your office, or its representatives, keep micro-level data that are linked for statistical, research, evaluation, or policy analysis purposes so they can be analyzed again at a later time? Yes, routinely (as a regular part of our programs or processes) Yes, occasionally (not as a regular part of our programs or processes) No
Accessing Data Does another agency, or its representatives, ever access your office's confidential data for its own statistical, evaluation, research, or policy analysis purposes?
How does another agency, or its representatives, access your office's confidential data? Staff or contractors come onsite to my office or agency to access the data. Through a Federal Statistical Research Data Center (FSRDC) Through a distributed thin client Citrix or VPN network Through a Memorandum of Understanding (MOU), license, or contract agreement Through a data archive (e.g., Interuniversity Consortium for Political and Social Research)
Approximately how many other agencies, or their representatives, access your office's confidential data each year? 1 to 2 3 to 5 6 to 10 More than 10
Which of the following statements best describes how regularly another agency, or its representatives, access your office's confidential data? Many other agencies routinely (e.g., annually, quarterly, monthly) access my office's confidential data. A few other agencies routinely (e.g., annually, quarterly, monthly) access my office's confidential data. Many other agencies occasionally (i.e. on an ad hoc basis) access my office's confidential data. A few other agencies occasionally (i.e. on an ad hoc basis) access my office's confidential data. Some agencies routinely (e.g., annually, quarterly, monthly) and some agencies occasionally (i.e. on an ad hoc basis) access my office's confidential data.
Do researchers outside of the Federal government ever access your office's confidential data?
Approximately how many outside researchers access your office's confidential data each year? 1 to 10 11 to 50 51 to 100 More than 100
How do researchers outside of the Federal government access your office's confidential data? The researcher comes onsite to my office or agency to access the data Through a Federal Statistical Research Data Center (FSRDC) Through a distributed thin client Citrix or VPN network Through a Memorandum of Understanding (MOU), license, or contract agreement Through a data archive (e.g., Interuniversity Consortium for Political and Social Research)

Does your office receive and review requests from outside researchers for access to confidential data?
How often does your office receive new requests from outside researchers for access to confidential data? Daily Weekly Monthly Yearly Sporadically
Which of the following statements best describes how regularly outside researchers access your office's confidential data? Many outside researchers routinely (e.g. annually, quarterly, monthly) access my office's confidential data. A few outside researchers routinely (e.g. annually, quarterly, monthly) access my office's confidential data. Many outside researchers occasionally (i.e. on an ad hoc basis) access my office's confidential data. A few outside researchers occasionally (i.e. on an ad hoc basis) access my office's confidential data. Some outside researchers routinely (e.g. annually, quarterly, monthly) and some outside researchers occasionally (i.e. on an ad hoc basis) access my office's confidential data.
Does your office have staff or contractors whose primary job duties involve reviewing and processing outside researcher requests for access to confidential data?
How many staff or contractors does your office have whose primary job duties involve reviewing and processing outside researcher requests for access to confidential data? 1 to 2 3 to 5 6 to 10 More than 10
Does your office have a system for tracking requests from outside researchers for access to confidential data?
Does your office have a process for reviewing output produced by outside researchers to prevent disclosure of the identities of individual units?
How often does your office receive new requests for disclosure review of outside researcher analyses? Daily Weekly Monthly Yearly Sporadically
Does your office have a process for documenting the results of disclosure review of outside researcher analyses?
Does your office have staff or contractors whose primary job duties involve disclosure review of outside researcher analyses?
How many staff or contractors does your office have whose primary job duties involve disclosure review of outside researcher analyses? 1 to 2 3 to 5 6 to 10 More than 10
Does your office, or its representatives, typically create metadata or technical documentation for the data it produces that includes the following? Variable definitions, units of measurement, and response ranges Changes to definitions, scope, or data collection processes over time Imputation procedures or other edits to the data
Managing Historical Data Does your office, or its representatives, have a process for archiving, managing, and retrieving your historical micro-level data?
Does your office have staff or contractors whose primary job duties involve archiving, managing, and retrieving your historical micro-level data?

How many staff or contractors does your office have whose primary job duties involve archiving, managing, and retrieving your historical micro-level data? 1 to 2 3 to 5 6 to 10 More than 10
Does your office, or its representatives, continue to manage or clean your historical micro-level data?
How easy or difficult is it for your office, or its representatives, to retrieve and use your historical micro-level data? very easy somewhat easy somewhat difficult very difficult
When does your office, or its representatives, destroy your historical micro-level data? We archive all historical micro-level data. We destroy historical micro-level data when they are no longer being used for the purpose for which they were collected. We destroy historical micro-level data on a schedule established by statute, regulation, or policy. We destroy historical micro-level data when they are no longer relevant for research or policy analysis. We destroy historical micro-level data when they are no longer relevant for research or policy analysis.
Using Data for Statistical, Evaluation, Research, or Policy Analysis Purposes Which of the following kinds of data has your office, or its representatives, considered using for statistical, evaluation, research, or policy analysis purposes but did not because it was too hard to get access to the specific dataset you needed? [Kinds of Data]
Which of the following factors made it hard for your office to get access to [each Kind of Data]? Lack of staff, policies, and procedures to establish data sharing agreements Statutes prohibiting data sharing Regulations or policies that make it difficult to link data Lack of capacity in information technology systems Lack of staff or contractors with specific technical expertise needed to link data Concerns about keeping the data secure and confidential
[For each Kind of Data] Was/were the [factor from the previous question]: In your office? In another office in your agency In another agency At the state or local level [only applied to appropriate Kinds of Data]
To what extent is each of the following a barrier to your office's ability to use data for statistical, evaluation, research, or policy analysis purposes? Lack of ability to hire appropriate staff Lack of ability to execute and manage contracts Inadequate funding Legal limitations Information Technology (IT) systems or requirements Privacy and data security requirements Political processes (e.g., transitions in agency/office leadership, Congressional oversight) Information collection requirements (e.g. Paperwork Reduction Act and Institutional Review Boards)

Which ONE of the following is the most critical barrier to your office's ability to use data for statistical, evaluation, research, or policy analysis purposes? Lack of ability to hire appropriate staff Lack of ability to execute and manage contracts Inadequate funding Legal limitations Information Technology (IT) systems or requirements Privacy and data security requirements Political processes (e.g., transitions in agency/office leadership, Congressional oversight) Information collection requirements (e.g. Paperwork Reduction Act and Institutional Review Boards)
If applicable, please provide additional information about this most critical barrier.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.
If applicable, please provide an example of how your office has used data to build evidence for policy making.

Attachment C. Detailed Survey Items and Skip Patterns from the CEP Survey of Federal Offices, 2017

Building Evidence from Data--Capacity and Needs in the Federal Government

There are 178 questions in this survey

U.S. Commission on Evidence-Based Policymaking Survey of Federal Offices

The U. S. Commission on Evidence-Based Policymaking, established by law in March 2016, is composed of 15 members appointed by the President and Congress. Its mission is to identify ways to strengthen the government's evidence-building efforts.

This survey of Federal offices is a critical part of the Commission's fact-finding. It is designed to help the Commission understand how Federal offices collect, analyze, and provide access to data and how their needs for evidence are addressed.

The section below defines a number of terms that recur in the survey. In many cases, these definitions are also repeated at the bottom of questions for your convenience.

Thank you for completing this survey on behalf of your Federal office.

Definitions

Confidential data: identifiable micro-level data that cannot be made public due to law, policy, or practice

Data linkage: the merging of two or more micro-level datasets originally collected for different purposes

Entity: any public, private, or nonprofit organization

Individual unit: the lowest level unit at which data are collected, such as people, households, businesses, nonprofit organizations, schools

Intermediary source: any public or private organization that collects data from individual units and sends them to a Federal office, such as state or local government agencies, postsecondary institutions, grantees, or law enforcement agencies

Micro-level data: a data file with an entry (record) for each individual unit

Primary job duties: duties performed more than 50% of full-time equivalent work hours

Statistical, evaluation, research, or policy analysis purposes: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

[]Which Federal agency are you responding for? *

Please choose **only one** of the following:

- Broadcasting Board of Governors
- Consumer Product Safety Commission
- Department of Agriculture
- Department of Commerce
- Department of Defense
- Department of Education
- Department of Energy
- Department of Health and Human Services
- Department of Homeland Security
- Department of Housing and Urban Development
- Department of Justice
- Department of Labor
- Department of State
- Department of the Interior
- Department of the Treasury
- Department of Transportation
- Department of Veterans Affairs
- Environmental Protection Agency
- Equal Employment Opportunity Commission
- General Services Administration
- Institute of Museum and Library Services
- National Aeronautics and Space Administration
- National Archives and Records Administration
- National Science Foundation
- Nuclear Regulatory Commission
- Office of Personnel Management
- Small Business Administration
- Social Security Administration
- US Agency for International Development
- Corporation for National and Community Service
- Millennium Challenge Corporation

[]Which office in the Department of Agriculture are you responding for? *

Only answer this question if the following conditions are met:
Answer was 'Department of Agriculture' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ⬤ Food and Nutrition Service
- ⬤ Farm Service Agency
- ⬤ Risk Management Agency
- ⬤ Forest Service
- ⬤ Natural Resources Conservation Service
- ⬤ Foreign Agricultural Service
- ⬤ National Institute of Food and Agriculture
- ⬤ Agricultural Research Service
- ⬤ Agricultural Marketing Service
- ⬤ Animal and Plant Health Inspection Service
- ⬤ Food Safety and Inspection Service
- ⬤ Rural Development - Rural Housing Service
- ⬤ Rural Development - Rural Utilities Service
- ⬤ National Agricultural Statistics Service
- ⬤ Economic Research Service
- ⬤ Grain Inspection, Packers and Stockyards Administration
- ⬤ Office of Civil Rights
- ⬤ World Agricultural Outlook Board
- ⬤ Chief Economist

[]Which office in the Department of Commerce are you responding for? *

Only answer this question if the following conditions are met:
Answer was 'Department of Commerce' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

○ National Oceanic and Atmospheric Administration - National Environmental Satellite Data and

Information Service

○ National Oceanic and Atmospheric Administration - National Marine Fisheries Service

○ National Oceanic and Atmospheric Administration - National Ocean Service

○ National Oceanic and Atmospheric Administration - National Weather Service

○ National Oceanic and Atmospheric Administration - Office of Marine and Aviation Operations

○ National Oceanic and Atmospheric Administration - Office of Oceanic and Atmospheric Research

○ Bureau of the Census

○ National Institute of Standards and Technology

○ National Telecommunications and Information Administration

○ International Trade Administration

○ Economic Development Administration

○ Bureau of Industry and Security

○ Economics and Statistics Administration (ex BEA and Census)

○ Minority Business Development Agency

○ National Technical Information Service

○ United States Travel and Tourism Administration

○ U.S. Patent and Trademark Office

○ Bureau of Economic Analysis

○ Office of Performance Evaluation and Risk Management

[]Which office in the Department of Defense are you responding for? *

Only answer this question if the following conditions are met:
Answer was 'Department of Defense' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

○ Office of the Assistant Secretary of Defense for Research and Engineering

○ Army Corps of Engineers

○ Defense Health Agency

○ Defense Manpower Data Center

[]Which office in the Department of Education are you responding for? *

Only answer this question if the following conditions are met:
Answer was 'Department of Education' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ○ Office of Federal Student Aid
- ○ Office of Elementary and Secondary Education
- ○ Office of Special Education and Rehabilitative Services
- ○ Office of Postsecondary Education
- ○ Office of Career, Technical, and Adult Education
- ○ Office of Innovation and Improvement
- ○ Office of English Language Acquisition
- ○ National Center for Education Research and National Center for Special Education Research
- ○ National Center for Education Statistics
- ○ National Center for Educational Evaluation
- ○ Office for Civil Rights
- ○ Office of Planning, Evaluation, and Policy Development

[]

Which office in the Department of Energy are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of Energy' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ○ National Nuclear Security Administration
- ○ Office of Science
- ○ Office of Energy Efficiency and Renewable Energy
- ○ Office of Fossil Energy
- ○ Office of Nuclear Energy
- ○ Office of Electricity Delivery and Energy Reliability
- ○ Advanced Research Projects Agency for Energy
- ○ Energy Information Administration
- ○ Office of Environment, Health, Safety and Security
- ○ Chief Information Officer

[]

Which office in the Department of Health and Human Services are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of Health and Human Services' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- Centers for Medicare and Medicaid Services - Office of Enterprise Data and Analytics
- Centers for Medicare and Medicaid Services - Center for Medicare and Medicaid Innovation
- Centers for Medicare and Medicaid Services - Office of the Director
- Office of Minority Health
- Administration for Children and Families - Office of Planning, Research, and Evaluation
- Administration for Children and Families - Office of Child Support Enforcement
- Administration for Children and Families - Office of Family Assistance
- Administration for Children and Families - Office of Community Services
- Administration for Children and Families - Administration on Children, Youth, and Families
- Administration for Children and Families - Office of Refugee Resettlement
- Administration for Children and Families - Office of Child Care
- Administration for Children and Families - Office of Head Start
- National Institutes of Health - National Institute on Aging
- National Institutes of Health - National Institute on Alcohol Abuse and Alcoholism
- National Institutes of Health - National Institute of Allergy and Infectious Diseases
- National Institutes of Health - National Institute of Biomedical Imaging and Bioengineering
- National Institutes of Health - National Institute of Child Health and Human Development
- National Institutes of Health - National Institute on Deafness and Other Communication Disorders
- National Institutes of Health - National Institute of Dental and Craniofacial Research
- National Institutes of Health - National Institute of Diabetes and Digestive and Kidney Diseases
- National Institutes of Health - National Institute on Drug Abuse
- National Institutes of Health - National Institute of Environmental Health Sciences
- National Institutes of Health - National Institute of General Medical Sciences
- National Institutes of Health - National Institute of Mental Health
- National Institutes of Health - National Cancer Institute
- National Institutes of Health - National Eye Institute
- National Institutes of Health - National Heart, Lung, and Blood Institute
- National Institutes of Health - National Human Genome Research Institute

- National Institutes of Health - National Center for Complementary and Integrative Health
- National Institutes of Health - NIH Clinical Center
- National Institutes of Health - NIH Center for Scientific Review
- National Institutes of Health - Fogarty International Center
- National Institutes of Health - National Center for Advancing Translational Sciences
- National Institutes of Health - National Institute of Arthritis and Musculoskeletal and Skin Diseases
- National Institutes of Health - National Institute on Minority Health and Health Disparities
- National Institutes of Health - National Institute of Neurological Disorders and Stroke
- National Institutes of Health - National Institute of Nursing Research
- National Institutes of Health - National Library of Medicine
- National Institutes of Health - NIH Office of Behavioral Health and Social Sciences Research
- National Institutes of Health - NIH Office of Disease Prevention
- National Institutes of Health - NIH Office of Program Evaluation and Performance
- National Institutes of Health - NIH Office of Research Infrastructure Programs
- National Institutes of Health - NIH Office of Research on Women's Health
- National Institutes of Health - NIH Office of Strategic Coordination
- National Institutes of Health - NIH Division of Program Coordination, Planning, and Strategic Initiatives
- National Institutes of Health - NIH Office of AIDS Research
- National Institutes of Health - NIH Office of Communications & Public Liaison
- National Institutes of Health - NIH Office of Extramural Research
- National Institutes of Health - NIH Office of Management
- National Institutes of Health - Office of Legislative Policy and Analysis
- National Institutes of Health - NIH Office of Science Policy
- Health Resources and Services Administration
- Centers for Disease Control and Prevention
- Centers for Disease Control and Prevention - Office of the Associate Director for Science
- Centers for Disease Control and Prevention - Office of the Associate Director for Policy
- Centers for Disease Control and Prevention - Program Performance and Evaluation Office, Office of the Director
- Centers for Disease Control and Prevention - National Center on Birth Defects and Developmental Disabilities
- Centers for Disease Control and Prevention - National Center for Chronic Disease Prevention and Health Promotion
- Centers for Disease Control and Prevention - National Center for Emerging Zoonotic and Infectious Diseases

Which office in the Department of Homeland Security are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of Homeland Security' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ◯ U.S. Customs and Border Protection
- ◯ Federal Emergency Management Agency
- ◯ U.S. Immigration and Customs Enforcement
- ◯ Transportation Security Administration
- ◯ Citizenship and Immigration Services
- ◯ National Protection and Programs Directorate
- ◯ Science and Technology Directorate
- ◯ Office of Policy
- ◯ Office of Policy - Office of Immigration Statistics

[]Which office in the Department of Housing and Urban Development do you represent? *

Only answer this question if the following conditions are met:
Answer was 'Department of Housing and Urban Development' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ◯ Asst. Sec. for Public and Indian Housing Programs
- ◯ Asst. Sec. for Housing Programs
- ◯ Asst. Sec. for Community Planning and Development
- ◯ Office of Lead Hazard Control and Healthy Homes
- ◯ Policy Development and Research
- ◯ Fair Housing and Equal Opportunity

[]

Which office in the Department of Justice are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of Justice' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ○ Federal Bureau of Investigation - Criminal Justice Information Service
- ○ Federal Bureau of Investigation - Office of the director
- ○ Bureau of Prisons
- ○ Office of Justice Programs - Bureau of Justice Statistics
- ○ Office of Justice Programs - National Institute of Justice
- ○ Office of Justice Programs - Office of Juvenile Justice and Delinquency Prevention
- ○ Office of Justice Programs - Bureau of Justice Assistance
- ○ Office of Justice Programs - Office of Victims of Crime
- ○ Office of Justice Programs - Office of Violence Against Women
- ○ Office of Community Oriented Policing Services
- ○ Drug Enforcement Administration
- ○ Bureau of Alcohol, Tobacco, Firearms, and Explosives

[]

Which office in the Department of Labor are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of Labor' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

○ Employment and Training Administration

○ Office of Workers' Compensation Programs

○ Occupational Safety and Health Administration

○ Bureau of Labor Statistics

○ Office of the Assistant Secretary for Policy - Chief Evaluation Office

○ Mine Safety and Health Administration

○ Wage and Hour Division

○ Employee Benefits Security Administration

[]

Which office in the Department of State are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of State' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

○ Evaluation and Aid Effectiveness Branch, Office of US Foreign Assistance Resources

○ Office of Policy and Planning

○ Office of the U.S. Global AIDS Coordinator

[]

Which office in the Department of the Interior are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of the Interior' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ○ National Park Service
- ○ Bureau of Indian Affairs and Bureau of Indian Education
- ○ United States Fish and Wildlife Service
- ○ Bureau of Land Management
- ○ Bureau of Reclamation
- ○ United States Geological Survey
- ○ Office of Surface Mining Reclamation and Enforcement
- ○ Bureau of Safety and Environmental Enforcement
- ○ Bureau of Ocean Energy Management
- ○ Office of Natural Resources Revenue

[]

Which office in the Department of the Treasury are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of the Treasury' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ○ Internal Revenue Service - Research, Analysis, and Statistics
- ○ Internal Revenue Service - Statistics of Income Division
- ○ Bureau of Fiscal Service
- ○ Alcohol and Tobacco Tax and Trade Bureau
- ○ Financial Crimes Enforcement Network
- ○ Bureau of Engraving and Printing
- ○ United States Mint
- ○ Federal Financing Bank

[]

Which office in the Department of the Transportation are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of Transportation' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ⚪ Federal Highway Administration
- ⚪ Federal Aviation Administration
- ⚪ Federal Transit Administration
- ⚪ Federal Railroad Administration
- ⚪ National Highway Traffic Safety Administration
- ⚪ Federal Motor Carrier Safety Administration
- ⚪ Maritime Administration
- ⚪ Pipeline and Hazardous Materials Safety Administration
- ⚪ Saint Lawrence Seaway Development Corporation
- ⚪ Bureau of Transportation Statistics
- ⚪ Surface Transportation Board

[]

Which office in the Department of Veterans Affairs are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Department of Veterans Affairs' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ⚪ Veterans Health Administration
- ⚪ National Cemetery Administration
- ⚪ National Center for Veterans Analysis and Statistics
- ⚪ Office of Policy and Planning
- ⚪ Veterans Benefits Administration

[]

Which office in the Environmental Protection Agency are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Environmental Protection Agency' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ○ Office of Policy - Office of Strategic Environmental Management (OSEM)
- ○ Office of Policy - National Center for Environmental Economics
- ○ Office of Water
- ○ Office of Air and Radiation
- ○ Office of Land and Emergency Management
- ○ Office of Chemical Safety and Pollution Prevention
- ○ Office of Enforcement and Compliance Assurance
- ○ Office of Environmental Information

[]

Which office in the National Science Foundation are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'National Science Foundation' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

- ○ Office of the Director
- ○ National Center for Science and Engineering Statistics
- ○ Office of Integrative Activities

[]

Which office in the Small Business Administration are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Small Business Administration' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

○ Office of Performance Management

○ Office of Advocacy

[]

Which office in the Social Security Administration are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Social Security Administration' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

○ Office of Research, Demonstration, and Employment Support

○ Office of Research, Evaluation, and Statistics

○ Office of Retirement Policy

○ Office of Income Security Programs

○ Office of Data Exchange and Policy Publications

○ Office of Disability policy

○ Office of the Actuary

[]

Which office in the US Agency for International Development are you responding for?

*

Only answer this question if the following conditions are met:
Answer was 'Corporation for National and Community Service' at question '1 [agency]' (Which Federal agency are you responding for?)

Please choose **only one** of the following:

◯   Office of Learning, Evaluation and Research, Bureau for Policy, Planning and Learning

[] In case we need to follow up with you, please provide your contact information: *

Please write your answer(s) here:

Name	
E-mail Address	
Phone Number	

[]

For the remainder of the survey, please note the following additional definitions:

My/your agency: **the Federal Agency or Department you marked in the first question**

*Another agency***: any Federal Agency or Department other than the one you marked in the first question**

*My/your office***: the Federal office you marked in the second question**

*Another office in my/your agency:***another Federal office within the Agency or Department you marked in the first question**

Representatives: **individuals who receive direction from, but are not directly employed by, your office or agency, including contractors, grantees, and those on interagency personnel agreements (IPAs)**

Approximately what percentage of your office's total annual budget is for *statistical, evaluation, research, or policy analysis purposes?*

Please choose **only one** of the following:

- ⊙ 0 percent
- ⊙ 1 to 10 percent
- ⊙ 11 to 50 percent
- ⊙ 51 to 90 percent
- ⊙ 91 to 100 percent

Statistical, evaluation, research, or policy analysis purposes: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

[]

Collecting Data

Does your office, or its *representatives*, collect data about *individual units* (e.g., people, businesses, nonprofit organizations, schools) either directly or through an *intermediary source* (e.g., state or local governments, private entities)?

*

Please choose **only one** of the following:

○ Yes, routinely (as a regular part of our programs or processes)

○ Yes, occasionally (not as a regular part of our programs or processes)

○ No

> *Individual unit*: the lowest level unit at which data are collected, such as people, households, businesses, nonprofit organizations, schools. *Intermediary source:* any public or private organization that collects data from individual units and sends them to a Federal office, such as state or local government agencies, postsecondary institutions, grantees, or law enforcement agencies.

[] Approximately what percentage of your office's total annual budget is for collecting data from *individual units*?

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?)

Please choose **only one** of the following:

○ 0 percent

○ 1 to 10 percent

○ 11 to 50 percent

○ 51 to 90 percent

○ 91 to 100 percent

> *Individual unit*: the lowest level unit at which data are collected, such as people, households, businesses, nonprofit organizations, schools.

[]For which of the following purposes does your office, or its representatives, collect data from *individual units*?   *

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?)

Please choose **all** that apply:

☐ To produce statistics about the economy, society, or environment

☐ To evaluate a program to understand its implementation or impact on participants

☐ To support research on a population, group of entities, policy, or program

☐ To conduct analysis of existing policies or programs to assist decision making

☐ To conduct or support program operations

☐ To monitor program or grant performance

☐ Other: [   ]

> *Individual unit*: the lowest level unit at which data are collected, such as people, households, businesses, nonprofit organizations, schools.

[]Are any of the data collected by your office, or its representatives, considered *confidential*?   *

Only answer this question if the following conditions are met:
Answer was 'Yes, routinely (as a regular part of our programs or processes) ' *or* 'Yes, occasionally (not as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?)

Please choose **only one** of the following:

○ Yes

○ No

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Who analyzes your office's *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '27 [confidential6]' (Are any of the data collected by your office, or its representatives, considered confidential?)

Please choose **all** that apply:

☐ Staff physically present in my office

☐ Staff working in a location other than my office (including teleworking)

☐ Contractors physically present in my office

☐ Contractors working in a location other than my office

☐ Staff or contractors in another office in my agency

☐ Staff or contractors in another agency

☐ My office's grantees

☐ Researchers outside of the Federal government

☐ Other: [   ]

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]

Analyzing Micro-Level Data From Another Agency

Does your office, or its representatives, analyze *micro-level data* collected by any other Federal office or agency?

*

Only answer this question if the following conditions are met:
Answer was 'No' *or* 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?)

Please choose **only one** of the following:

◯ Yes

◯ No

> *Micro-level data*: a data file with an entry (record) for each individual unit.

[]Which of the following kinds of *micro-level data* collected by any other office or agency does your office, or its representatives, analyze?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '29 [micro8]' (Analyzing Micro-Level Data From Another Agency Does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?)

Please choose **all** that apply:

☐ Criminal justice data

☐ Decennial Census/American Community Survey (ACS)

☐ Education data (Federal)

☐ Education data (State or Private)

☐ Federal data on business program participation

☐ Federal establishment survey data (e.g., Economic and Agricultural Censuses)

☐ Federal tax data

☐ Federal social security data

☐ Human services program data (e.g., SNAP and TANF)

☐ Medicaid/Medicare claims and utilization data

☐ Military service and veteran benefits records

☐ State unemployment insurance wage record data

☐ Vital records (birth and death) data

☐ None of the above

☐ Other: _____

Micro-level data: a data file with an entry (record) for each individual unit.

[]For which of the following purposes does your office, or its representatives, analyze *micro-level data* collected by any other Federal office or agency? *

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '29 [micro8]' (Analyzing Micro-Level Data From Another Agency Does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?)

Please choose **all** that apply:

☐ To produce statistics about the economy, society, or environment

☐ To evaluate a program to understand its implementation or impact on participants

☐ To support research on a population, group of entities, policy, or program

☐ To conduct analysis of existing policies or programs to assist decision making

☐ To conduct or support program operations

☐ To monitor program or grant performance

☐ Other: [   ]

> *Micro-level data:* a data file with an entry (record) for each individual unit.

[]

Linking Data

Does your office, or its representatives, link the *confidential data* it collects with data from another agency?

***

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?) *and* Answer was 'Yes' at question '27 [confidential6]' (Are any of the data collected by your office, or its representatives, considered confidential?)

Please choose **only one** of the following:

○ Yes

○ No

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[ ]Which of the following kinds of data does your office, or its representatives, link with your *confidential data* collected from *individual units*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **all** that apply:

☐ Criminal justice data

☐ Decennial Census/American Community Survey (ACS)

☐ Education data (Federal)

☐ Education data (State or Private)

☐ Federal data on business program participation

☐ Federal establishment survey data (e.g., Economic and Agricultural Censuses)

☐ Federal tax data

☐ Federal social security data

☐ Human services program data (e.g., SNAP and TANF)

☐ Medicaid/Medicare claims and utilization data

☐ Military service and veteran benefits records

☐ State unemployment insurance wage record data

☐ Vital records (birth and death) data

☐ None of the above

☐ Other: _____

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.
> *Individual unit*: the lowest level unit at which data are collected, such as people, households, businesses, nonprofit organizations, schools.

[ ]Which of the following best describes your process for linking to Criminal justice data?

Only answer this question if the following conditions are met:
Answer was 'Criminal justice data' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: _____

[]

Which of the following best describes your process for linking to Decennial Census/American Community Survey (ACS) data?

Only answer this question if the following conditions are met:
Answer was 'Decennial Census/American Community Survey (ACS)' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Education data (Federal)?

Only answer this question if the following conditions are met:
Answer was 'Education data (Federal)' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Education data (State)?

Only answer this question if the following conditions are met:
Answer was 'Education data (State or Private)' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Federal data on business program participation?

Only answer this question if the following conditions are met:
Answer was 'Federal data on business program participation' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Federal establishment survey data (e.g. Economic and Agricultural Censuses)?

Only answer this question if the following conditions are met:
Answer was 'Federal establishment survey data (e.g., Economic and Agricultural Censuses)' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Federal tax data?

Only answer this question if the following conditions are met:
Answer was 'Federal tax data' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Federal social security data?

Only answer this question if the following conditions are met:
Answer was 'Federal social security data' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐   Our office, or its representatives, does the linkage.

☐   Another office or agency, or its representatives, does the linkage.

☐   A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Human services program data (e.g. SNAP and TANF)?

Only answer this question if the following conditions are met:
Answer was 'Human services program data (e.g., SNAP and TANF)' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐   Our office, or its representatives, does the linkage.

☐   Another office or agency, or its representatives, does the linkage.

☐   A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Medicaid/Medicare claims and utilization data?

Only answer this question if the following conditions are met:
Answer was 'Medicaid/Medicare claims and utilization data' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Military service and veteran benefits records?

Only answer this question if the following conditions are met:
Answer was 'Military service and veteran benefits records' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to State unemployment insurance wage record data?

Only answer this question if the following conditions are met:
Answer was 'State unemployment insurance wage record data' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[]

Which of the following best describes your process for linking to Vital records (birth and death) data?

Only answer this question if the following conditions are met:
Answer was 'Vital records (birth and death) data' at question '33 [link13]' (Which of the following kinds of data does your office, or its representatives, link with your confidential data collected from individual units?)

Please choose **all** that apply:

☐ Our office, or its representatives, does the linkage.

☐ Another office or agency, or its representatives, does the linkage.

☐ A third party, or its representatives, does the linkage.

☐ Other: [   ]

[ ]Does your office have staff or contractors whose *primary job duties* involve the technical process of *data linkage*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **only one** of the following:

○ Yes

○ No

> *Primary job duties*: duties performed more than 50% of full-time equivalent work hours. *Data linkage*: the merging of two or more micro-level datasets originally collected for different purposes.

[ ]How many staff or contractors does your office have whose *primary job duties* involve the technical process of *data linkage*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '47 [linkstaff18]' (Does your office have staff or contractors whose primary job duties involve the technical process of data linkage?)

Please choose **only one** of the following:

○ 1 to 2

○ 3 to 5

○ 6 to 10

○ More than 10

> *Primary job duties*: duties performed more than 50% of full-time equivalent work hours. *Data linkage*: the merging of two or more micro-level datasets originally collected for different purposes.

[]Which of the following statements best describes the regularity of *data linkage* in your office?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **only one** of the following:

○ All of our data linkages are for ad hoc projects.

○ Most of our data linkages are for ad hoc projects; a few are a part of our regular processes.

○ Our data linkages are about evenly split between ad hoc projects and regular processes.

○ Most of our data linkages are a part of our regular process; a few are ad hoc projects

○ All of our data linkages are part of our regular processes.

> *Data linkage*: the merging of two or more micro-level datasets originally collected for different purposes.

[]How does your office pay for *data linkage*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **all** that apply:

☐ My office has a specific budget allocation that covers data linkage.

☐ My office chooses to set aside a portion of the budget to help pay for data linkage.

☐ Programs within my office that do data linkage absorb the cost in their budgets.

☐ Other offices provide funds for data linkages.

☐ User fees help pay for data linkage.

☐ Other: [   ]

> *Data linkage*: the merging of two or more micro-level datasets originally collected for different purposes.

[]Which of the following does your office, or its representatives, use for *data linkage?*

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **all** that apply:

☐ A probabilistic match of key characteristics.

☐ A linking key (personal identifier).

☐ A combination of probabilistic matching and linking keys.

☐ Don't know

☐ Other: _____

> *Data linkage*: the merging of two or more micro-level datasets originally collected for different purposes.

[]Which of the following keys does your office, or its representatives, use for *data linkage*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **all** that apply:

☐ Social Security Number (SSN)

☐ Masked SSN

☐ Employer Identification Number (EIN)

☐ Name

☐ Address

☐ Date of Birth

☐ Biometrics (e.g., fingerprints)

☐ Don't know

☐ Other: _____

> *Data linkage*:the merging of two or more micro-level datasets originally collected for different purposes.

[]How does your office, or its representatives, secure data linking keys?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **all** that apply:

☐ By restricting access to the linkage key or linkage key crosswalk.

☐ By generating a pseudo-anonymous key (e.g., hash, unique ID, etc) for linking.

☐ By generating a different pseudo-anonymous key (e.g., hash, unique ID, etc) for each linkage or for

each data source.

☐ By removing the linkage key from the file(s) once linkage is complete.

☐ Don't know

☐ Other: [_____]

[]Does your office, or its representatives, keep *micro-level data* that are linked for *statistical, research, evaluation, or policy analysis purposes* so they can be analyzed again at a later time?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '32 [link12]' (Linking Data Does your office, or its representatives, link the confidential data it collects with data from another agency?)

Please choose **only one** of the following:

○ Yes, routinely (as a regular part of our programs or processes)

○ Yes, occasionally (not as a regular part of our programs or processes)

○ No

> *Micro-level data:* a data file with an entry (record) for each individual unit. *Statistical, evaluation, research, or policy analysis purposes*: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

[]

Accessing Data

Does another agency, or its representatives,ever access your office's *confidential data* for its own *statistical, evaluation, research, or policy analysis purposes*?

*

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?) *and* Answer was 'Yes' at question '27 [confidential6]' (Are any of the data collected by your office, or its representatives, considered confidential?)

Please choose **only one** of the following:

○ Yes

○ No

> **Confidential data**: identifiable micro-level data that cannot be made public due to law, policy, or practice.
> **Statistical, evaluation, research, or policy analysis purposes**: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

[]How does another agency, or its representatives, access your office's *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '55 [access27]' (Accessing Data Does another agency, or its representatives, ever access your office's confidential data for its own statistical, evaluation, research, or policy analysis purposes?)

Please choose **all** that apply:

☐ Staff or contractors come onsite to my office or agency to access the data.

☐ Through a Federal Statistical Research Data Center (FSRDC)

☐ Through a distributed thin client Citrix or VPN network

☐ Through a Memorandum of Understanding (MOU), license, or contract agreement

☐ Through a data archive (e.g., Interuniversity Consortium for Political and Social Research)

☐ Other: _____

> **Confidential data**: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Approximately how many other agencies, or their representatives, access your office's *confidential data* each year*?*

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '55 [access27]' (Accessing Data Does another agency, or its representatives, ever access your office's confidential data for its own statistical, evaluation, research, or policy analysis purposes?)

Please choose **only one** of the following:

○ 1 to 2

○ 3 to 5

○ 6 to 10

○ More than 10

> ***Confidential data***: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Which of the following statements best describes how regularly another agency*, or its representatives, access your office's *confidential data*?**

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '55 [access27]' (Accessing Data Does another agency, or its representatives, ever access your office's confidential data for its own statistical, evaluation, research, or policy analysis purposes?)

Please choose **only one** of the following:

○ Many other agencies routinely (e.g., annually, quarterly, monthly) access my office's confidential

data.

○ A few other agencies routinely (e.g., annually, quarterly, monthly) access my office's confidential

data.

○ Many other agencies occasionally (i.e. on an ad hoc basis) access my office's confidential data.

○ A few other agencies occasionally (i.e. on an ad hoc basis) access my office's confidential data.

○ Some agencies routinely (e.g., annually, quarterly, monthly) and some agencies occasionally (i.e. on

an ad hoc basis) access my office's confidential data.

> ***Confidential data***: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Do researchers outside of the Federal government ever access your office's *confidential data***? ***

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?) *and* Answer was 'Yes' at question '27 [confidential6]' (Are any of the data collected by your office, or its representatives, considered confidential?)

Please choose **only one** of the following:

○ Yes

○ No

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Approximately how many outside researchers access your office's *confidential data***each year***?*

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '59 [outside30]' (Do researchers outside of the Federal government ever access your office's confidential data?)

Please choose **only one** of the following:

○ 1 to 10

○ 11 to 50

○ 51 to 100

○ More than 100

> *Confidential data*: micro-level data deemed sensitive because it could potentially identify individual units.

[]How do researchers outside of the Federal government access your office's *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '59 [outside30]' (Do researchers outside of the Federal government ever access your office's confidential data?)

Please choose **all** that apply:

☐ The researcher comes onsite to my office or agency to access the data.

☐ Through a Federal Statistical Research Data Center (FSRDC)

☐ Through a distributed thin client Citrix or VPN network

☐ Through a license or contract agreement with researchers and their institutions

☐ Through a data archive (e.g., Interuniversity Consortium for Political and Social Research)

☐ Other: _____

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Does your office receive and review requests from outside researchers for access to *confidential data*? *

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '59 [outside30]' (Do researchers outside of the Federal government ever access your office's confidential data?)

Please choose **only one** of the following:

◯ Yes

◯ No

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]How often does your office receive new requests from outside researchers for access to *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '62 [review32]' (Does your office receive and review requests from outside researchers for access to confidential data?)

Please choose **only one** of the following:

○ Daily

○ Weekly

○ Monthly

○ Yearly

○ Sporadically

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Which of the following statements best describes how regularly outside researchers access your office's *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '59 [outside30]' (Do researchers outside of the Federal government ever access your office's confidential data?)

Please choose **only one** of the following:

○ Many outside researchers routinely (e.g. annually, quarterly, monthly) access my office's confidential data.

○ A few outside reseachers routinely (e.g. annually, quarterly, monthly) access my office's confidential data.

○ Many outside researchers occasionally (i.e. on an ad hoc basis) access my office's confidential data.

○ A few outside researchers occasionally (i.e. on an ad hoc basis) access my office's confidential data.

○ Some outside researchers routinely (e.g. annually, quarterly, monthly) and some outside researchers occasionally (i.e. on an ad hoc basis) access my office's confidential data.

> *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Does your office have staff or contractors whose *primary job duties* involve reviewing and processing outside researcher requests for access to *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '62 [review32]' (Does your office receive and review requests from outside researchers for access to confidential data?)

Please choose **only one** of the following:

○ Yes

○ No

Primary job duties: duties performed more than 50% of full-time equivalent work hours. *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]How many staff or contractors does your office have whose *primary job duties* involve reviewing and processing outside researcher requests for access to *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '65 [prim35]' (Does your office have staff or contractors whose primary job duties involve reviewing and processing outside researcher requests for access to confidential data?)

Please choose **only one** of the following:

○ 1 to 2

○ 3 to 5

○ 6 to 10

○ More than 10

Primary job duties: duties performed more than 50% of full-time equivalent work hours. *Confidential data*: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Does your office have a system for tracking requests from outside researchers for access to *confidential data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '62 [review32]' (Does your office receive and review requests from outside researchers for access to confidential data?)

Please choose **only one** of the following:

○ Yes

○ No

Confidential data: identifiable micro-level data that cannot be made public due to law, policy, or practice.

[]Does your office have a process for reviewing output produced by outside researchers to prevent disclosure of the identities of *individual units*? *

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '62 [review32]' (Does your office receive and review requests from outside researchers for access to confidential data?)

Please choose **only one** of the following:

○ Yes

○ No

Individual unit: the lowest level unit at which data are collected, such as people, households, businesses, nonprofit organizations, schools.

[]How often does your office receive new requests for disclosure review of outside researcher analyses?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '68 [outrev37]' (Does your office have a process for reviewing output produced by outside researchers to prevent disclosure of the identities of individual units?)

Please choose **only one** of the following:

○ Daily

○ Weekly

○ Monthly

○ Yearly

○ Sporadically

[]Does your office have a process for documenting the results of disclosure review of outside researcher analyses?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '68 [outrev37]' (Does your office have a process for reviewing output produced by outside researchers to prevent disclosure of the identities of individual units?)

Please choose **only one** of the following:

○ Yes

○ No

[]Does your office have staff or contractors whose *primary job duties* involve disclosure review of outside researcher analyses?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '68 [outrev37]' (Does your office have a process for reviewing output produced by outside researchers to prevent disclosure of the identities of individual units?)

Please choose **only one** of the following:

○ Yes

○ No

Primary job duties: duties performed more than 50% of full-time equivalent work hours.

[]How many staff or contractors does your office have whose *primary job duties* involve disclosure review of outside researcher analyses?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '71 [staff39]' (Does your office have staff or contractors whose primary job duties involve disclosure review of outside researcher analyses?)

Please choose **only one** of the following:

○ 1 to 2

○ 3 to 5

○ 6 to 10

○ More than 10

○ Other _____

Primary job duties: duties performed more than 50% of full-time equivalent work hours.

[]Does your office, or its representatives, typically create metadata or technical documentation for the data it produces that includes the following?

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?)

Please choose the appropriate response for each item:

	Yes	No
Variable definitions, units of measurement, and response ranges	○	○
Changes to definitions, scope, or data collection processes over time	○	○
Imputation procedures or other edits to the data	○	○

[]

Managing Historical Data

Does your office, or its representatives, have a process for archiving, managing, and retrieving your historical *micro-level data*?

*

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?)

Please choose **only one** of the following:

○ Yes

○ No

Micro-level data: a data file with an entry (record) for each individual unit.

[]Does your office have staff or contractors whose *primary job duties* involve archiving, managing, and retrieving your historical *micro-level data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '74 [arch41]' (Managing Historical Data Does your office, or its representatives, have a process for archiving, managing, and retrieving your historical micro-level data?)

Please choose **only one** of the following:

○ Yes

○ No

> *Primary job duties*: duties performed more than 50% of full-time equivalent work hours. *Micro-level data:* a data file with an entry (record) for each individual unit.

[]How many staff or contractors does your office have whose *primary job duties* involve archiving, managing, and retrieving your historical *micro-level data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '75 [hist42]' (Does your office have staff or contractors whose primary job duties involve archiving, managing, and retrieving your historical micro-level data?)

Please choose **only one** of the following:

○ 1 to 2

○ 3 to 5

○ 6 to 10

○ More than 10

> *Micro-level data:* a data file with an entry (record) for each individual unit. *Primary job duties*: duties performed more than 50% of full-time equivalent work hours.

[] Does your office, or its representatives, continue to manage or clean your historical *micro-level data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '74 [arch41]' (Managing Historical Data Does your office, or its representatives, have a process for archiving, managing, and retrieving your historical micro-level data?)

Please choose **only one** of the following:

○ Yes

○ No

> *Micro-level data:* a data file with an entry (record) for each individual unit.

[]How easy or difficult is it for your office, or its representatives, to retrieve and use your historical *micro-level data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '74 [arch41]' (Managing Historical Data Does your office, or its representatives, have a process for archiving, managing, and retrieving your historical micro-level data?)

Please choose **only one** of the following:

○ very easy

○ somewhat easy

○ somewhat difficult

○ very difficult

Micro-level data: a data file with an entry (record) for each individual unit.

[]When does your office, or its representatives, destroy your historical *micro-level data*?

Only answer this question if the following conditions are met:
Answer was 'Yes' at question '74 [arch41]' (Managing Historical Data Does your office, or its representatives, have a process for archiving, managing, and retrieving your historical micro-level data?)

Please choose **all** that apply:

☐ We archive all historical micro-level data.

☐ We destroy historical micro-level data when they are no longer being used for the purpose for which they were collected.

☐ We destroy historical micro-level data on a schedule established by statute, regulation, or policy.

☐ We destroy historical micro-level data when they are no longer relevant for research or policy analysis.

☐ We destroy historical micro-level data when we can no longer support their antiquated data structure.

☐ Other: [   ]

Micro-level data: a data file with an entry (record) for each individual unit.

[]

Using Data for Statistical, Evaluation, Research, or Policy Analysis Purposes

---

Which of the following kinds ofdata has your office, or its representatives, considered using for *statistical, evaluation, research, or policy analysis purposes* but did not because it was too hard to get access to the specific dataset you needed?

Only answer this question if the following conditions are met:

-------- Scenario 1 --------

Answer was 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To produce statistics about the economy, society, or environment ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '26 [purpose5]' (For which of the following purposes does your office, or its representatives, collect data from individual units?)

-------- or Scenario 2 --------

Answer was 'To produce statistics about the economy, society, or environment ' *or* 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '31 [micropurpose10]' (For which of the following purposes does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?)

-------- or Scenario 3 --------

Answer was '91 to 100 percent ' *or* '51 to 90 percent' *or* '11 to 50 percent' *or* '1 to 10 percent' at question '23 [SERA46]' (For the remainder of the survey, please note the following additional definitions: My/your agency: the Federal Agency or Department you marked in the first question Another agency: any Federal Agency or Department other than the one you marked in the first question My/your office: the Federal office you marked in the second question   Another office in my/your agency: another Federal office within the Agency or Department you marked in the first question   Representatives: individuals who receive direction from, but are not directly employed by, your office or agency, including contractors, grantees, and those on interagency personnel agreements (IPAs) Approximately what percentage of your office's total annual budget is for statistical, evaluation, research, or policy analysis purposes?   )

Please choose **all** that apply:

- ☐ Criminal justice data
- ☐ Decennial Census/American Community Survey (ACS)
- ☐ Education data (Federal)
- ☐ Education data (State or Private)
- ☐ Federal data on business program participation
- ☐ Federal establishment survey data (e.g., Economic and Agricultural Censuses)
- ☐ Federal tax data
- ☐ Federal social security data
- ☐ Human services program data (e.g., SNAP and TANF)
- ☐ Medicaid/Medicare claims and utilization data
- ☐ Military service and veteran benefits records
- ☐ State unemployment insurance wage record data

☐ Vital records (birth and death) data

☐ None of the above

Statistical, evaluation, research, or policy analysis purposes: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

[]Which of the following factors made it hard for your office to get access to Criminal justice data? *

Only answer this question if the following conditions are met:
Answer was 'Criminal justice data' at question '80 [notlink14]' (Using Data for Statistical, Evaluation, Research, or Policy Analysis Purposes Which of the following kinds of data has your office, or its representatives, considered using for statistical, evaluation, research, or policy analysis purposes but did not because it was too hard to get access to the specific dataset you needed?)

Please choose **all** that apply:

☐ Lack of staff, policies, and procedures to establish data sharing agreements

☐ Statutes prohibiting data sharing

☐ Regulations or policies that make it difficult to link data

☐ Lack of capacity in information technology systems

☐ Lack of staff or contractors with specific technical expertise needed to link data

☐ Concerns about keeping the linked data secure and confidential

☐ Other: [   ]

[]

Was the lack of staff, policies, and procedures to establish data sharing agreements:

Only answer this question if the following conditions are met:
Answer was 'Lack of staff, policies, and procedures to establish data sharing agreements ' at question '81 [cjac15]' (Which of the following factors made it hard for your office to get access to Criminal justice data?)

Please choose **all** that apply:

☐ In your office?

☐ In another office in your agency?

☐ In another agency?

☐ At the state or local level?

[]

Were the statutes prohibiting data sharing:

Only answer this question if the following conditions are met:
Answer was 'Statutes prohibiting data sharing ' at question '81 [cjac15]' (Which of the following factors made it hard for your office to get access to Criminal justice data?)

Please choose **all** that apply:

☐ In your office?

☐ In another office in your agency?

☐ In another agency?

☐ At the state or local level?

[]

Were the regulations or policies that make it difficult to link data:

Only answer this question if the following conditions are met:
Answer was 'Regulations or policies that make it difficult to link data ' at question '81 [cjac15]' (Which of the following factors made it hard for your office to get access to Criminal justice data?)

Please choose **all** that apply:

☐ In your office?

☐ In another office in your agency?

☐ In another agency?

☐ At the state or local level?

[]

Was the lack of capacity in information technology systems:

Were the concerns about keeping the linked data secure and confidential:

Only answer this question if the following conditions are met:
Answer was 'Concerns about keeping the linked data secure and confidential ' at question '165 [vitac15]' (Which of the following factors made it hard for your office to get access to Vital records (birth and death) data?)

Please choose **all** that apply:

- ☐ In your office?
- ☐ In another office in your agency?
- ☐ In another agency?
- ☐ At the state or local level?

[]To what extent is each of the following a barrier to your office's ability to use datafor *statistical, evaluation, research, or policy analysis purposes*?

Only answer this question if the following conditions are met:

-------- Scenario 1 --------

Answer was 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To produce statistics about the economy, society, or environment ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '26 [purpose5]' (For which of the following purposes does your office, or its representatives, collect data from individual units?)

-------- or Scenario 2 --------

Answer was 'To produce statistics about the economy, society, or environment ' *or* 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '31 [micropurpose10]' (For which of the following purposes does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?)

-------- or Scenario 3 --------

Answer was '51 to 90 percent' *or* '11 to 50 percent' *or* '1 to 10 percent' *or* '91 to 100 percent ' at question '23 [SERA46]' (For the remainder of the survey, please note the following additional definitions: My/your agency: the Federal Agency or Department you marked in the first question Another agency: any Federal Agency or Department other than the one you marked in the first question My/your office: the Federal office you marked in the second question   Another office in my/your agency: another Federal office within the Agency or Department you marked in the first question   Representatives: individuals who receive direction from, but are not directly employed by, your office or agency, including contractors, grantees, and those on interagency personnel agreements (IPAs) Approximately what percentage of your office's total annual budget is for statistical, evaluation, research, or policy analysis purposes?   )

Please choose the appropriate response for each item:

	Not a barrier	Minor barrier	Moderate barrier	Major barrier
Lack of ability to hire appropriate staff	○	○	○	○
Lack of ability to execute and manage contracts	○	○	○	○
Inadequate funding	○	○	○	○
Legal limitations	○	○	○	○
Information Technology (IT) systems or requirements	○	○	○	○

Political processes (e.g., transitions in agency/office leadership, Congressional oversight)	○	○	○	○
Information collection	○	○	○	○

	Not a barrier	Minor barrier	Moderate barrier	Major barrier
requirements (e.g., Paperwork Reduction Act and Institutional Review Boards)				
Other	⊙	⊙	⊙	⊙

> ***Statistical, evaluation, research, or policy analysis purposes***: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

[]If other, please specify:

Only answer this question if the following conditions are met:
Answer was 'Minor barrier' *or* 'Moderate barrier' *or* 'Major barrier' at question '172 [SERA49]' (To what extent is each of the following a barrier to your office's ability to use data for statistical, evaluation, research, or policy analysis purposes? (Other))

Please write your answer here:

[]Which ONE of the following is the most critical barrier to your office's ability to use data for *statistical, evaluation, research, or policy analysis purposes*?

Only answer this question if the following conditions are met:

-------- Scenario 1 --------

Answer was 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To produce statistics about the economy, society, or environment ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '26 [purpose5]' (For which of the following purposes does your office, or its representatives, collect data from individual units?)

-------- or Scenario 2 --------

Answer was 'To produce statistics about the economy, society, or environment ' *or* 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '31 [micropurpose10]' (For which of the following purposes does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?)

-------- or Scenario 3 --------

Answer was '91 to 100 percent ' *or* '51 to 90 percent' *or* '11 to 50 percent' *or* '1 to 10 percent' at question '23 [SERA46]' (For the remainder of the survey, please note the following additional definitions: My/your agency: the Federal Agency or Department you marked in the first question Another agency: any Federal Agency or Department other than the one you marked in the first question My/your office: the Federal office you marked in the second question   Another office in my/your agency: another Federal office within the Agency or Department you marked in the first question   Representatives: individuals who receive direction from, but are not directly employed by, your office or agency, including contractors, grantees, and those on interagency personnel agreements (IPAs) Approximately what percentage of your office's total annual budget is for statistical, evaluation, research, or policy analysis purposes?)

Please choose **only one** of the following:

○ Lack of ability to hire appropriate staff

○ Lack of ability to execute and manage contracts

○ Inadequate funding

○ Legal limitations

○ Information Technology (IT) systems or requirements

○ Privacy and data security requirements

○ Political processes (e.g., transitions in agency/office leadership, Congressional oversight)

○ Information collection requirements (e.g., Paperwork Reduction Act and Institutional Review Boards)

○ Other [   ]

> *Statistical, evaluation, research, or policy analysis purposes*: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

[]If applicable, please provide additional information about this most critical barrier.

Only answer this question if the following conditions are met:

-------- Scenario 1 --------

Answer was 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' *or* 'To produce statistics about the economy, society, or environment ' *or* 'To evaluate a program to understand its implementation or impact on participants ' at question '26 [purpose5]' (For which of the following purposes does your office, or its representatives, collect data from individual units?)

-------- or Scenario 2 --------

Answer was 'To produce statistics about the economy, society, or environment ' *or* 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '31 [micropurpose10]' (For which of the following purposes does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?)

-------- or Scenario 3 --------

Answer was '91 to 100 percent ' *or* '51 to 90 percent' *or* '11 to 50 percent' *or* '1 to 10 percent' at question '23 [SERA46]' (For the remainder of the survey, please note the following additional definitions: My/your agency: the Federal Agency or Department you marked in the first question Another agency: any Federal Agency or Department other than the one you marked in the first question My/your office: the Federal office you marked in the second question   Another office in my/your agency: another Federal office within the Agency or Department you marked in the first question   Representatives: individuals who receive direction from, but are not directly employed by, your office or agency, including contractors, grantees, and those on interagency personnel agreements (IPAs) Approximately what percentage of your office's total annual budget is for statistical, evaluation, research, or policy analysis purposes?   )

Please write your answer here:

[]If applicable, please list up to five *statistical, evaluation, research, or policy analysis activities* your office, or its representatives, have not been able to complete because it was too hard to access the right data.

Only answer this question if the following conditions are met:

-------- Scenario 1 --------

Answer was 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' *or* 'To produce statistics about the economy, society, or environment ' *or* 'To evaluate a program to understand its implementation or impact on participants ' at question '26 [purpose5]' (For which of the following purposes does your office, or its representatives, collect data from individual units?)

-------- or Scenario 2 --------

Answer was 'To evaluate a program to understand its implementation or impact on participants ' *or* 'To produce statistics about the economy, society, or environment ' *or* 'To support research on a population, group of entities, policy, or program' *or* 'To conduct analysis of existing policies or programs to assist decision making ' at question '31 [micropurpose10]' (For which of the following purposes does your office, or its representatives, analyze micro-level data collected by any other Federal office or agency?)

-------- or Scenario 3 --------

Answer was '91 to 100 percent ' *or* '51 to 90 percent' *or* '11 to 50 percent' *or* '1 to 10 percent' at question '23 [SERA46]' (For the remainder of the survey, please note the following additional definitions: My/your agency: the Federal Agency or Department you marked in the first question Another agency: any Federal Agency or Department other than the one you marked in the first question My/your office: the Federal office you marked in the second question   Another office in my/your agency: another Federal office within the Agency or Department you marked in the first question   Representatives: individuals who receive direction from, but are not directly employed by, your office or agency, including contractors, grantees, and those on interagency personnel agreements (IPAs) Approximately what percentage of your office's total annual budget is for statistical, evaluation, research, or policy analysis purposes?   )

Please write your answer here:

Statistical, evaluation, research, or policy analysis purposes: activities intended to support the production, analysis, and dissemination of information, including the creation and analysis of federal statistics; production or use of evaluation for federally-supported or -directed programs; research on a population, group of entities, policy, or program; or analysis of policies or proposals to inform decision making. These purposes do NOT include program operations (e.g., compliance monitoring, eligibility determinations, enforcement actions).

MAX Survey - Building Evidence from Data--Capacity and Needs in the Federal Gove...   Page 90 of 92

[]If applicable, please provide an example of a*micro-level data* linkageproject or process in your office that works well.

Only answer this question if the following conditions are met:
Answer was 'Yes, occasionally (not as a regular part of our programs or processes) ' *or* 'Yes, routinely (as a regular part of our programs or processes) ' at question '24 [collect3]' (Collecting Data Does your office, or its representatives, collect data about individual units (e.g., people, businesses, nonprofit organizations, schools) either directly or through an intermediary source (e.g., state or local governments, private entities)?)

Please write your answer here:

Micro-level data: a data file with an entry (record) for each individual unit.

[]If applicable, please provide an example of how your office has used data to build evidence for policy making.

Please write your answer here:

Submit your survey.
Thank you for completing this survey.

Attachment D. Federal Office Reponses to Open-Ended Questions on the CEP Survey of Federal Offices, 2017

Survey response	
Which Federal agency are you responding for?	Social Security Administration Office of Retirement Policy
If applicable, please provide additional information about this most critical barrier.	It is often a time-consuming process to get clearances from multiple agencies to use their data merged with SSA data.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Our office uses the MINT model (Modeling Income in the Near Term model) to analyze the distributional consequences of proposed Social Security changes. The basis of the model is SIPP data (Census Bureau data) merged with SSA earnings data.

Survey response	
Which Federal agency are you responding for?	Department of Veterans Affairs National Center for Veterans Analysis and Statistics
If applicable, please provide additional information about this most critical barrier.	It is often not the actual law or policy, but a risk adverse application of law or policy.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	Linking Veteran data to IRS data to ascertain the veteran outcomes by looking at income as a proxy.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	We provide a predictive model of the future Veteran population. We collect administrative data from within VA, integrate force projections and separations from DoD to estimate the future Veteran population. This model is used in VA strategic planning and as input to VHA's healthcare enrollee projection model which is issued in health policy and budget formulation.

Survey response	
Which Federal agency are you responding for?	Department of the Interior United States Geological Survey
If applicable, please provide additional information about this most critical barrier.	Funding is often not available for historical data digitization and necessary investments in information technology infrastructure.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	Field records from retiring scientists, historical data on tapes related to earth science, bird banding data, historical topographic maps
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	In the last several years, USGS has been developing a national biodiversity observation network, the USA National Phenology Network (www.usanpn.org), including the production of data products related to biodiversity and environmental variation that can be used for research or natural resource management decision-making. USGS works closely with DOI National Park Service, Fish and Wildlife Service, the USDA Agricultural Research Service, the National Ecological Observatory Network (NEON), and the US Global Change Research Program. Data on national patterns of plant and animal phenology are collected by both professionals and volunteers ("citizen scientists"); data are immediately and freely available, and have been used in a number of publications, and by state/federal land managers. Additionally, The USGS's National Water Use Information Program compiles and publishes the Nation's water-use data. Public access to some of these data is provided via the USGS Water Data for the Nation site. Water use refers to water that is used for specific purposes. Water-use data is collected by area type (State, county, watershed or aquifer) and source such as rivers or groundwater, and category such as public supply or irrigation. Water-use data has been reported every five years since 1950, for years ending in "0" and "5". The USGS works in cooperation with local, State, and Federal agencies as well as academic and private organizations to collect and report total withdrawals.

Survey response	
Which Federal agency are you responding for?	Department of Health and Human Services Substance Abuse and Mental Health Services Administration - Center for Behavioral Health Statistics and Quality
If applicable, please provide additional information about this most critical barrier.	It is hard to fill vacancies and retain appropriate staff due to inefficient HR process and inadequate position grade levels.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	Resource limitations (staffing and contractual) limit ability to support dissemination of new data set, including internal program administrative and evaluation data, as well as outside data sets and more analytic tools.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	We support a Data Portal which enables outside researchers to apply for access to restricted micro-level data which is housed on a secure virtual data enclave (hosted on a physical server). The process is extremely efficient and safe as it includes tri-factor authentication, on-site visits to users, and a rigorous application process. The Data Portal also requires all analysis to be done within the data enclave, and everything must go through a thorough disclosure review (by the appropriate data groups) before being disseminated to the researcher for use outside of the Data Portal. It has been a huge success in supporting research to researchers all over the United States, allowing access from secure locations without the inconvenience of having to travel to an on-site data center. It also is cost efficient, as all monitoring of users and researchers can be done virtually and safely. We are able to support many more researchers without having to hire additional FTEs that would otherwise have to physically be present in an RDC. We have also increased turn-around-time for allowing access to research, and providing disclosure reviews for researchers to complete papers, presentations, doctoral dissertations, and allow for our data to be utilized and analyzed to its fullest capacity. We have made access to our confidential data an easy, however very safe and compliant, and quick process for those that need it to support their research. The Data Portal has also provided easy and safe access to sister federal agencies, where before they needed to travel on site for access. This has enable other various agencies to further their

	research agendas and expedite their own timelines. Our Data Portal and over all Data Archive (SAMHDA) have revolutionized the way that we disseminate data. We now have complete ownership over our data, where it is stored, how it is accessed and the timeline in which it is deployed. We are able to turnaround data and data publications with great speed, and having control over our own systems has also enabled us to respond to requests in a much more timely manner. In working on sub committees (Confidential Data Access Committee and others) we are hopeful that with the support of other agencies, OMB will continue to work on improving the laws surrounding data collection and security - CIPSEA in particular - so that one day we will be able to support researchers using the Data Portal on a cloud environment, which would only help speed and efficiency.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Both CBHSQ and OPPI SAMHSA components have been asked to participate in this survey. We defer to OPPI to answer this question.

Survey response	
Which Federal agency are you responding for?	Department of Health and Human Services Indian Health Service
If applicable, please provide additional information about this most critical barrier.	IHS is funded at 40% of need. Other government agencies have price scales costed for agencies with deep pockets. We are primarily a health system for impoverished people. Any dollar misspent results in less medical care.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	Misclassification by race adjustment ratios using National Death Index data on a routine basis down to the service unit level Mortality linkage studies for recent years of data due to National Death Index data costs on suicide, chronic disease, injury Identification of which of our patients is a Veteran or has a service connected disability Solid maternal mortality studies Studies of patients transferred to other facilities outside IHS and outcomes
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	IHS medical records are accumulated annually, unduplicated, and put into a Indian registrant file. This is sent annually to the US Census to help them with their counts of American Indians and Alaska Natives. Census performs its linkages as needed.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Trends in Indian Health and Regional Differences in Indian Health present tables and charts that describe the IHS program and the health status of American Indians and Alaska Natives. Information pertaining to the IHS structure, American Indian and Alaska Native demography, patient care, and community health are included. Current and trend information are presented, and comparisons with other population groups are made, when appropriate. Current ones may be found at https://www.ihs.gov/dps/index.cfm/publications/

Survey response	
Which Federal agency are you responding for?	Department of Defense Army Corps of Engineers
If applicable, please provide additional information about this most critical barrier.	Information on ports is collected by the Department of Homeland Security, but either not at the level of detail that we need it, or it is and they won't provide it to us. Another issue is that individual ports do not want to share data that we could use to do economic analysis on ports, because they are concerned that 1) it would be shared with other ports, who are their competitors; and 2) we might use that data to make budget decisions favoring one ports over another based on its economic competitiveness.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	Harbor Maintenance Trust Fund report to Congress.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	1. Development of the Corps' budget is largely based on project-level data that the Corps of Engineers develops through detailed reports/studies, involving engineering, economic, environmental, and related analysis. 2. We use data on the ability of certain projects/programs to execute funds as one metric we consider in making funding decisions. We have significantly reduced funding for programs that were not capable of executing the funds they had on hand. One example is the Dam Safety Program of the Corps of Engineers - it continues to receive a high priority for funding, but it became apparent that it was not executing those funds. We used the clear signal we saw in that data to overcome internal resistance to continuing to fund a "safety" program at an overly robust level.

Survey response	
Which Federal agency are you responding for?	Department of Agriculture Food and Nutrition Service
If applicable, please provide additional information about this most critical barrier.	The requirements of the Paperwork Reduction Act were primarily designed to limit the administrative burden on entities being regulated by the government, but are applied as a government-wide gatekeeper on the nature of statistical rigor of all data collections, including one-time sampled collections. The burdens of the centralized PRA clearance process, exacerbated by the limited capacity of OIRA to address this comprehensive government-wide workload, has dramatically increased the cost and delay in getting critical information to program administrators. While the government has an interest in ensuring that data collected is valid for its purpose, high-quality, and non-duplicative, all but the most potentially-burdensome collections could be appropriately managed at the agency or sub-agency level.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	We continue to struggle with assessing the eligibility and participation of active-duty military households in our programs because of a lack of data on the circumstances of those families. Military authorities have been reluctant to share that information for reasons that are not entirely clear.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	Several studies have linked administrative and survey data to assess the effect of SNAP on food insecurity and have found a strong association between program participation and reductions in food insecurity. Census data has also been used to demonstrate the positive effects of SNAP in reducing poverty. Other studies have used both administrative and survey data to show how food insecurity affects learning and childhood development, both in the summer and during the school year. This evidence helped inform the Summer Electronic Benefits Transfer for Children (SEBTC) demonstration, which provided benefits on an electronic debit card to children eligible for free and reduced-price school meals to purchase food during the summer months when away from school.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Effectively reaching those most in need is a critical concern of the Supplemental Nutrition Assistance Program (SNAP). The Food and Nutrition Service (FNS) uses administrative data – specifically, a sample of certification data drawn annually to measure

	payment accuracy (the Quality Control, or QC, data) to examine in depth the participants it serves. The latest annual SNAP Characteristics report developed with these data shows that well over half of the benefits (58%) go to households at or below 50% of the poverty line and almost all of the benefits (93%) are going to households at or below 100% of the poverty line. Rigorous evaluations of the Summer Electronic Benefits Transfer for Children (SEBTC) demonstration, demonstration found that SEBTC reduced very-low food security among children by one-third and improved participants' diets. The study used random assignment into treatment and control groups, combined with EBT transaction data, dietary recall surveys, household interviews, and the Food Security Supplement Survey to collect data from a sample of over 50,000 children.

Survey response	
Which Federal agency are you responding for?	Department of Energy Office of Environment, Health, Safety and Security
If applicable, please provide additional information about this most critical barrier.	OMB has placed FTE limits on our organization which prevents us from hiring necessary staff.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	Historical work records are transmitted to researchers for development of Energy Employee Occupational Injury Compensation claim development for adjudication by the Department of Labor. Data is provided in a secure electronic process.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Numbers and types of injury claims are used to evaluate current health and safety policy to determine if changes are necessary.

Survey response	
Which Federal agency are you responding for?	Department of Justice Office of Justice Programs - Office of Violence Against Women
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Our office uses grantee-reported data to understand where barriers exist to serving victims of domestic and sexual violence, and to identify gaps in services. We also fund research and evaluation to assess the effectiveness and impact of interventions funded through our grant programs.

Survey response	
Which Federal agency are you responding for?	Department of Health and Human Services Centers for Disease Control and Prevention - National Center for Immunization and Respiratory Diseases
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	Any integration of data from the education sector due to FERPA
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	

Survey response	
Which Federal agency are you responding for?	Department of Veterans Affairs Veterans Health Administration
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	We transmit record-level clinical data to CMS to calculate hospital outcomes for public reporting on Hospital Compare
If applicable, please provide an example of how your office has used data to build evidence for policy making.	We have initiated a new patient survey, based, in part, on the Consumer Assessment of Health Providers and Systems (CAHPS) Clinician-Group Survey to assess the experience of Veterans who are receiving care from community (i.e., non-VA) providers under authorities established in the Veterans Choice Act of 2014. That data is identifying performance gaps that are being addressed via new processes and policies to improve Veteran experience with non-VA care.

Survey response	
Which Federal agency are you responding for?	Department of Labor Office of the Assistant Secretary for Policy - Chief Evaluation Office
If applicable, please provide additional information about this most critical barrier.	Recommend expanding access to NDNH data for research, evaluation, and statistical purposes while also providing strong privacy and confidentiality protections. Gaining access to NDNH data is very challenging. the PRA process also is very cumbersome and time consuming.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	

Survey response	
Which Federal agency are you responding for?	Department of the Treasury Internal Revenue Service - Statistics of Income Division
If applicable, please provide additional information about this most critical barrier.	Funding affects our ability to hire adequate staff to support outside researchers, develop new products on our own, explore new data sources, etc. We have been under a hiring freeze for several years and have not hired from outside our agency in at least 4. Existing staff have been frozen at relatively low journeyman pay levels due to a freeze on promotions. All this limits our ability to bring in staff with new analytical skills to help the organization embrace newer technologies and processes, including tools associated with Big Data. Budgets have been flat while expenses have increased steadily. We have had some success leveraging outside academics to help innovate. Just a few new hires would make a significant difference in our program.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	We are extremely good at linking across tax years and tax forms to create longitudinal (panel) files of tax filing populations. We successfully link millions of information documents (provided by third parties such as SSA, banks, investment companies, businesses, etc.) to tax returns. Using such linkages we produce annual tabulations of county and state-migration, support research projects including 2 looking at intergenerational income mobility, and produce income and pension fund tabulations.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	A few examples include: Chetty that has shown the importance of teacher quality in improving childhood outcomes Chetty, Manoli and others have provided valuable evidence that is being used to improve uptake of refundable credits by affected populations Mahon and Zwick have examined the effect of business stimulus programs on small businesses behavior during the recession; Hoxby has examined the uptake and estimated the effects of education tax credits Yagan has examined potential causes of individual's unwilling to relocate in the face of job loss during the recession

Survey response	
Which Federal agency are you responding for?	Department of Commerce Bureau of Economic Analysis
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	The linkage between BEA multinational firm data and Census database for foreign trade and econ census
If applicable, please provide an example of how your office has used data to build evidence for policy making.	

Survey response	
Which Federal agency are you responding for?	Department of Homeland Security Office of Policy - Office of Immigration Statistics
If applicable, please provide additional information about this most critical barrier.	Most of our resources go to meet basic reporting requirements, leaving limited time/personnel for research.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	We have developed a tool that aggregates several different DHS and DOJ data systems to analyze how aliens move through the immigration enforcement system. The tool identifies bottlenecks and shows how different populations are affected by bottlenecks and experience different types of outcomes. the tool offers insight for policy development and resource allocation.

Survey response	
Which Federal agency are you responding for?	Department of Labor Bureau of Labor Statistics
If applicable, please provide additional information about this most critical barrier.	Statutes surrounding the IRS data currently prohibit Census from sharing business data that originates from IRS filings with BEA and BLS. As a result, Census, BEA, and BLS cannot achieve the full benefits of data sharing. Specifically, Title 26, Section 6103(j) needs edited to allow for BLS access to the data to fully achieve the data sharing benefits that the Confidential Information Protection and Statistical Efficiency Act sought to achieve.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	Expanded estimates of wages by geography and industry. Expanded lay-off statistics. Firm-level statistical estimates.

If applicable, please provide additional information about this most critical barrier.	Also, lack of planning for linking by program agencies is a factor. Data do not contain identifiers to facilitate linking and and other critical data needed for high quality analysis; also SORNs often do not indicate as a routine use that data may be shared/linked/used for statistical research and evaluation purposes
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	1. Due to lack of access to USDA's Risk Management Agency Micro-level Admin data, we are unable to examine choices that farmers make between different types of insurance plans as a function of policy relevant variables such as the premium subsidy rate. 2. Do FSA programs ease credit constraints for farmers? 3. Crop insurance and Cash Receipts 4. Farm-labor studies 5. Rural manufacturing resilience 6. Impact of patents 7. Statistical analysis for SNAP and WIC would be strengthened by fuller assessment of who the programs reach, and who, among eligibles, are not reached. Identification of non-participating eligibles would be facilitated by improved access to Federal tax data (for annual income data), State UI wage records (for intra-year changes in incomes, which are volatile among the working poor), and vital records (for WIC's infant population). Moreover, access to these income- and age-eligibility data supports development of statistical control groups that, in the absence of experimental designs, provide evidence on how program participation affects program outcomes. Linking NHANES to administrative data for SNAP and WIC (and to Census survey data) would provide results on how the programs improve health and nutrition outcomes. Understanding how well the program serves important subpopulations, such as veterans or the elderly, would be improved by access to data on military service and social security data. Understanding how SNAP interacts with other programs would be promoted by easier access to data on benefits from UI, TANF and other human services programs, as well as veterans benefits.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	1. The U.S. Census Bureau, USDA's Food and Nutrition Service, which administers the Nation's food and nutrition assistance programs, and ERS formed a strategic partnership for conducting research on USDA food assistance programs. ERS and FNS seek to inform

	policymakers and others on: who participates in the programs, how program participation affects the lives of those individuals, and who does not participate and why. The Census Bureau's interests are primarily to improve their surveys, the 2020 Census, and data-linkage processes. The joint project is acquiring USDA administrative data from States and linking those data to Census Bureau surveys. Three ERS reports from the project to date have provided evidence on sub-state detail on program access, program targeting of benefits by income level, and measurement of monthly vs annual participation rates. 2. Linking Admin data to Survey data: manufacturing resilience, CRP experiments, conservation compliance
If applicable, please provide an example of how your office has used data to build evidence for policy making.	The U.S. Census Bureau, USDA's Food and Nutrition Service, which administers the Nation's food and nutrition assistance programs, and ERS formed a strategic partnership for conducting research on USDA food assistance programs using administrative data and linked data sources, obtaining results that are not obtainable using any one data source alone. The project has multiple goals. Each partner agency receives benefits, but different types of benefits support their respective missions. As USDA agencies, ERS and FNS seek to inform policymakers and others on: who participates in the programs, how program participation affects the lives of those individuals, and who does not participate and why. In contrast, the Census Bureau's interests are primarily to improve their surveys, which collect data on food assistance program participation, the 2020 Census, and data-linkage processes. The joint project is acquiring USDA administrative data from States. The project is linking those data to Census Bureau surveys, leveraging the strengths of each data source. Three ERS reports from the project to date have provided evidence on sub-state detail on program access, program targeting of benefits by income level, and measurement of monthly vs annual participation rates. FNS has a mission-driven interest in understanding how effectively SNAP is reaching the people it is designed to serve. The data required to produce detailed estimates within a State have previously not been available, and these can be helpful as States decide where to focus expenditures. The project linked SNAP data for Texas to the ACS and developed a new methodology for obtaining detailed geographic and demographic results.

	The access rate measures the share of eligible people who receive SNAP benefits. For Texas as a whole, among the people who are estimated to be eligible in the ACS, a check of the SNAP records shows that 63% of them were participants. Access rates ranges from about 37 to 77% across Texas congressional districts. The Texas report also provided access rates for selected demographic subpopulations. Incomes vary across households that participate in SNAP. What percentage of SNAP households have the "very lowest" income? Linked data help address underreporting, income variability, and complex household structures (such as multi-family households and unrelated individuals). Using linked data for New York, the study found that SNAP is targeted more towards those with low annual incomes than is detected using ACS data alone. Comparing the ACS-only measure and the measure based on linked-data found that the share of SNAP households with annual income less than 50 percent of poverty increases from about 18 to 27 percent between the two measures, while the share in poverty increases from about 51 to 61 percent. The third study address the question of who participates in SNAP. People can be eligible for SNAP, and participate in the program, in a given month. ERS called that approach a "monthly" timeframe. Alternatively, in an "annual" timeframe, people can be eligible for SNAP at some time during the year. These are two different statistical populations. Federal surveys often ask: "At some time in the last year did you receive SNAP benefits?" If an annual timeframe is used for estimating eligibles, it is important to use an annual timeframe to measure participation. New York SNAP records were used to count the number of people who received SNAP for one or more months in the annual timeframe. While the monthly participation rate for New York was about 80%, the annual rate was about 75%. The monthly slice-of-time tends to capture more people who are long-term eligibles, and they tend to participate at higher rates, boosting the monthly rate above the annual rate. Access to micro-level data and linkages across datasets enabled ERS to provide statistical analysis on three key issues of interest to policymakers involving participation in the country's largest nutrition assistance program.

Survey response	
Which Federal agency are you responding for?	Department of Health and Human Services Administration for Community Living
If applicable, please provide additional information about this most critical barrier.	The Information Collection Request process under PRA has posed a significant barrier to our office's ability to use data. Challenges include: • Process length: The length of time the process takes can exceed 12 months. The delay alone is problematic but also has a negative impact on our ability to award and manage contracts to conduct evaluations, research or measure program performance. Research and evaluation are generally conducted through independent, research firms under contract. The uncertainty and length of the ICR process leads to contract modifications, extensions and increased costs. The delays also impact the ability to collect baseline data for new programs and initiatives and for those with short life-cycles. • Challenges testing data collection instruments. Testing of data collection tools (e.g. reliability and validity) if conducted with more the 9 individuals must go through a full ICR process. This includes public comment periods for study questions and approaches that may be altered based on the testing results. While public comment on questions prior to testing may provide some useful feedback a 60 day and 30 day comment period for questions and approach that is subject to change is not an efficient approach. The process does not accommodate a rapid cycle of question testing, revision and testing. An evaluation or research study will likely undergo two ICR approvals; one for testing and the second for implementation which further delays the research. • Use and collection of Social Security Numbers (SSN) to facilitate linking across data sets: Social security numbers are the best, most reliable method for linking across data sets. Data security and privacy are always a priority when collecting PII and our office uses respected research firms with extensive experience collecting and protecting PII. We have experienced extended delays during the ICR process when data collection includes SSN for data linking purposes. The extended delays related to SSN collection have not resulted in changes or improvements in our security protocols, data collection methods or question content.
If applicable, please list up to five statistical, evaluation, research, or	Medicaid data would greatly enhance our ability to evaluate program outcomes but the timeliness,

policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	completeness, quality, and cost have led to our decision that it is not cost effective to pursue access at this time. Micro-level data from our program grantees (states and sub-state entities) has been too difficult to access. Multiple challenges impact our ability to access grantee data including: variability in grantee capacity to collect and store micro-level data; lack of data standards; and ICR/PRA requirements.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	Our office linked outcome evaluation data with Medicare beneficiary data to enable measurement of program health outcomes. Under the same project our office linked USDA, FNS Store Tracker and Redemption Systems (STARS) data to measure food access. These data linkages greatly enhance the multi-component, comprehensive process and outcome evaluation.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Our office has succeeded in working with CMS to obtain Medicare records for program evaluation purposes. Medicare beneficiary files have been used to identify a matched comparison group as well as link data for outcome analysis. The outcome evaluation is ongoing and the results will be used to inform policy and program decision-making. We have combined program process data with outcome and cost findings from CMS's Evaluation of Community-based Wellness and Prevention Programs. Results were shared with Congress and are used by program and policy decision-makers regarding evidence-based health promotion and disease prevention interventions.

If applicable, please provide additional information about this most critical barrier.	OJJDP has not received an appropriation for Part D of the JJDPA for over a decade. Consequently, all research and data collection must be funded through statutory authorities which allow us to use up to 10 percent of programmatic funding for research. This funding is extremely limited.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Most of the research, evaluation, and data OJJDP implements informs the office's policies and practice. For example, our Census of Juveniles in Residential Placement and Juvenile Residential Facility Census provide information about youth in juvenile residential facilities and the conditions of confinement including accesses to services. These data inform the office's efforts to enact juvenile justice reforms.

Survey response	
Which Federal agency are you responding for?	National Aeronautics and Space Administration
If applicable, please provide additional information about this most critical barrier.	The NASA Office of Education (OE) is currently undertaking a pilot effort to survey participants in its science, technology, engineering, and math (STEM) education programs. This effort will help NASA better gauge the outcomes of its education programs, and will enable data-driven decisions about how best to use our resources. Since we are still in the pilot stages of this effort, we cannot address all of the questions included in the survey above. Our intent is to eventually collect outcome data across all of OE's lines of business. OE receives funding of approximately $100 million each year, which is only around 0.5 percent of NASA's total budget. (Note that while NASA Education spends between 1-10 percent of its budget on evaluations, for the Agency as a whole, the spending is only a fraction of a percent.) There are resource trade-offs involved in spending our limited budget on studies to evaluate the effectiveness of our STEM education programs, rather than on the programs themselves.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	The NASA Office of Education (OE) performs a critical role in advancing the Nation's science, technology, engineering, and mathematics (STEM) education and workforce pipeline by working collaboratively with other agencies to engage students, teachers, and faculty in NASA's missions and unique assets. In recent years, OE has worked on both expanding its existing efforts and developing new capabilities to objectively determine the impact of its programs. Following are some of OE's recent and ongoing efforts to build strong, outcome-oriented performance measures: •Introducing a new annual performance indicator in FY 2017 that tracks evaluations conducted by grantees and

| | cooperative agreement awardees on educational activities; •Providing technical assistance to Center education offices and selected grantees and cooperative agreement awardees to ensure that educational investments are appropriately evaluated using common metrics and findings used to improve programmatic outcomes; and •Obtaining a generic clearance for methodological testing. This clearance is the first of its kind for NASA and allows OE to significantly enhance the quality of the its data collection instruments and overall data management through interdisciplinary scientific research, utilizing best practices in educational, psychological, and statistical measurement. |

Which Federal agency are you responding for?	Small Business Administration Office of Advocacy
If applicable, please provide additional information about this most critical barrier.	Office would like to create new data on regulatory burden and other detailed data on small business but research budget is inadequate for the scale required for this type of data collection.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	TAS, Employee Benefits and student debt as it related to entrepreneurism.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	In accordance with our statutory mission of examining the role of small business in the American economy and recommending measures for creating an environment in which all businesses have the opportunity to compete effectively, the Office of Advocacy actively supports the use of evidence based policy making. As part of achieving this mission, the Office generates original data which is used for research products and by other regulatory agencies in the crafting of policy. For one specific example, the Office of Advocacy sponsors the Census Bureau's annual Statistics of U.S. Businesses (SUSB) survey. SUSB provides comprehensive data on U.S. employer businesses by geography, industry, receipt size, employment size, and legal form of organization. Advocacy uses the SUSB data for a multitude of research projects such as our annual State Profiles. The State Profiles provide, among other information, the number of small businesses and their employment in each state by industry. Due to their comprehensive nature, the State Profiles have proven to be a key source of small business information for Congress, State policy makers and small business associations. The SUSB is also an important source of business data for regulatory agencies in the rulemaking process. For almost all rules affecting business, Agencies use the SUSB data in policy development, Regulatory Impact Analyses and for compliance with the Regulatory Flexibility Act. Data from sources such

	as the SUSB can directly alter policy decisions. For example, Advocacy engaged with DOJ Civil Rights division on a rule regarding the use of captioning and audio description devices in movie theatres. After further analysis of data from the SUSB, DOJ found their rule may not be economically feasible for many smaller movie theatres, and added an exemption for theatres using analog projection. Doing so allowed DOJ to achieve their policy objective at a smaller cost to society. Advocacy continues to use the best available data from SUSB and other sources to provide actionable research to policy makers and bolster regulatory agency's development of evidence based policy.

If applicable, please provide an example of how your office has used data to build evidence for policy making.	In our competitive grant programs, applicants for funding consideration must demonstrate how they intend to address evidence in their application and in their project should they be funded.

Survey response	
Which Federal agency are you responding for?	Social Security Administration Office of Data Exchange and Policy Publications
If applicable, please provide additional information about this most critical barrier.	The most critical barrier to data exchange is legal and disclosure limitations. SSA often does not have legal authority to disclose requested data to other agencies or researchers (universities or research organization) for the requested purpose. Statutes and systems of records notices (routine uses) generally (with certain exceptions) limit our authority to disclose SSA data to research uses that are relevant to the administration of the Social Security Act.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	My office is responsible for data exchange policy and operations at the Social Security Administration (SSA). We provide enterprise-wide, executive-level leadership, oversight, and support for SSA's data exchange programs. We work closely with SSA components (operational, research, legal, security, legislative) and external partners (federal/state agencies, private entities, universities and other research organizations) to develop and implement data exchange agreements for both programmatic and research purposes. On the research side, we seek to obtain data needed by SSA components to conduct research and statistical activities and to provide SSA data to others for research and statistical purposes.

If applicable, please provide an example of how your office has used data to build evidence for policy making.	We use demographic and skills information for placement. We use workforce information to determine skills gaps. We use workforce information to project funding needs.

Survey response	
Which Federal agency are you responding for?	Department of Transportation Federal Motor Carrier Safety Administration
If applicable, please provide additional information about this most critical barrier.	The challenge is that there are numerous legacy IT systems that have valuable information and those systems were not set up to support comprehensive data analyses and queries. And we have difficulties getting information out of these legacy Federal and State systems. As we develop the IT systems to support new programs we apply the lessons learned to ensure those systems are structured in such a way that we can perform a wide range of analyses.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	1. Determining the number of active commercial driver's license (CDL) holders in the U.S.; 2. Determining the number of new CDL holders entering the trucking and motorcoach industry each year; 3. Determining the number of Class A versus Class B CDL holders for #1 and #2 above; 4. Determining the average amount of behind the wheel training that CDL applicants receive when they attend the established training schools. This information was needed to help with the analyses to support my agency's entry-level driver training rulemaking - a statutorily mandated rulemaking. We completed the rulemaking through the negotiated rulemaking process so we were able to achieve a consensus among stakeholders about the content of the rule, but we were not able to come up with solid information from our own data or the data the State driver licensing agencies maintain.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	An example of a micro-level data project that has worked well for my office is our new National Registry of Certified Medical Examiners Program. Through this program we established minimum training and testing requirements for all State-licensed healthcare providers that perform the DOT medical exam for interstate truck and bus drivers. Each of the more than 52,000 examiners must submit monthly reports to the agency identifying each person who is examined and the results of the examination (e.g., pass or fail, and the length of the medical certification (with a maximum length of 2 years). The system has enabled us to determine the number of active truck and bus drivers and provided information on the percentage of drivers with health issues that preclude the issuance of a 2-year medical card. The system has also provided alarming

	information about the number of drivers who were medically disqualified. We can also conduct analyses to identify medical examiners who conduct an unusually large number of examinations and compare the performance of the various types of healthcare providers, as well as geographic variations by examiners and State of registration of the drivers.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	One of the more recent examples involved policy making concerning the operation of 9-to-15 passenger vehicles in interstate commerce. The agency was faced with a statutory mandate to impose safety regulations on 9-to-15 passenger vehicles operated for direct compensation in interstate commerce, but we were given discretion to focus on a subset that we determine pose the greatest risk. To assess the risks, my agency reviewed data from the National Highway Traffic Safety Administration's Fatality Analysis Reporting Systems (FARS). FARS data was of sufficient detail to enable us to identify the number of fatal crashes involving these small passenger-carrying vehicles, the number of crashes that happened while the vehicle was actually transporting between 9 and 15 individuals, the location of the crash (State and zip code), the state of registration for the vehicle and the state of licensure of the driver along with the zip code for the driver's residence. Using certain assumptions (e.g., Federal Highway Administration survey results on the average distance individuals commute to work), we were able to make the argument that operations that involved distances of more than 75 air-miles represent the greatest safety risk. We subsequently decided to move forward with the rulemaking focused on 9-to-15 passenger operations traveling more than 75 air-miles to address the safety challenge while minimizing to the greatest extent the regulatory burden on short-distance operations of these vehicles. Although this regulatory approach appeared to satisfy most stakeholders, certain parties lobbied Congress to enact legislation several years later to force the agency to impose the rules on all the 9-to-15 passenger vehicles operated for direct compensation, irrespective of the data analysis and evidence.

Which Federal agency are you responding for?	Department of Health and Human Services Centers for Medicare and Medicaid Services - Office of Enterprise Data and Analytics
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	CMS creates administrative Medicare claims data through the operation of the Medicare fee-for-service program. OEDA has used this data to develop public use files that present information on Medicare billing practices at the provider-level. For example, data released on skilled nursing facilities includes information on whether facilities are providing just enough therapy minutes to qualify for a higher payment (number of therapy minutes is 10 minutes or fewer above the payment threshold). This data can be used to identify facilities that are outliers in their billing practices or analyzed to determine if a policy change is needed to address this activity.

Which Federal agency are you responding for?	Department of Energy Energy Information Administration
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Oil Export Policy: During 2014 and 2015 both Congress and the Administration used EIA data on domestic oil production, oil imports, and refinery inputs to assess the implications relaxing restrictions on exports of domestically-produced crude oil. Using both its data and modeling capabilities, EIA provided data and analytic reports that showed how different policy choices might affect gasoline and crude oil prices, the level of domestic crude oil production, domestic refiners, and trade in petroleum products. EIA's residential Energy Consumption Survey (RECS) is used by several DOE offices and other government agencies. A few examples are: • the U.S. Department of Health and Human Services, Administration for Children and Families (HHS/ACF) to support evaluations of the LIHEAP program, which distributes energy assistance to more than 8 million low-income households annually to defray home heating and cooling costs. • The Department of Energy, Office of Energy Efficiency and Renewable Energy (EERE) uses to support the Appliances and Commercial Equipment Standards Program to determine the adequacy of the payback period for consumer of efficiency improvements. • U.S. Bureau of Labor Statistics (BLS) uses RECS data microdata file in the preparation of the Consumer Price Index (CPI). In particular, RECS microdata are the principal source for estimating utility costs for renters whose utility costs are included in their rent, which represents 20 percent of the renter sample used in the CPI. As a result, BLS does not have to field

| | an additional survey to account for these utility costs. The CPI is, of course, is the principal indicator of the U.S. for understanding changes in cost living. |

Survey response	
Which Federal agency are you responding for?	Department of Housing and Urban Development Policy Development and Research
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	We complete our activities. However, it takes way too long to find champions and executive support in other agencies, and the process to access some of the key data sources is way too bureaucratic. We/our representatives link to ACS, AHS, NDNH, NHIS/NHANES, IRS, FAFSA, VA, etc.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	We/our representatives link to ACS, AHS, NDNH, NHIS/NHANES, IRS, FAFSA, VA, etc. Some of our most successful data linkage projects have been with organizations with a RDCs already in place.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	The Family Options demonstration tested 4 policy options for assisting homeless families, using random assignment of over 2000 families in a dozen sites ranging from Boston to Honolulu: Housing Choice Vouchers, Project-Based Transitional Housing, Rapid Rehousing, and Usual Care (usually paid from non-Federal sources). Vouchers had substantial quantifiable benefits relative to the other interventions, and Rapid Rehousing had the lowest quantifiable cost to society. From the perspective of ending family homelessness in the US, Project-Based Transitional Housing appears to have very little to offer, and the Office of Community Planning and Development at HUD has issued guidance tending to reduce the use of PBTH with Federal funds. HUD annually allocates between $1 and $2 billion a year for the administration of Housing Choice Vouchers, but the allocation system had never been based on evidence, and the line item could not be justified to appropriators in the absence of evidence. The HCV Administrative Cost Study produced a finely calibrated allocation formula based on a time and motion study at 60 high-performing PHAs throughout the US. The Office of Public and Indian Housing at HUD has used the study to move the HCV program to a new administrative fee system. HUD currently is running large-scale randomized experiments to determine: A. The efficacy of Housing Counseling for prospective first-time homebuyers B. The effects of the Family Self-Sufficiency program, especially in

	increasing employment and earnings among HCV families C. The effects of Rent Reform in the voucher program, especially on employment and termination of assistance HUD is also conducting paired comparison evaluations: 1. Rental Assistance Demonstration, in which 24 public housing projects undergoing conversion to a private-owner assisted model are compared with 48 similar projects not undergoing conversion 2. Small Area Fair Market Rents, examining the experience of 5 PHAs selected by lottery from a cluster of similar PHAs, where voucher subsidies are set at the zip code level rather than the metropolitan level to encourage deconcentration.

Survey response	
Which Federal agency are you responding for?	Department of Health and Human Services National Institutes of Health – NIH Office of Science Policy
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	1. Economic analyses of substance use disorder treatment; long term outcomes of addiction treatment. 2. accurate analysis of the greater research landscape, such as international research or biomedical industry research 3. Assessing the degree of NIH's contributions to FDA new drug approvals in a comprehensive way. This work has been hampered by lack of open-source, standardized FDA data on the research evidence cited in FDA new drug applications, including the specific clinical trials considered in the application, as well as the limitations of search and export capabilities within FDA's publicly accessible databases (e.g., Drugs@FDA). 4. Linking data on NIH-funded research to health interventions to healthcare utilization data. This is a complex undertaking that would require linking high-quality structured data from NIH and several other Operating Divisions of HHS. While not the most limiting factor, the cost of access to CMS utilization data within their research data center is an added barrier.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	1. Portfolio analysis informed expert panels on current funding and research gaps. Challenge competition for Audacious Goals identified stakeholder priorities for initiative planning. 2. Using NSDUH, MTF, and CDC Wonder data to present the scope of substance use disorder and overdose in the US 3. Administrative data was used to make a policy/program decision and create the Trailblazer R21 Program, a new research grant program focused on early career investigators that makes use of the Exploratory/Developmental R21 grant mechanism. This program emphasizes that no preliminary data is needed in grant applications and gives priority to early career investigators. Anecdotal information, which was later confirmed through administrative data analysis, indicated that high quality applications were not being funded, with reviewers commenting that they wanted preliminary data;

thus senior investigators were beating out early career investigators as competition for funding, in general, increased. R21 grants were not being used for the purpose that they were meant to be, and instead were being used to fund more traditional research. As a result of this analysis, a portion of R21 funds was set aside for the new Trailblazer R21 program. 4. Additionally, the NIH Office of Science Policy compiled several examples of NIH program evaluations and other analyses performed which utilized administrative and other statistical data: Assessing Research Training and Workforce Needs/Outcomes • Race, Ethnicity, and NIH research awards. Ginther et al. Science 333(6045):1015-9 2011. An analysis of NIH grant funding and peer review outcomes that finds several disparities in the process related to investigators' race and/or ethnicity. Although proposals with strong priority scores were equally likely to be funded regardless of race, the authors find that Asians are 4 percentage points and black or African-American applicants are 13 percentage points less likely to receive NIH investigator-initiated research funding compared with whites. The group conducted a follow up study investigating the intersection of gender and race/ethnicity, Gender, Race/Ethnicity, and National Institutes of Health R01 Research Awards: Is There Evidence of a Double Bind for Women of Color? Ginther et al. Acad. Med. 91(8):1098-107 2016. The study found that white women PhDs and MDs were as likely as white men to receive an R01 award, and that compared with white women, Asian and black women PhDs and black women MDs were significantly less likely to receive funding. • Biomedical Workforce Working Group Report. NIH Advisory Committee to the Director, 2012. A working group of the NIH Advisory Committee to the Director was tasked with developing a model for a sustainable and diverse U.S. biomedical research workforce that could inform decisions about training the optimal number of people for the appropriate types of positions to advance science and promote health. • Outcome Evaluation of the NCI Career Development (K) Awards Program. Discovery Logic, 2012. An evaluation of the outcomes of a set of career development awards for the National Cancer Institute. • Evaluation: National Institutes of Health Individual Mentored Career Development Awards Program. Discovery Logic, 2011. An evaluation of outcomes from a particular set of individual mentored awards sponsored by NIH's Office of Extramural Research. Assessing Research

Program Outcomes and Scientific Productivity • Predicting Productivity Returns on Investment: Thirty Years of Peer Review, Grant Funding, and Publication of Highly Cited Papers at the National Heart, Lung, and Blood Institute. Lauer et al. Circulation Research 117(3) 2015 An analysis of whether peer review percentile rankings predict grant productivity, as measured through publications and citations, based on 6873 cardiovascular R01 grants funded by the National Heart Lung and Blood Institute in 1980-2011. The authors find a modest association, but poor discrimination, and a variety of mixed results. • Association of percentile ranking with citation impact and productivity in a large cohort of de novo NIMH-funded R01 grants. Doyle et al. Molecular Psychiatry 20(9) 2015. This study analyzed the citation impact and productivity for 1755 de novo investigator-initiated R01 grants funded for at least 2 years by National Institute of Mental Health between 2000 and 2009. The authors found no association between grant percentile ranking and subsequent productivity and citation impact, even after accounting for subject categories, years of publication, duration and amounts of funding, as well as a number of investigator-specific measures. • Research funding. Big names or big ideas: do peer-review panels select the best science proposals? Li et al. Science 348(6233):434-8 2015. This paper examines the success of peer-review panels in predicting the future quality of proposed research. The authors construct new data to track publication, citation, and patenting outcomes associated with more than 130,000 research project (R01) grants funded by the U.S. National Institutes of Health from 1980 to 2008. The authors find that better peer-review scores are consistently associated with better research outcomes and that this relationship persists even when we include detailed controls for an investigator's publication history, grant history, institutional affiliations, career stage, and degree types. • Percentile Ranking and Citation Impact of a Large Cohort of National Heart, Lung, and Blood Institute–Funded Cardiovascular R01 Grants. Danthi et al. Circulation Research 114:600-606 2014. This study conducted an observational analysis of percentile rankings and bibliometric outcomes for a contemporary set of funded NHLBI cardiovascular R01 grants. The study identified 1492 investigator-initiated de novo R01 grant applications that were funded between 2001 and 2008 and followed their progress for linked publications and citations to those publications. • An Outcome Evaluation of the National

Institutes of Health (NIH) Director's Pioneer Award (NDPA) Program, FY 2004–2006 Institute for Defense Analyses -Science and Technology Policy Institute, 2013. Sponsored by the NIH Division of Program Coordination, Planning, and Strategic Initiatives, this outcome evaluation assessed a targeted high-risk, high-reward research program, based on comparing NIH Pioneer Award recipients with recipients of more standard NIH R01 research grants as well as awardees of the Howard Hughes Medical Institute (HHMI). The evaluation addresses several questions: To what extent does the research supported by the program produce unusually high impact, and to what extent are the research approaches used by the grantees highly innovative? The evaluation also addressed two secondary questions: To what extent is the Pioneers' research interdisciplinary, and to what extent are the Pioneers collaborative? • Automated Research Impact Assessment: a new bibliometrics approach. Drew et al. Scientometrics 106(3) 2016. The National Institute of Environmental Health Sciences (NIEHS) has developed a new method to quantify the impact of funded research on the scientific and broader communities. In this article they describe a new bibliometric analysis method, the Automated Research Impact Assessment (ARIA). ARIA taps into a resource that has only rarely been used for bibliometric analyses: references cited in "important" research artifacts, such as policies, regulations, clinical guidelines, and expert panel reports. The approach includes new statistics that science managers can use to benchmark contributions to research by funding source. • Greatest 'HITS': A new tool for tracking impacts at the National Institute of Environmental Health Sciences. Drew et al. Research Evaluation 22(5) 2013. This article presents the High Impacts Tracking System (HITS), a new approach to documenting research impacts that is in development at the National Institute of Environmental Health Sciences (NIEHS). HITS is designed to help identify scientific advances in the NIEHS research portfolio as they emerge, and provide a robust data structure to capture those advances. The authors have downloaded previously un-searchable data from the central NIH grants database and developed a robust coding schema to help track research products (going beyond publication counts to the content of publications) as well as research impacts. They describe the coding schema and key system features as well as several development challenges, including data integration,

	development of a final data structure from three separate ontologies, and ways to develop consensus about codes among program staff. • Toward the assessment of scientific and public health impacts of the National Institute of Environmental Health Sciences Extramural Asthma Research Program Using Available Data. Liebow et al. Environ. Health Perspectives. July 2009. The National Institute of Environmental Health Sciences (NIEHS) Division of Extramural Research and Training developed a framework to measure the scientific and health impacts of its extramural asthma research to improve the scientific basis for reducing the health effects of asthma. They then apply the framework to characterize the NIEHS asthma portfolio's impact in terms of publications, clinical applications of findings, community interventions, and technology developments. • Scientific and Public Health Impacts of the NIEHS Extramural Asthma Research Program - Insights from Primary Data. Orians et al. Res Eval. 2009 Dec;18(5):375-385. NIEHS is the third largest source of asthma related research grant funding within the NIH between 1975-2005. Research results are often published in clinically-focused journals and these results are more likely to have an impact on clinical practice. While links to numerical public health outcomes are not discussed, this paper does link NIEHS funding to key breakthroughs related to asthma susceptibility and symptoms, showing NIEHS' role in publications, clinical trials, and the adoption and dissemination of particular asthma interventions.

Which Federal agency are you responding for?	National Science Foundation Office of Integrative Activities
If applicable, please provide additional information about this most critical barrier.	The lack of standard procedures or guidelines for sharing data across Federal agencies that fund research makes efforts to link and share data difficult or inefficient.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	Linking NSF awards data with patent data from USPTO allows NSF to identify links between investments in basic research and patents, which are useful in determining the potential impact of research investments on technology and the economy.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Text analyses of NSF awards have revealed patterns about how NSF's second merit review criterion — Broader Impacts — is currently addressed by Principal Investigators (PIs) in proposals submitted to NSF and by reviewers in their reviews. The findings from these patterns will be used to design policies and provide guidance to PIs and reviewers on how to better address broader impacts of the proposed research. Analyses of proposals to the INCLUDES program that were funded and declined will allow program officers to revise solicitations to better align proposal with program objectives.

Which Federal agency are you responding for?	Department of Labor Office of Workers' Compensation Programs
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	OWCP uses data analysis to support ongoing operations, evaluation, program integrity and accountability, and analysis for policy and decision-making. The majority of OWCP's data sets are "confidential data" (per the survey definitions) which contain PII about claimants as well as, in some cases, personal medical information related to their claims. The "individual unit" (per the survey definition) for most OWCP data sets is the claimant. For some OWCP programs, intermediate source data is provided by another agency, such as the Social Security Administration data to confirm employment and earnings, and to support offset requirements. Data analysis for ongoing operations include compilation and statistical analysis for recurring (monthly and quarterly) operational reviews as assessment of progress and results related to OWCP's five-year strategic plan. In FY 2016, OWCP completed development of the OWCP Unified Reporting System (OURS) to which the four programs push selected data on a weekly basis. OURS compiles the data and provides standardized reports available to managers and executives for quarterly reviews as well as on-demand performance analysis. OWCP has conducted a number of analyses using confidential data for decisions about proposed policies. The approach for these analyses varied depending on the policy issue, including examining claims for patterns across claimants or healthcare provider populations, in home health care usage, in wage loss compensation or

	medical benefit payments, and claims processing across OWCP offices. OWCP is currently conducting a statistical staffing analysis, using intermediate source (DOL Human Resource Center) data. This analysis will be used as input for human capital planning in the next OWCP strategic plan

If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	I am using this space to explain the difficulty I had in completing this survey. The Office of Head Start (OHS) directly funds over 1,600 grantees to operate Head Start, Early Head Start and Early Head Start - Child Care Partnerships. The annual budget is approximately 9 billion dollars. The Head Start Act, as amended, requires the Secretary to reserve no more than 20 million dollars to fund research, annually. The Office of Program, Research and Evaluation, which resides in our Agency - the Administration for Children and Families, is responsible for research projects for the OHS and the expenditure of the 20 million dollars annually. I do not know, if they were asked to complete this survey; however, the questions may have been more applicable to their work than that of the OHS, which is overwhelmingly focused on program operations and oversight. Because OHS is a federal to locally funded program, the data we collect on individual grantees is generally related to day to day operations and grant making. Although our national funded enrollment is nearly a billion children, we do not collect child or family level data. That data resides in the grantee files and OHS recently promulgated news regulations to safeguard against unauthorized sharing or use of PII. Annually each grantee must complete a Program Information Report (PIR), which is available to the public, and does provide grantee aggregate data, which we do use in identifying trends and progress across

| | states and regions and the PIR data is also used by independent researchers. Our major focus is to ensure whatever we collect is not collected by another federal agency and if another federal agency or state agency has data that we can leverage to do our job better than we want to be able to access that data readily. Clearly, there have been many challenges in these areas and dedicating a sufficient amount of our own resources in this area is a part of the challenge. |

Survey response	
Which Federal agency are you responding for?	Millennium Challenge Corporation
If applicable, please provide additional information about this most critical barrier.	MCC, and particularly its General Counsel, are seriously concerned about the limited legal assurance we can provide to partner countries, IRBs and survey respondents regarding FOIA requests for micro-level data that may be indirectly identifiable. For the purposes of scientific integrity and advancement, we value the ability of independent, responsible researchers to be able to replicate, re-analyze, or test new analytic hypotheses using our evaluation data. But uncertainty surrounding FOIA exemption rulings limits MCC's ability to ensure respondents and their governments that potentially identifiable micro-data shall only be used for statistical purposes.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	MCC is unable to archive and make available restricted access versions of individual and establishment tax payer confidential interview data. On two occasions, IRBs have cited FOIA risks in refusing to allow MCC's independent evaluators to submit analytically useful micro-data to MCC for archival and restricted access dissemination.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	Public water and electric power utilities have worked with MCC hired evaluators to identify lists of households eligible for subsidized connections to utilities. These have worked successfully in Tanzania (water and power), El Salvador (power), Mozambique (water), and Jordan (water).
If applicable, please provide an example of how your office has used data to build evidence for policy making.	MCC's sectoral reviews of evaluations in agriculture and transportation have contributed to substantial changes in the ex-ante evidence requirements for MCC investments in those sectors. Additional sector-specific review work is currently underway in other sectors as well.

Survey response	
Which Federal agency are you responding for?	Department of Education National Center for Special Education Research
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	It is very difficult to find out what happens with students with disabilities after they transition from high school. Are they able to find jobs that provide an adequate income, and do they stay in those jobs over time? How do students with disabilities fare in postsecondary schools? Do students with disabilities receive SSI, and if so, are there certain transition experiences that make it less likely for them to rely on this program? Using data to follow students with disabilities over time would help improve programs and policies aimed at students with disabilities in high school.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	The increased demand for accountability in education focused on improved student academic performance has led to many questions about the most accurate method for capturing individual student progress, particularly for students with disabilities. Although there is a substantial amount of existing research on the characteristics of students with disabilities and assessment of their abilities and skills for purposes of classification and intervention, far less is known about the natural developmental progress in achievement for students with disabilities. The National Center for Special Education Research funded an initiative to study academic growth trajectories of students with disabilities and develop and test practical and relevant methods of accurately measuring academic growth for students with disabilities for use in accountability systems. The ultimate objective of the Center is to develop assessment methods that schools can use to (1) accurately assess the academic progress of students with disabilities and (2) improve the quality of education provided to students with disabilities, leading to improved student outcomes. Data from three States are used in this work.

Survey response	
Which Federal agency are you responding for?	Department of Labor Employment and Training Administration
If applicable, please provide additional information about this most critical barrier.	
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	We are in process of implementing common performance and reporting data for grantees, across Federally funding programs, where data submitted to the Federal level does not contain confidential information, but for which one unit (or individual) can be identified in multiple programs. Still significant work ahead.
If applicable, please provide an example of how your office has used data to build evidence for policy making.	Conduct pilots and evaluations, build capacity of grantees to conduct their own research and evaluation, use of performance accountability measures, use of data analytics, etc. This information is used in policy development, as part of the development of budget requests, to identify strong performing grantees to help identify promising practices, to inform our operating plan, etc.

Survey response	
Which Federal agency are you responding for?	General Services Administration
If applicable, please provide additional information about this most critical barrier.	Finding Agency point person to coordinate on data sharing agreements, and put in substantial leg work to troubleshoot and execute and get senior level support is very challenging.
If applicable, please list up to five statistical, evaluation, research, or policy analysis activities your office, or its representatives, have not been able to complete because it was too hard to access the right data.	We have not been able to look at program impact on ultimate health, wellbeing, employment, income, etc outcomes, but rather been restricted to intermediary operational outcomes that the lead Agency office owns and manages.
If applicable, please provide an example of a micro-level data linkage project or process in your office that works well.	
If applicable, please provide an example of how your office has used data to build evidence for policy making.	The Federal government has incredibly rich data sources that, if used carefully and appropriately, can help answer many pressing questions regarding program impact, program efficiency, and help build needed evidence bases. Unfortunately, our ability to answer these questions is largely restricted to agencies, offices and teams who have knowledge, bandwidth, patience and willingness to tackle complex data sharing agreements and protocols. Further, many agencies may want to understand their programs impact on health, income, employment, or educational outcomes that are collected outside their agencies. The difficulty in tackling data sharing largely means that evaluation outcomes, specifically which the GSA Office of Evaluation Sciences, conducts are restricted to intermediary outcomes.

Appendix F: CEP Public Meeting Materials and Presentations

Between July 2016 and March 2017, the Commission convened seven public meetings, with a total of 49 invited witnesses.

Appendix F includes each of the witnesses' presentations or written statements.

July 22, 2016 Meeting

Commission on Evidence-Based Policymaking

Statement

July 22, 2016   Contact: adrm.commission.liaison.team@census.gov

Joint Statement from Chair Katharine G. Abraham and Co-Chair Ron Haskins on the Commencement of the Commission on Evidence-based Policymaking

The Commission on Evidence-Based Policymaking begins its work in the midst of an unprecedented movement toward evidence-based policymaking. This movement has been growing for more than a decade at the federal and state levels, and reflects a continued desire from the American public and policymakers that credible information be available to inform decisions about government programs and activities. Congress and the President created this bipartisan Commission to provide the nation with guidance on ways to further expand our approaches to evidence-building in government. We recognize that we have been given an enormous opportunity to help the country move towards better and more effective government in the coming decades, and look forward to developing a bipartisan strategy to ensure that evidence increasingly informs the important decisions that affect the lives of Americans.

Census-FNS-ERS
Next-Generation Data Platform
for USDA food assistance program research

United States Department of Agriculture

Mary E. Bohman, Ph.D.
Administrator

Evidence-Based Policymaking Commission
July 22, 2015

Economic Research Service

Census-FNS-ERS Project Goals

- **ERS and FNS**: to inform policymakers, program managers, and the public on:
  - who participates in USDA food assistance programs
  - how program participation affects the lives of those individuals
  - and who does not participate and why
- **Census**: to inform decisions on surveys, the 2020 Census, and data-linkage processes

Economic Research Service

7/22/2016

Census-FNS-ERS Project Activities

- Acquiring USDA administrative data from States

    --data are collected and reside at the State-level

- Linking administrative data to Census surveys

    --linking leverages the strengths of each data source

- Conducting analysis

    --gain results unobtainable by either one separately

USDA Economic Research Service

Strengths and Limitations of Data Sources

State SNAP records

- **Strengths**
  - ➤ complete—all participants
  - ➤ reliable detail on SNAP duration and benefits each month
  - ➤ "available"
- **Limitations**
  - ➤ exclude non-participants
  - ➤ include only set of variables needed to operate program
  - ➤ omit data on food security, health, other outcomes

Survey data

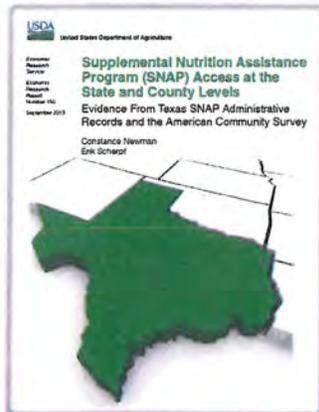
- **Strengths**
  - ➤ include participants and non-participants
  - ➤ include a rich set of socio-economic data
  - ➤ include outcomes
- **Limitations**
  - ➤ households underreport SNAP participation and benefits
  - ➤ may lack any information on SNAP duration and benefits

USDA Economic Research Service

7/22/2016

Report 1. SNAP Access Rate

Supplemental Nutrition Assistance Program (SNAP) Access at the State and County Levels
Evidence From Texas SNAP Administrative Records and the American Community Survey

Constance Newman
Erik Scherpf


- **Issue: Who does SNAP reach—and not reach—at the sub-State level?**
- Linking SNAP data and American Community Survey gives detailed geographic and demographic results
- Access rate = share of people estimated to be eligible who receive SNAP benefits

USDA Economic Research Service

SNAP Access Rates: Geographic
(2009 ACS linked to 2008-09 SNAP data)

- Texas: 63%
- Among congressional districts: 37% to 77%
- Among 25 "large" counties: 46% to 78%

SNAP Access by Texas Congressional Districts, 2008-2009
- 36.8% – 55.8%
- 55.9% – 59.8%
- 59.9% – 70.4%
- 70.5% – 76.9%

USDA Economic Research Service

7/22/2016

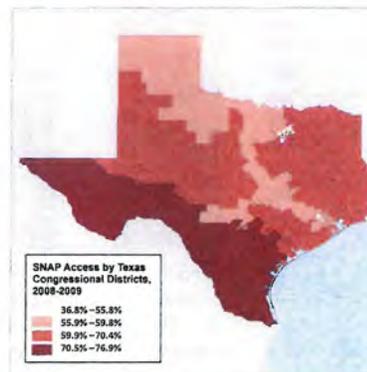
Report 2. SNAP Targeting

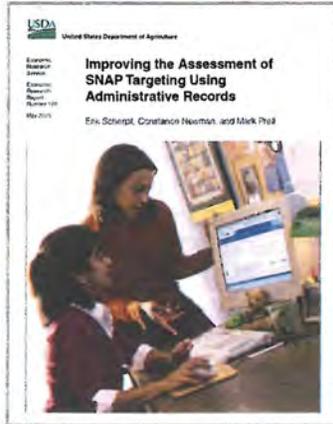
USDA United States Department of Agriculture

Economic Research Service

Improving the Assessment of SNAP Targeting Using Administrative Records

Erik Scherpf, Constance Newman, and Mark Prell

May 2015




- Issue: What percentage of SNAP households have the "very lowest" income?
- Data linking provides official record of SNAP participation and data on annual income.

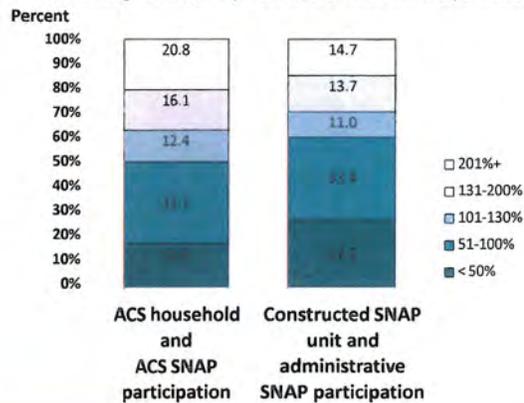
USDA **Economic Research Service**

Distribution of Income Relative to Poverty, SNAP "Households"

2008 through 2012 ACS 1-year data, New York State respondents

Percent

	ACS household and ACS SNAP participation	Constructed SNAP unit and administrative SNAP participation
20.8		
16.1		
12.4		
14.7		
13.7		
11.0		

- 201%+
- 131-200%
- 101-130%
- 51-100%
- < 50%


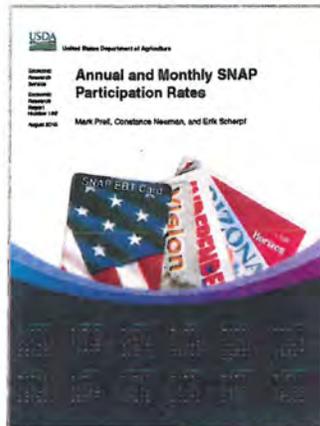
USDA **Economic Research Service**

7/22/2016

Report 3. Annual vs. Monthly Participation Rates

United States Department of Agriculture

Annual and Monthly SNAP Participation Rates

Mark Prell, Constance Newman, and Erik Scherpf


- Issue: Who participates in SNAP among two "statistical" populations of eligibles?

- People can be eligible (and participate) in:

  - Monthly timeframe: a given month (a "moment" in time)

  - Annual timeframe: one or more months of a year ("at some time during the year")

- Federal surveys often ask: "At some time in the last year ...?"

USDA Economic Research Service

9

New York Results
(based on New York SNAP data, CPS and SIPP, 2012)

- Monthly Rate > Annual Rate

  - Monthly SNAP participation rate of 80%

  - Annual SNAP participation rate of 75%

USDA Economic Research Service

10

7/22/2016

Three Lessons for Success

- **Partnership**—not all elements of support (programmatic, infrastructure, and analytical) may come from a single agency

- **Mutual benefits**—but often different benefits for the different agencies

- **Valued results**—policymakers, program managers & other stakeholders deem project worthy of support, necessary for resources to support the work

USDA Economic Research Service

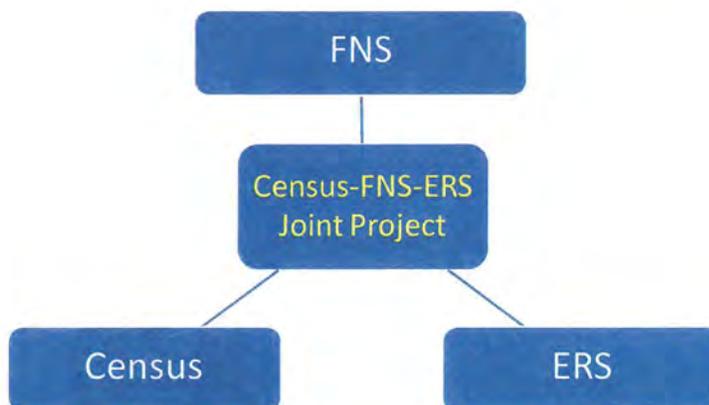
11

A Three-Way Partnership

FNS

Census-FNS-ERS Joint Project

Census

ERS


USDA Economic Research Service

12

7/22/2016

Partners Contribute Specialized Expertise and Resources

- **FNS programmatic support:**
  - ➢ meets statutory use restriction for administrative or enforcement purpose
  - ➢ knows SNAP's issues
  - ➢ facilitates acquiring SNAP data from States
- **Census "infrastructure" support:**
  - ➢ IT and acquiring, cleaning, linking data
  - ➢ policies & procedures for handling data (maximize use while protecting confidentiality and integrity)
  - ➢ Accessing Census data requires research to provide a Census benefit and researcher obtains Special Sworn Status as a Census agent.

USDA **Economic Research Service**

13

Partners Contribute Specialized Expertise and Resources (continued)

- **ERS analytical and financial support:**
  - ➢ economics, statistics and econometric modeling
  - ➢ identifies policy and economic issues with FNS and Census
- **State SNAP agencies are key partners too:**
  - ➢ State-specific expertise in SNAP files
  - ➢ quid-pro-quo recipients of statistical results
- **Other partners:** OMB, OGCs, and political leadership

USDA **Economic Research Service**

14

7/22/2016

SNAP Agreements at Census: A process to reach final signature

In Draft Review
Ready for Signing
Signed
(as of July 7, 2016)

USDA Economic Research Service

Next Steps

- More States, more programs
- Nutrition and food security research
- Expanding "data" access
  - ➢ confidential SNAP data as "data": external researcher access via Federal Statistical Research Data Centers
  - ➢ statistical aggregates as "data": Census developing data visualization (Tableau)

USDA Economic Research Service

Improving Economic Opportunity in America
New Lessons from Administrative Data

Raj Chetty

Stanford University

The American Dream?

- Probability that a child born to parents in the bottom fifth of the income distribution reaches the top fifth:

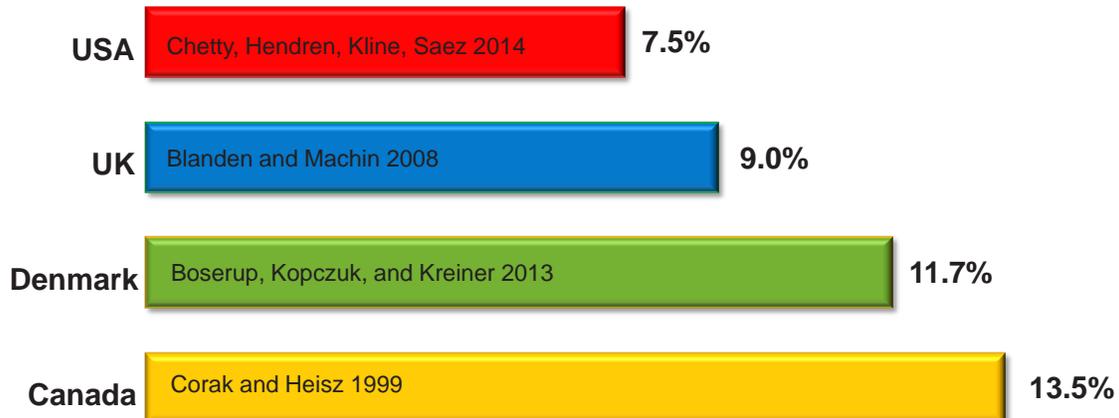
The American Dream?

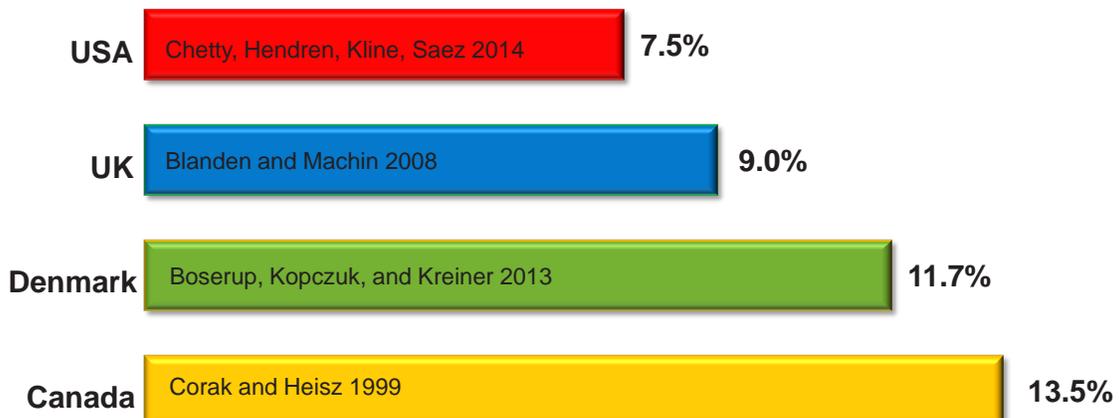
- Probability that a child born to parents in the bottom fifth of the income distribution reaches the top fifth:

USA	Chetty, Hendren, Kline, Saez 2014	**7.5%**
UK	Blanden and Machin 2008	**9.0%**
Denmark	Boserup, Kopczuk, and Kreiner 2013	**11.7%**
Canada	Corak and Heisz 1999	**13.5%**

The American Dream?

- Probability that a child born to parents in the bottom fifth of the income distribution reaches the top fifth:

USA	Chetty, Hendren, Kline, Saez 2014	**7.5%**
UK	Blanden and Machin 2008	**9.0%**
Denmark	Boserup, Kopczuk, and Kreiner 2013	**11.7%**
Canada	Corak and Heisz 1999	**13.5%**




→ Chances of achieving the "American Dream" are almost two times higher in Canada than in the U.S.

Differences in Opportunity Within the United States

- Differences across countries have been the focus of policy discussion

- But upward mobility varies even more *within* the U.S.

- We calculate upward mobility for every metro and rural area in the U.S.

  - Use de-identified data from IRS tax records (part of a broader project on effects of tax expenditures)

  - 10 million children born between 1980-1982

Montgomery County ($40,000)

Washington DC ($30,000)

Age of Child when Parents Move (x-axis: 10 to 30)

What are the Characteristics of High-Mobility Areas? Five Strongest Correlates of Upward Mobility

1. Less residential segregation

2. Larger middle class

3. More stable family structure

4. Greater social capital

5. Better school quality

Housing Vouchers and the Moving to Opportunity Experiment

- Results suggest that giving low-income families housing vouchers to move to better areas canimprove outcomes

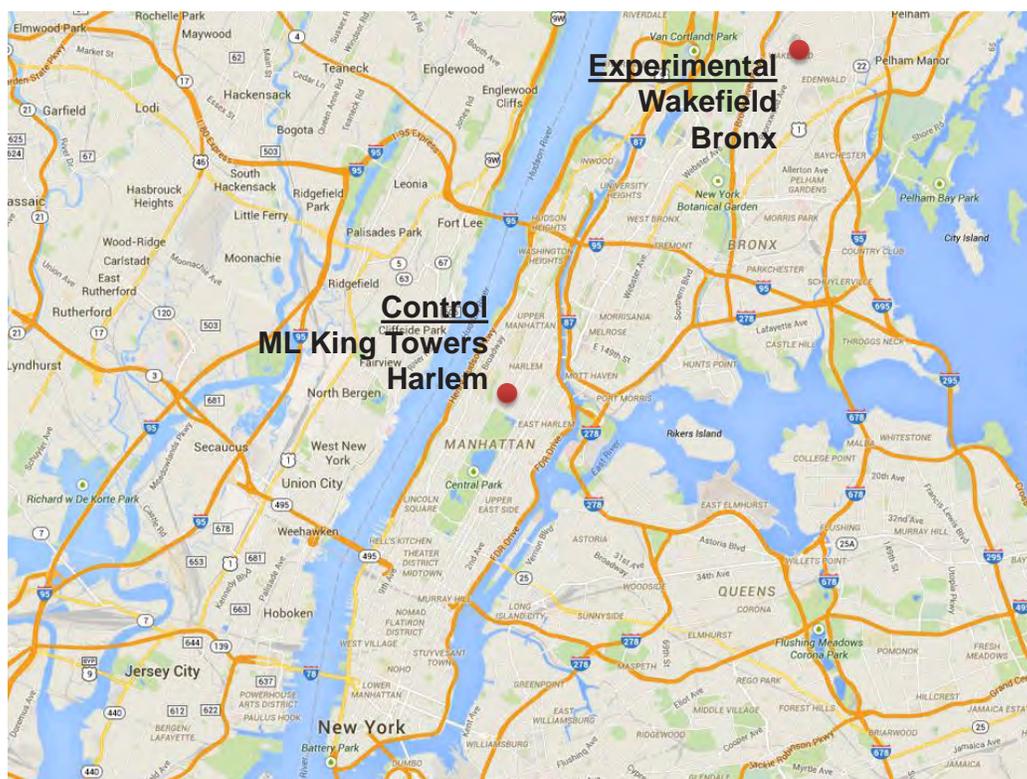
- HUD Moving to Opportunity Experiment: gave vouchers to move to low-poverty areas using a randomized lottery

  - 4,600 families in Boston, New York, LA, Chicago, and Baltimore in mid 1990's

  - Prior work found little impact of MTO on economic outcomes

  - We linked MTO data to tax records to track long-term impacts on children who moved at younger ages

Source: Chetty, Hendren, and Katz 2015

Common MTO Residential Locations in New York


Moving to Opportunity Experiment Re-Analysis

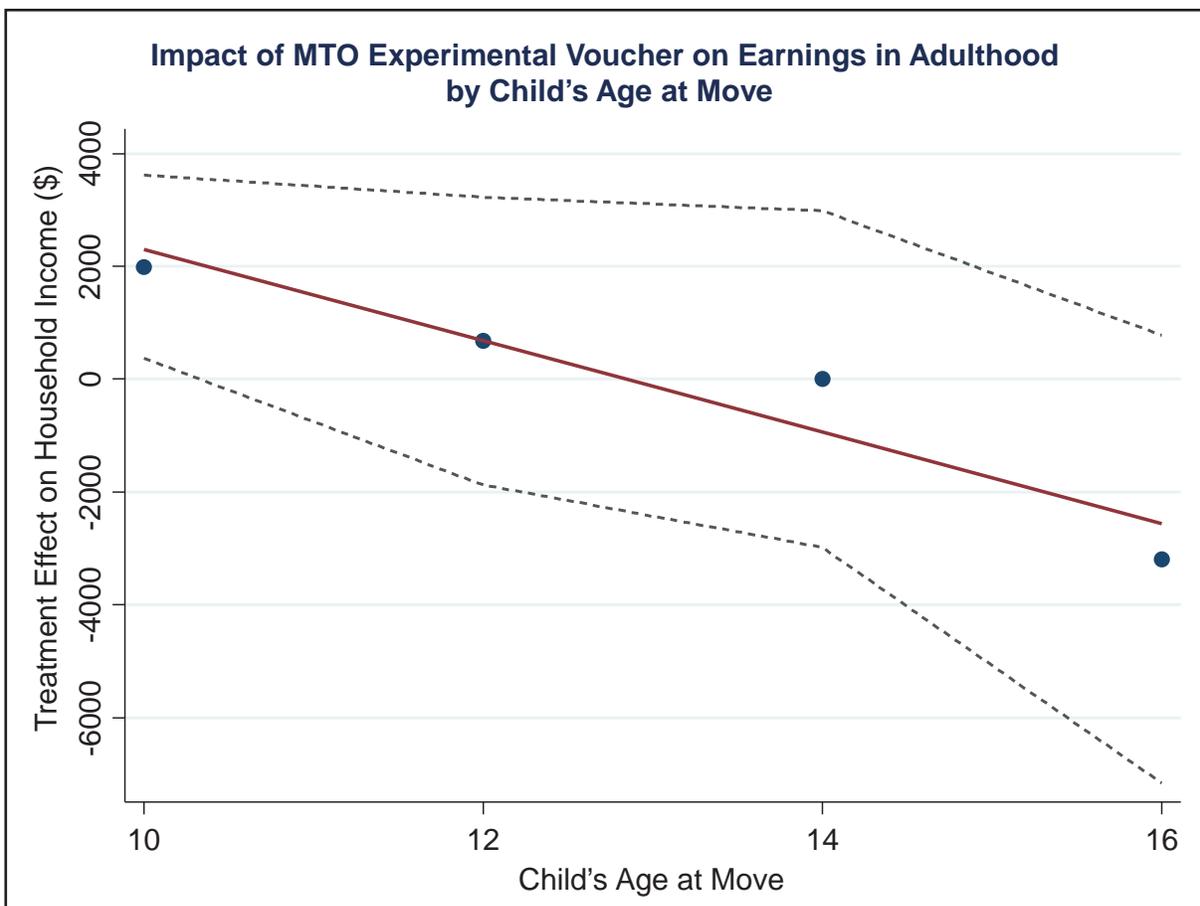
- Children who moved to low-poverty areas when young (e.g., below age 13) do much better as adults:

  - 30% higher earnings = $100,000 gain over life in present value
  - 27% more likely to attend college
  - 30% less likely to become single parents

- But moving had little effect on the outcomes of children who were already teenagers

- Moving also had no effect on parents' earnings

- Confirms that *duration of exposure* to better neighborhood matters, explaining why previous studies didn't find any effects

Impact of MTO Experimental Voucher on Earnings in Adulthood by Child's Age at Move


Key Barriers to Using Administrative Data for Research

1. Scarce bandwidth and limited access

    –   Ex: complex contracting process, few physical locations for IRS; inadequate space in Census RDC's

2. Outdated technology due to scarce resources

    –   Ex: very small investments (~$100K) would greatly relax hard disk, RAM, and processor constraints at IRS

3. Very difficult to link datasets

    –   Ex: linking Census records to tax data would permit analysis of upward mobility by race

▪   Contrast with Danish statistical agency, gold standard for research

Improving Evidence-Based Policy in the U.S.

1. Create a centralized data warehouse that links datasets

    –   IRS data provide an ideal spine for linking other data

    –   Many existing surveys redundant; focus on collecting information not already in administrative data

2. Provide secure, direct access to data with simplified access protocols

    –   Synthetic data do not work well for iterative analysis

    –   Rapid retrieval of statistical results critical; current Census RDC approval often too slow

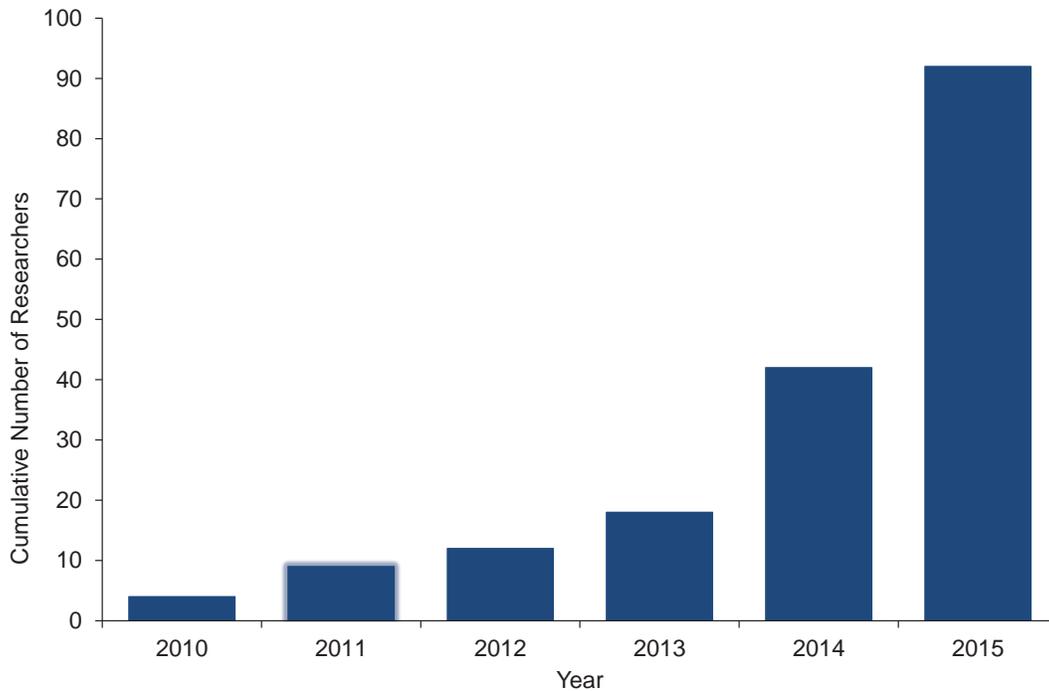
Improving Evidence-Based Policy in the U.S.

3. Start from randomized experiments, but support a broader range of methods

   – Experiments under-powered, especially for studying long-term effects

   – Quasi-experimental methods leverage big data most directly

   – Constructing descriptive statistics to monitor progress (e.g., in local areas) is itself very valuable

Cumulative Number of Researchers who have Written Papers Using IRS Population Tax Data


U.S. Department of Justice

Commission on Evidence-Based Policymaking
First Meeting

The National Academies of Sciences, Engineering, and Medicine
2101 Constitution Avenue NW, Lecture Room
Washington, DC

BUREAU OF JUSTICE STATISTICS

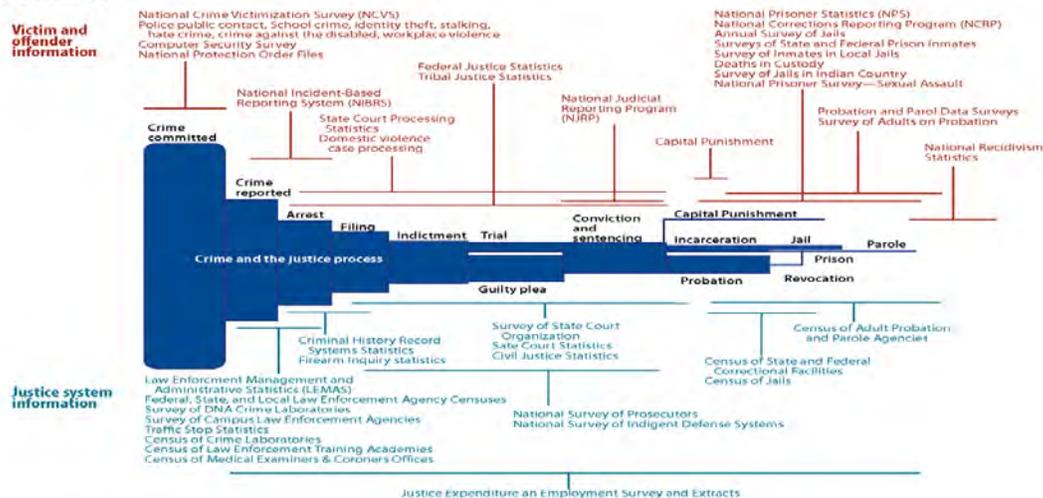
Bureau of Justice Statistics

- A principal Federal statistical agency

- Sits in the Department of Justice Office of Justice Programs
  - FBI, U.S. Marshals, Bureau of Prisons, Drug Enforcement Administration, U.S. Attorney, Civil Rights Division,….

- Measures the U.S. justice system: A collection of independent systems at the local, state, and federal level.

The Criminal Justice System

Bureau of Justice Statistics—Statistical coverage
www.bjs.gov


Why Criminal History Records?

- Important policy or evaluation questions

- Existing data

- Impacts a lot of people.
  - There are roughly 100 million criminal history records.

➡️ Potential for evidence-based policy making

Existing data: Rap Sheets

Each state maintains its own repository.

BJS

Connecting together State Rap Sheets

FBI

Interstate Identification Index

Nlets

BJS

Simplified Description of III System:
A Request for a Multi-State Criminal History Record (or Rap Sheet)

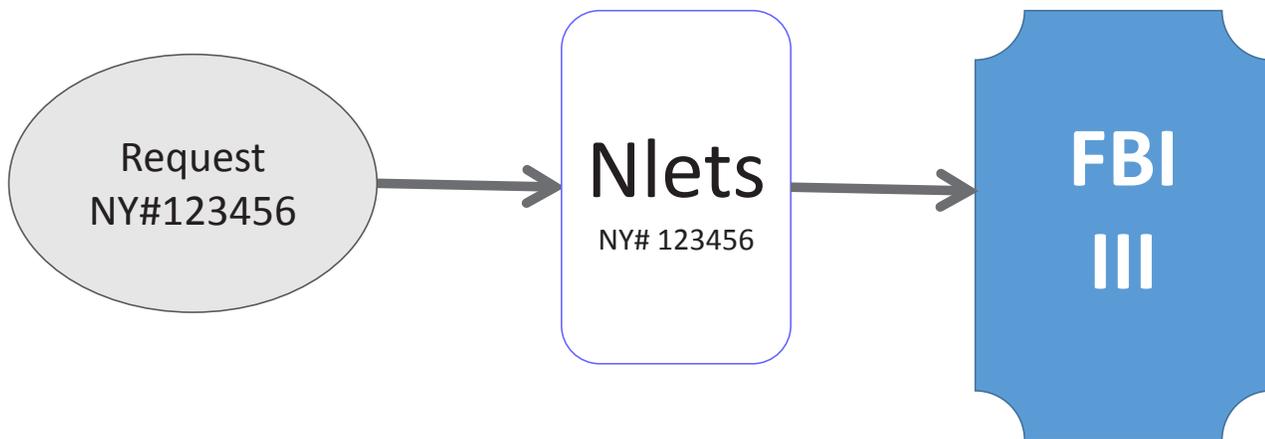
Request NY#123456

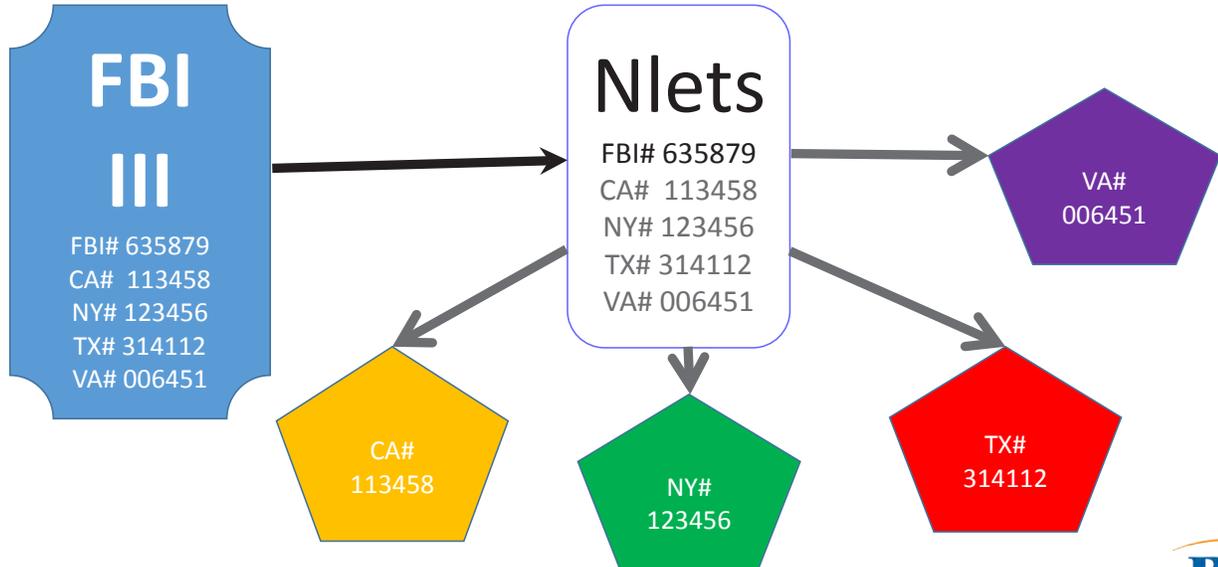
Nlets

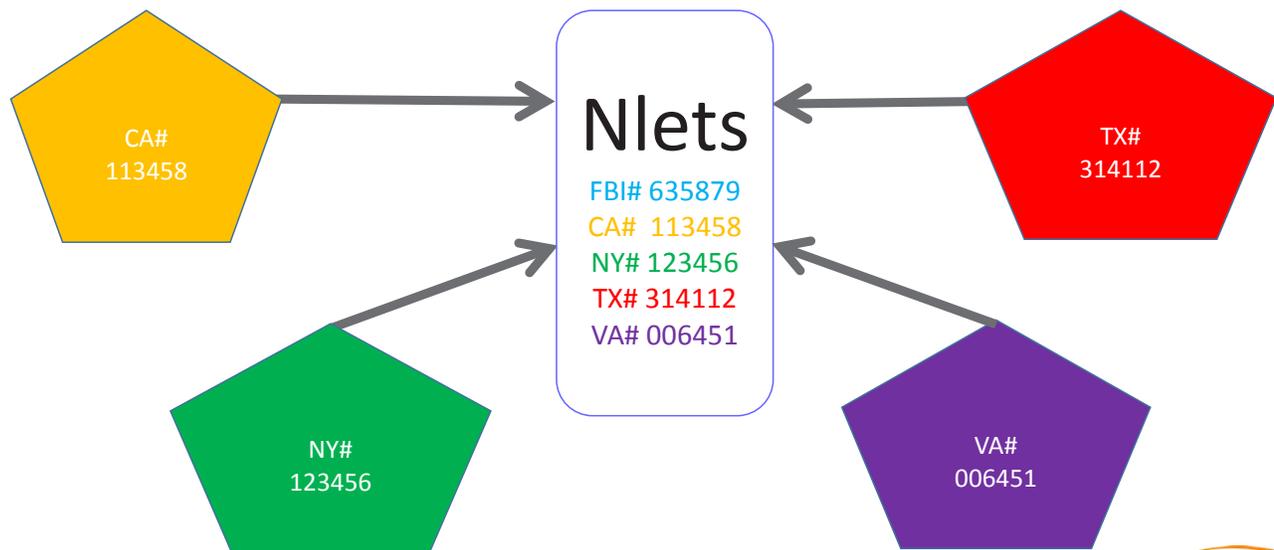
NY# 123456

FBI

III

BJS


III Provides Federal Portion of Rap Sheet to Nlets along with the Person's State ID Numbers; then Nlets Requests State Records


State Repositories Return State-Specific Rap Sheets and Nlets Sends Set to Requesting Agency


Challenges to using Criminal History Records

1. Gaining access

2. Standardizing for statistical purposes

3. Understanding quality

4. Archiving

BJS

Challenge 1: Gain Access (Obtain permission)

2006: Began exploring how to gain the permission to access

2008: Signed MOU with FBI

- Duties of each agency
- Terms of use
- Extensive security provisions
- Point of entry

BJS

Challenge 2: Standardize the Criminal History Records

Step 1: Parse individual state rap sheet data

- Identify key data fields
- Identify location of key data fields in EACH state format
- Create programs to parse text strings
- Copy into a standardized relational database

BJS

Rap sheet fields in the uniform record layout

Subject segment
- BJS case number
- Name
- State identification number (SID)
- FBI identification number
- Date of birth
- Gender
- Race
- Social security number

Court/Sentencing segment
- Court disposition date
- Court name and ORI
- Statute number
- NCIC code
- Offense description
- Type of court disposition
- Sentences (prison, fine , etc.)

Arrest segment
- Date of offense
- Date of arrest
- Arresting agency name and ORI
- Statute number
- NCIC code
- Charge description
- Charge severity
- Arrest disposition
- Arrest disposition date

Supervision segment
- Supervision date (admission, release, etc.)
- Agency name and ORI
- Supervision description

BJS

Challenge 2: Standardize the Criminal History Records

Step 2: Recode state specific data into a common taxonomy

- Map state specific statutes into the common codes
  - Initially done by hand to interpret the statutes
  - Developed automated coding programs/crosswalks
  - Validated the crosswalks
- Maintain and update the library of state to state crosswalks
  - Revise crosswalks as state statutes change or create new crimes

BJS

Challenge 3: Evaluate quality

Data Quality

- Are there parsing and coding errors?
  - Feed back identified errors to Nlets
  - Check for large amounts of uncoded or unknown codes

- Are there patterns of missing data?
  - Feed back identified gaps to States
  - Support states to report more complete data

BJS

Challenge 4: Archiving

This is a remaining challenge –
    Need to balance regulatory restrictions
    With ability to be transparent and reproducible

BJS

Costs*

Developmental costs – about $3.0 million.
    $1.1 million for initial record acquisition, collation, parsing.
    $1.9 million for initially standing up the data standardization software,
        coding crosswalks, creation of recode libraries.

Maintenance costs – about $360,000 annually
    Acquisition, collation, etc. – about $60,000
    Maintenance of standardization software, recode library and crosswalks –
        about $300,000 per cohort study.

    *excludes OJP & BJS staff salaries and overhead.

BJS

A Case Study…

- Enhances Nation's criminal justice data infrastructure

- Potential is still to be fully realized for evidence-based policy decisions

- Continued data quality improvement with use
  - Improves operational uses
  - Improves statistical and research uses
  - Improves evaluation uses

BJS

Thank you!

September 9, 2016 Meeting

CEBP

State Legal Perspectives

Illinois

9 September 2016

CONFIDENTIAL – PROPRIETARY AND PRE-DECISIONAL
Any use of this material without specific permission is strictly prohibited

Illinois Perspectives

1. **Public vs. Private Universities - access to UI data - 20 C.F.R. § 603.**

2. **Data sharing agreements**

    ▫ **the Illinois Enterprise Memorandum of Understanding**

1. Public vs. Private Universities: access to UI data

Code of Federal Regulations on Employee Benefits (Title 20 of the CFR)

20 C.F.R. § 603.4 requires us to keep UI data confidential

20 CFR § 603.5(e) permits us to share UI data with a "public official"

20 CFR § 604.2(d) says that a "public official" can include:

> (5) A State educational authority, agency, or institution as those terms are used in the Family Educational Rights and Privacy Act, **to the extent they are public entities**.

2. Data Sharing Agreements

The Illinois Enterprise Memorandum of Understanding (eMOU) on data sharing

- Internal (but externals are in the works)

- Establishes common agreed to framework and terms

- Employs active management by an Operational Committee

- Contemplates, but does not require, a technological platform across which the data would be shared

- Rapid, compliant, flexible

2. Data Sharing Agreements

The Illinois Enterprise Memorandum of Understanding (eMOU) on data sharing

➢ Educational institutions at all levels (public and private)

➢ Local units of government

➢ Business workforce groups

➢ Criminal justices groups

Thank you

Cynthia Dwork – Evidence-Based Policymaking

Differential Privacy and its Properties

Differential Privacy is a definition of privacy, and a collection of supporting algorithmic techniques, tailored for privacy-preserving statistical analysis of large datasets.

Differential privacy is a mathematical guarantee that an individual data contributor will not be affected, adversely or otherwise, by allowing her data to be used in any study or analysis, no matter what other studies, data sets, or information sources, are -- or will become – available. At their best, differentially private algorithms can make confidential data widely available for accurate data analysis, without resorting to data clean rooms, data usage agreements, data protection plans, or restricted views. Nonetheless, data utility will eventually be consumed: the Fundamental Law of Information Recovery states that overly accurate estimates of too many statistics can completely destroy privacy (Dinur and Nissim, 2003; Dwork et al, 2007; Homer et al, 2008, Dwork et al., 2015b). The Fundamental Law can no more be circumvented than can the laws of physics.

Every useful computation results in some loss of privacy. Differential privacy measures and controls privacy loss accumulating over multiple analyses.   This signal capability makes it possible to "program" in a differentially private fashion. In ordinary, non-private computation, anything computable can be computed using only addition and multiplication, but this is not how programmers work. Algorithm design is the creative combining of appropriate computational primitives to carry out a sophisticated computational task, while minimizing the consumption of key resources, such as time and space. Similarly, differentially private algorithm design is the creative combining of simple differentially private primitives to perform a sophisticated analytical task, while also minimizing privacy loss and inaccuracy. As a rule, when the dataset is large the signal dominates the noise injected for privacy; when the dataset is small this is not the case. This is correct; think of the case of a dataset of size one: to ensure privacy the noise *must* dominate the signal. Designed to preserve the privacy of everybody – even the needles in the haystack – the goal is to elicit participation, without fear of repercussion, for a public good, such as learning that smoking causes cancer, and other facts of life. Indeed, it is often the outliers who most need protection.

Differential privacy also provably controls privacy loss accruing over computations on multiple, possibly overlapping, datasets, making it especially relevant to the kinds of analyses that will be needed for evidence-based policy making.

The Fundamental Law tells us that *meaningful* privacy guarantees come at a price. Other disciplines, such as ethics and economics, cannot be brought to bear without a measure of privacy loss.   Differential privacy provides such a measure (Abowd and Schmutte, 2015).

Finally, differential privacy strengthens the scientific method in an unexpected way, even when privacy is not a concern. The rise of "Big Data" has been accompanied by increased risk of spurious scientific discovery. A great deal of effort has been devoted to reducing this risk, from the use of sophisticated validation techniques, to deep statistical methods for controlling the false discovery rate in multiple hypothesis testing. However, there is a fundamental disconnect between the theoretical results and the practice of data analysis: the theory of statistical inference assumes a fixed collection of hypotheses to be tested, selected *before* the data are gathered, whereas in practice data are shared and reused, with

hypotheses and new analyses being generated on the basis of data exploration and the results of previous studies on the same dataset. This leads to overfitting, that is, learning about the dataset rather than about the population from which it is drawn. Differential privacy automatically protects against this source of false discovery (Dwork et al., 2015a).

Key Considerations

Differential privacy holds great promise but requires great effort. The Fundamental Law forces economic considerations in how data should be used, increasing the imperative for high quality differentially private algorithms, but the field is young and many of these will be the content of doctoral dissertations not yet written. The literature is silent on crucial preprocessing steps, such as imputation of missing fields and other aspects of data cleaning. Working with formal privacy guarantees requires a new skill set, foreign to most statistical agencies, social science researchers, and data scientists. Recent adoption of the approach by Google and Apple will draw talent away from the public and research sectors.

But what is the alternative? The distinction between Personally Identifiable Information (PII) and non-PII is not mathematically meaningful. In the words of the President's Council of Advisors on Science and Technology, "Anonymization is increasingly easily defeated by the very techniques that are being developed for many legitimate applications of big data. In general, as the size and diversity of available data grows, the likelihood of being able to re-identify individuals (that is, re-associate their records with their names) grows substantially" (PCAST, 2014). Traditional statistical disclosure limitation methods ruling out subtraction attacks do not defend against other attacks (Fellegi, 1972, and subsequent generalizations).

It is a consequence of the Fundamental Law that all privacy-preserving computations must introduce some error. Current statistical disclosure limitation (SDL) techniques also introduce errors. For example, one paper states, "These algorithms [with formal privacy guarantees] are currently being implemented on data gathered at a national statistical agency on which we empirically evaluate the utility of our algorithms. We show that for reasonable values of the privacy loss parameter … the error introduced by our provably private algorithms is comparable or better than the error introduced by existing SDL techniques" (Haney et al., 2015). Similarly, a study on privacy in massive open online courses (MOOCs) data from MITx and HarvardX on the edX platform reported that standard anonymization methods force changes to datasets that "threaten replication and extension of baseline analyses" (Daries et al., 2014). When the errors are introduced in a principled way, as in differential privacy, the analyst can better interpret the results.

Even synthetic data (Rubin, 1993) can be problematic. Once constructed, synthetic data may be queried ad libitum, with no risk of further privacy loss, using the analyst's choice of techniques. However, privacy is *not* an automatic consequence of the data being synthetic, but depends crucially on the process by which the synthetic data are constructed. (The Census Bureau uses synthetic data generated with a variant of differential privacy in OnTheMap, a website providing information on where people work and where workers live (Machanavajjhala et al., 2008).)

Recommendations

I close with three policy recommendations. First, *Publish Your Epsilons*. Differentially private algorithms are equipped with a privacy parameter, usually called epsilon, capping their privacy loss. In a non-private algorithm epsilon is infinite. But what is the "meaning" of a given value of epsilon? By maintaining a registry of privacy loss, akin to a toxic release registry, we can observe the accuracy/privacy tradeoffs actually made and stimulate competition to obtain better analyses at lower privacy costs, engaging those who traffic in the data of individuals in the effort to protect their privacy.

Second, *Establish a list of approved private data analysis techniques and appropriate applications, and keep it current*.

Third, *Consider Restraint*. In a data-rich world, the challenges revolve around the trade-off between what can be done and acceptance of the fundamental truth that overly accurate estimates of too many statistics can destroy privacy. If we are interested in privacy, sometimes restraint might be the right approach.

OPENJUSTICE

Data-driven public safety

Justin Erlich, Special Assistant Attorney General
Office of Attorney General Kamala D. Harris
California Department of Justice

OpenJustice.doj.ca.gov

What is OpenJustice?

*A **transparency** initiative led by the California Department of Justice that **publishes criminal justice data** so we can **understand how we are doing**, hold ourselves accountable, and **improve public policy** to make California safer.*

Vision For OpenJustice

- Ongoing national conversation on how to **strengthen trust** and **improve performance** of the criminal justice system

- **Smart on Crime approach** – transparency & metrics
  - ❖ Use transparency to strengthen trust
  - ❖ Develop metrics to understand how we are doing and where to prioritize interventions
  - ❖ Identify evidence-based investigative practices

- **Three key components**
  - ❖ Justice Dashboard to show visually how we are doing
  - ❖ Open Data Portal to make raw data available to public
  - ❖ Data reporting/collection improvement effort

Theory of Change

Collect	Analyze	Publish	Engage
Good data	**Rigorous analytics**	**Transparency**	**Awareness**
▪ Improve quality of existing data	▪ Bring big data methodologies	▪ Release raw data	▪ Engage policy makers and local criminal justice partners
▪ Move towards real time reporting	▪ Partner with researchers	▪ Lift up clear and actionable insights	▪ Inform the community to build trust
▪ Ensure we are have the right data fields	▪ Identify policy improvements	▪ Crowdsource data analysis	
		▪ Share policies that are working	

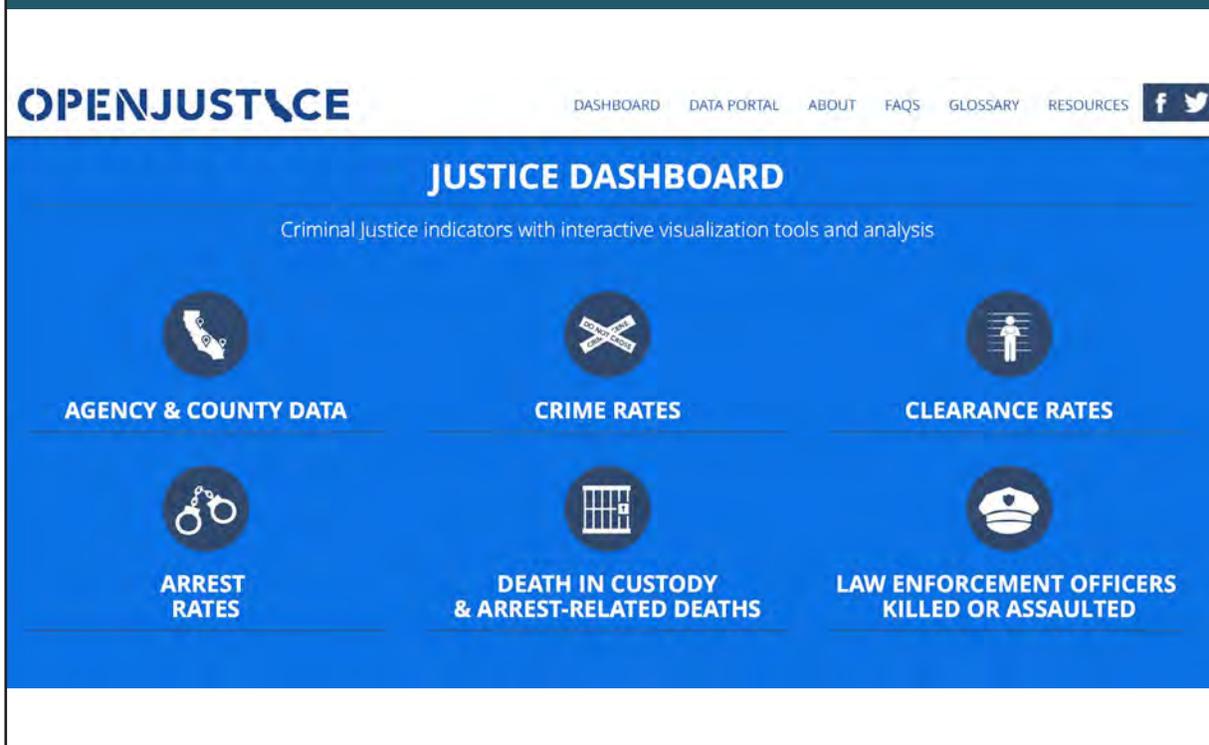
The first six datasets

OPENJUSTICE   DASHBOARD   DATA PORTAL   ABOUT   FAQS   GLOSSARY   RESOURCES

JUSTICE DASHBOARD

Criminal Justice indicators with interactive visualization tools and analysis

AGENCY & COUNTY DATA   **CRIME RATES**   **CLEARANCE RATES**

ARREST RATES   **DEATH IN CUSTODY & ARREST-RELATED DEATHS**   **LAW ENFORCEMENT OFFICERS KILLED OR ASSAULTED**


The Dashboard visualizes the data to give the public a clearer statewide picture

OPENJUSTICE   DASHBOARD   MENU

DEATH IN CUSTODY   OVERVIEW   ARREST RELATED   PRE-TRIAL   SENTENCED   SIDE-BY-SIDE

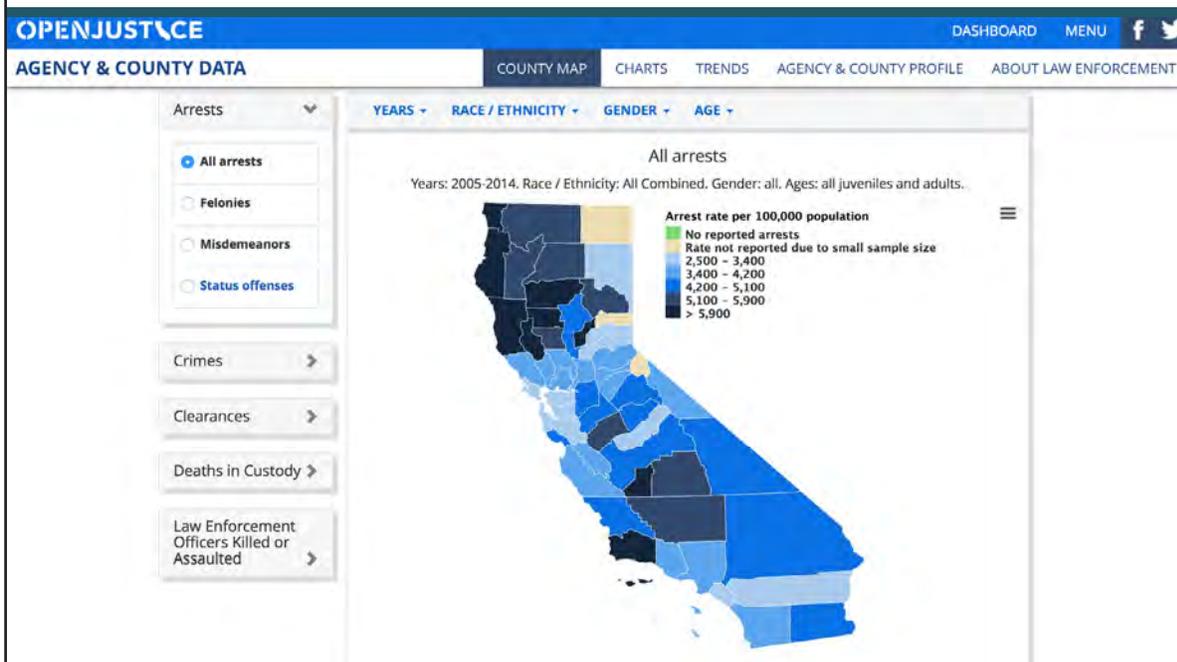
At what stages of custody did the deaths occur?

Most deaths in custody occurred among jail and prison inmates serving their sentences after a conviction. Roughly one-third of deaths occurred during the process of arrest or in a pre-trial stage of custody.

Total = 6,837

Number of Deaths

Arrest-Related | Awaiting Booking | Booked & No Charges Filed | Booked & Awaiting Trial | Sentenced | Other

It also shows differences across counties and agencies throughout the state


❖ **Includes contextual data such as pop. demographics, education, employment, etc.**

Open Data benefits & risks

Benefits

❖ Data is a "public good"

❖ Transparency builds trust

❖ Open by default is a signaling function; reduces transaction costs

❖ Increases potential for research capacity by expanding access

❖ Unlocks innovation and possibilities

Risks

❖ Identity disclosure (e.g., Mugshots.com) and/or re-identification

❖ Inferential disclosure

❖ Bad data = bad policy

Tensions unique to criminal justice data

- ❖ Unlike most health and education data, certain criminal justice data tends to be available in local jurisdictions (e.g. court records, PRAs)

- ❖ But aggregated statewide "Criminal Offender Record Information" (CORI) is still confidential

- ❖ Criminal records can be stumbling blocks to getting jobs, housing, etc. so stakes are high

- ❖ There are additional access points (e.g., press releases, news coverage) that makes open criminal justice data particularly vulnerable to linkage attacks

- ❖ No guidelines like HIPAA or FERPA in the law enforcement space

Key attributes of the data

- ❖ In addition to unique identifiers (e.g., Name), there are a generally a core set of data fields that can be quasi-identifiers:
    - ❖ Gender
    - ❖ Race
    - ❖ Age
    - ❖ Offense Type
    - ❖ Date of Offense
    - ❖ Location/jurisdiction of incident

- ❖ The problem of small numbers and geographical boundaries
    - ❖ Small cities, counties, law enforcement pose the biggest challenges
    - ❖ As we move to more granular geographical data collection, this will only get more challenging

- ❖ We are exploring "binning"
    - ❖ Combining into age buckets
    - ❖ Month of offense rather than date
    - ❖ Aggregating jurisdictional data under a certain population

Dataset snowflakes

❖   Each dataset may contemplate a different balancing test, depending on whose data we are dealing with

❖   Different stakeholder groups, including:

> ❖   Victims of crimes (e.g., sexual assault, DV, child abuse)
> ❖   Decedents or relatives (e.g., death in custody)
> ❖   Gun owners
> ❖   Law enforcement personnel
> ❖   Special class groups (e.g., Juveniles, mental health patients)
> ❖   Individual arrested but released, acquitted etc.
> ❖   Individuals convicted

"Responsible transparency"

➢ **Tiered data access**
> ➢   "Anonymized" data on open data portal + data use agreement
> ➢   Some data w/ PII available to external researchers upon application
> ➢   Some data only available to internal researchers

➢ **Strategy for "anonymized" data**
> ➢   Holding internal conversations on risk appetite
> ➢   Forming committee of experts to advise on value of granularity vs. risk of re-identification
> ➢   Seeking collaboration with data scientists to model risks and provide recommended levels of depth
> ➢   Exploring hack-a-thon approach to stress test data for disclosure risks

➢ **Transparency on transparency**
> ➢   Drafting white paper on how we approached this issue and developed our policies

Building Trust is Critical to an Evidenced-Based Culture: Lessons from the Education Sector

Data Answer Key Questions

Parents — Is my child on track to graduate ready for opportunities?

How do I know if my students are learning the material? How can I improve my teaching? — **Teachers**

School leaders — Are more of our students prepared for college and careers than last year?

Are colleges, universities producing enough graduates with right degrees or skills to meet the employer's needs? — **Policy makers**

Public — How are the schools in my community performing?

DQC DATA QUALITY CAMPAIGN

THE BIG IDEA

What does it mean to *use data* in service of student learning?
Data is one of the most powerful tools to inform good decisions and create opportunities for students along their education journey—and it's much more than test scores. Data helps us make connections that lead to insights and improvements. Everyone has an important role to play in helping all students succeed in their own individualized ways. Here's what it will look like when data is working for all students.

STUDENTS
"I know my strengths and where I need to grow. I can shape my own education journey."

MY EDUCATION JOURNEY

GUIDANCE COUNSELORS

RESOURCE SPECIALISTS

INSTRUCTIONAL LEADERS

SUPERINTENDENTS

PRINCIPALS

TEACHERS
"I know where my students are succeeding and struggling right now. I can help them grow."

PARENTS
"I know what actions to take to help my child on her path to success. I can be a better champion for her."

AFTERSCHOOL PARTNERS
"I know what's happening with these kids before 3:00 p.m. I can help families and communities create more opportunities for students to succeed."

SCHOOL LEADERS
"I know what's working and what isn't in my school. I can make timely decisions and make sure resources support great teaching and improve student learning."

Piece by piece, this ideal is becoming a reality for students. But how can we complete the picture for all students? See DQC's *Time to Act: Making Data Work for Students* for a roadmap to how states can foster this change.

Student Data Privacy: State Legislative Trends

2014: regulating government collection of student data

2015: regulating student data collection by education technology providers

2016: continuing to govern service providers and revisiting existing privacy laws

DQC
DATA QUALITY
CAMPAIGN

Measure What Matters:

Be clear about what you want to achieve for students and have the data to ensure it gets done.

What Federal Policymakers Should Do

- Conduct a review of federal data collections and sunset all unnecessary or duplicative collections.

Make Data Use Possible:

Provide teachers and leaders the flexibility, training, and support they need to answer their questions and take action.

What Federal Policymakers Should Do

- Get your data house in order and better align regulations, laws, communications, and messaging across agencies.

- Break down federal data silos.

Be Transparent and Earn Trust:

Ensure that every community understands how its schools and students are doing, why data is valuable, and how it is protected and used.

What Federal Policymakers Should Do

- Produce timely public indicators based on stakeholders' questions.

- Promote greater federal transparency to help families understand how the federal government collects, uses, and protects data.

DQC
DATA QUALITY
CAMPAIGN

Guarantee Access and Protect Privacy:

Provide teachers and parents timely information on their students and make sure it is kept safe.

What Federal Policymakers Should Do

- Build capacity at the federal level to use data effectively while safeguarding privacy.

  - Expand the ability of the Department of Education to provide expert guidance and help to the field (support the Privacy Technical Assistance Center)

- Provide incentives for states and districts to build capacity for effective data use.

Commission on Evidence-Based Policymaking: Privacy Perspectives

Marc Rotenberg
National Academies of Science
Washington, DC
September 9, 2016

Brief Background

EPIC is an "evidence-based" policy organization. We rely on government statistics and reports for our work.

EPIC also supports the development of new laws and new techniques that enable the use of data while minimizing privacy risks

Served on many expert panels - AAAS, ABA, IOM, IWG, NAS, OECD - with goal of promoting appropriate policy responses to emerging challenges. Currently working with NAS on "Big Data and Privacy" and OECD on Risk Assessment

Speaking for EPIC and not for NAS or OECD

CEBP 2016   2   EPIC

Case Study I: Federal Wiretap Reports

In 1968 Congress created legal authority for electronic surveillance in the United States

Multiple safeguards were established - criminal predicates, application requirements, internal accounting, judicial review and public reporting

The reporting requirement provides a common data set that allows researchers, advocates, and government officials to describe the scope of lawful electronic surveillance in the United States

CEBP 2016   3   EPIC

Wiretap Report 2015

Last updated on December 31, 2015

This report covers intercepts concluded between January 1, 2015, and December 31, 2015, and provides supplementary information on arrests and convictions resulting from intercepts concluded in prior years.

Forty-eight jurisdictions (the federal government, the District of Columbia, the Virgin Islands, Puerto Rico, and 44 states) currently have laws that authorize courts to issue orders permitting wire, oral, or electronic surveillance. Table 1 shows that a total of 28 jurisdictions reported using at least one of these types of surveillance as an investigative tool during 2015.

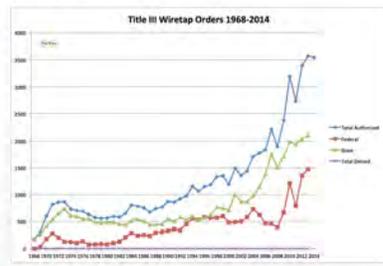
Title III Wiretap Orders - Graphs

Title III Wiretap Orders 1968-2015


Federal Wiretap Reports: Key Conclusions

Stable over time. Mandated by law, not voluntary or dependent on private sector data sources, such as "transparency reports"

Methodology is transparent and data is provable

No privacy risk (no PII collected or published)

Ongoing relevance to policy debate (crypto regulations, Apple v. FBI)

Model for evidence-based policy

CEBP 2016   6   EPIC

Case Study II: NOAA

Weather forecasting, climate data, and satellite imagery

NOAA data supports fishing, shipping, agriculture, and many associated industries

NOAA data also supports mission critical functions, emergency services, and local and state government

No PII!

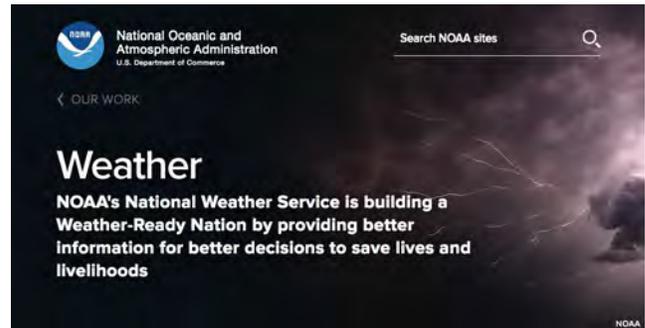
Weather

NOAA's National Weather Service is building a Weather-Ready Nation by providing better information for better decisions to save lives and livelihoods

NOAA


Personally Identifiable Information (PII)

PII is core concept in modern privacy law.

PII = "Data that identifies or could identify a particular person"

PII creates obligations, "Fair Information Practices." Obligations are asymmetric. Custodian of data has responsibilities. Data subjects have rights.

Goal is to ensure fairness, transparency, accuracy, and accountability

New techniques may expand boundaries of PII but that does not diminish significance of concept. As PII becomes more readily identified, responsibilities necessarily follow.

CEBP 2016   9   EPIC

Privacy Enhancing Techniques (PETs)

"Techniques that minimize or eliminate the collection of PII" (Burkhart 1998, Rotenberg 2000)

PETs should be robust, scaleable and provable

We support PETs but have also challenged poorly designed PETs (MD5, Ask Eraser, SnapChat)

CEBP could encourage the development of PETs

CEBP 2016   10   EPIC

Risk of PII Collection

Data breach, identity theft, financial fraud

Identity theft is top consumer concern, 2001-2014 (FTC 2015)

Risks are increasing (voting systems)

Collection of PII poses risk to institutions and to data subjects

CEBP 2016   11   EPIC

Data Minimization

Video Privacy Protection Act (1988)

18 U.S.C. 2710 (e)Destruction of Old Records.—

"A person subject to this section shall destroy personally identifiable information as soon as practicable, but no later than one year from the date the information is no longer necessary for the purpose for which it was collected and there are no pending requests or orders for access to such information under subsection (b)(2) or (c)(2) or pursuant to a court order."

CEBP 2016   12   EPIC

Hard Problems Ahead

Data is increasingly dynamic. It is more difficult to control use, anticipate outcomes, assess risks.

Data is also increasingly under attack from malicious actors. Even well intended data collection and analysis may end badly.

Increasing focus on "Big Data," AI, and Data Analytics ("One Hundred Year Study on AI," White House Report on AI)

Use of data for profiling and prediction has direct impact on individuals, even when not PII.

"Algorithmic transparency"

CEBP 2016   13   EPIC

Data is the basis of research, innovation, economic growth, and informed policy decisions,

14

Data is also the basis for profiling, tracking, segmentation, and discrimination

15

Privacy protections for data are necessary to maximize the benefits and minimize the risks.

16

Confidential Information Protection and Statistical Efficiency Act
(CIPSEA)

Katherine K. Wallman
Chief Statistician
U.S. Office of Management and Budget

September 9, 2016

1

Overview

- What does CIPSEA accomplish?
- Who can use CIPSEA?
- What does CIPSEA look like in practice?
- How successful has CIPSEA been?

2

Purpose of CIPSEA

- Why we need CIPSEA
  - Protection
  - Efficiency
- History of CIPSEA
  - Challenges despite consensus and work left undone

3

Who can use CIPSEA?

- Statistical Agencies
- Recognized Statistical Units
- Others
  - Directly acquired data
  - Through agreement with a statistical agency
- Applies any time an agency 'acquires' data for exclusively statistical purposes, not just surveys

4

CIPSEA in Practice

- Policies
  - Minimize risk of disclosure
  - Severe penalties for willful disclosure
- Procedures
  - Staff training
  - Physical and Information Systems Security (FISMA, off-site inspections, etc.)
  - Disclosure review

5

How Effective is CIPSEA?

- Disclosure prevention
- Response rates
- Participation from agencies

Evidence Commission
A Funder's Perspective DRAFT

November 4, 2016

_{THE} Edna McConnell
Clark FOUNDATION

Overview

The Edna McConnell Clark Foundation has over a decade and a half's experience helping nonprofits use data and build evidence of their programs' effectiveness and improve and expand them to lift the life prospects of greater numbers of economically disadvantaged youth in the U.S. Since 2007, we have leveraged $155 million of our own resources to help 16 grantees secure nearly $487 million in additional private and public funding.

Our grantees and the communities, families and young people they serve have benefited from the increased emphasis that OMB, federal agencies and Congress have placed on evidence-based programs.

We are proud to have partnered with the federal government in the Social Innovation Fund, an initiative enlisting private intermediaries to help expand evidence-based programs.

We are pleased that the Evidence Commission is advancing the "what works" agenda by setting clear standards and expectations for the use of data and evidence in policy and procurement.

And we are honored by the opportunity to share our thoughts and recommendations for your consideration.

Constraints for Using & Building Evidence

EMCF has learned from long experience and recent interviews of over 80 thought leaders that despite increased demand for evidence-based programs, the current approach to **"evidence building"** – amassing empirical data measuring impact, ideally through third-party evaluation – is often too slow, expensive, incremental and insufficient for **non profits and their funders** due to current limitations**.**

- Funding for evidence building and supportive capacities (technology, data, and policy) is limited and too often in the hands of third parties. Nonprofits are forced to take a "pay as you go" approach rather than follow consistent and embedded practice*.*

- The current roles and incentives of evaluation researchers are not well aligned with practitioners' needs or local context. *Too often non profit providers are the "caboose" of the evidence-building train when they should be the engine.*

- Policy-makers' demand for programs that work runs ahead of nonprofits' ability to deliver such evidence-based programs. *We need a greater supply of organizations and leaders equipped to build and use evidence-based solutions.*

- While policy-makers, government and funders are demanding evidence, they seldom understand the operational, data and funding realities that nonprofits face *AND* they do not use such evidence consistently to set policy or award contracts.

In sum, limited innovation in evaluation, constrained data access and weak links between evidence, public policy, implementation, and financial sustainability constrict the pipeline of evidence-based programs worthy and ready for large-scale investments by philanthropy, government, and not-for-profits.

The Edna McConnell Clark Foundation   **2**

Potential Solutions

Drawing on our grantmaking experience and recent research, we offer the following ideas for consideration by the Evidence Commission.

- Service providers are often on the front line of implementing federal programs, but they lack a close connection to government that would make it easier for them to innovate, contribute to, take advantage of, and execute evidence-based policy decisions
  - Encourage better understanding of the **role and magnitude of the private providers' network** in the development and delivery of evidence-based practices.
    - Alliance for Strong Families and Communities estimates 109,515 human services agencies.
    - $750m budget for services in Child Welfare in NYC alone for preventive and foster care service procured through the private sector.
    - Wisconsin has >100 agencies providing foster care
  - Consider a platform for engaging nonprofits and educating the field on the **process of evidence building** as a way to extend and expand beyond its statutory lifetime the Commission's efforts to reach this important sector.

- Support efforts to promote, prioritize and **incentivize the use of evidence in procurement.** Help ensure a clear and unambiguous link of funding to the building & use outcomes.
  - Use evidence to accurately match programs to the needs of target populations, avoiding one-size-fits-all thinking.
  - Support efforts to promote providers' **evidence building & outcomes, not just compliance.**

- Set clear **evidence and data standards and requirements** that can be shared across government and the private sector.

- Remove **barriers to accessing federal, state and local data** and **promote the linkage and aggregation of data by all stakeholders**.
  - Service providers need to access data from various public programs (including, but not limited to, the programs to which they may be directly connected) in order to tailor and track the outcomes of interventions for the communities they serve.
  - Pooled data creates healthy, affordable comparison groups that facilitate evaluation and learning.

The Edna McConnell Clark Foundation   **3**

Partners in Building Evidence

The Evidence Commission can encourage both public and private funders to support the "what works" agenda in the following ways:

- Fund data collection, evaluation, and learning as ongoing **standard operating procedure.** Evidence building is a continuous rather than intermittent, one-study-at-a-time process. Far from overhead, it is integral to a nonprofit's success and requires investment in:
  - Talent (leadership, data scientists, analysts, evaluators)
  - Technology and tools
  - Strategic evaluation planning

- Build or buy **the capacity to use data** to generate evidence, and ensure that service providers and communities have access to these assets.

- Foster a better **understanding and use of different levels of evidence** and **prioritize investment decisions based on data and evidence**.
  - Entry evidence reviews
  - Clearinghouses
  - Inform and align policy priorities with federal data and evidence standards

- Use data to identify and then **fund gaps in evidence** where it is critically needed to address policy priorities.

- Incentivize **innovation of less costly tools and more timely approaches** to evaluation.

- Understand where federal and state government is constrained and leverage philanthropy to **expand the pipeline** of policy-relevant evidence-based programs.

- **Hold researchers and technical assistance providers accountable** for designing evaluations appropriate to the stage of organizational development and the capacity of nonprofits and to the communities they serve.

The Edna McConnell Clark Foundation   **4**

Statement of
Adam Gamoran
President, William T. Grant Foundation
New York, NY

To the
Commission on Evidence-Based Policymaking
Washington, DC

Panel on
"Non-Governmental Demand for Evaluation: Capacity to Support Public Good Activities"

November 4, 2016

Adan Gamoran
Statement to the Commission on Evidence-Based Policymaking
Panel: "Non-Governmental Demand for Evaluation: Capacity to Support Public Good Activities"
November 4, 2016.

Thank you for the opportunity to speak today about one of our nation's most vexing challenges: serving the public good by making smart policy decisions using data that our government already collects.[1] The Commission on Evidence-Based Policymaking offers a rare opportunity to overcome significant barriers that prevent us from achieving this goal. My aim is to provide a non-governmental perspective on two key issues facing the Commission:

1. What data are needed to support public good activities?
2. What steps are needed to build the capacity to *use* data and create the *evidence* required for better policy decisions?

The William T. Grant Foundation, which I lead, supports social science research to improve the lives of young people ages 5 – 25 in the United States. Within this overall mission, we have two areas of focus. The first is to support research on reducing inequality among young people, and the second is to support research on improving the use of research evidence in policy and practice. These priorities would be greatly aided if the Commission were able to accomplish its goals.

As background to my remarks, I call your attention to the legislation that established the Commission. Your primary charge is to determine how agencies of the federal government can share and link administrative data sets, and accomplishing that aim would be a significant step forward. However, a complete reading of your mandate suggests you need not stop there. The Commission is uniquely positioned to consider how the federal government can use data to create the evidence required to achieve our policy aims, as well as how to create the infrastructure to support the use of evidence in policymaking. In other words, be the *evidence commission*, not just the *data commission*.

This broader approach is fully within your charge, and you can meet the challenge it sets forth by prioritizing its call to show how data "may be integrated and made available to facilitate program evaluation, continuous improvement, policy-relevant research, and cost-benefit analyses by qualified researchers and institutions," and by emphasizing "how data and results of research can be used to inform program administrators and policymakers to improve program design."[2] It is principally these elements of your charge to which my remarks offer a response.

---

Data Needs: Multiple Purposes of Linked Administrative Data

Sharing and linking administrative data is necessary but will not suffice to achieve the broader goals of the Commission. Rather, data must be deployed in research and evaluation to create research evidence that informs policymaking. This would optimize the use of data we already collect to make smarter policy decisions. By "research evidence" I mean evidence derived from applying systematic methods and analyses to address a predefined question or hypothesis. Examples include descriptive studies, intervention studies and evaluations, meta-analyses, and studies on cost effectiveness. Policy insights can emerge from a variety of types of research studies, and, consequently, linked administrative data has multiple purposes and offers diverse contributions to policymaking. As a private funder of research intended to improve the lives of young people in the U.S., the Foundation has identified a range of cases for which linked administrative data can address critical questions. Among these are rigorous evaluations of program impact, both experimental and quasi-experimental; program improvement efforts, including performance management; and descriptive studies that contribute to policy formation.

Rigorous Evaluations of Program Impact

As is widely discussed, administrative data can be a powerful tool when attached to randomized evaluations of program impact. At an earlier meeting, the Commission heard from Raj Chetty of Stanford University, who obtained tax data that enabled him to test for long-term effects of the Moving to Opportunity Study. His results overturned previous findings, transforming our understanding of how housing voucher program effects may occur. If such federal data were available to a wider range of researchers, we would have more secure answers to many important questions about program impact. Also frequently mentioned is the value of administrative data for short-cycle randomized trials. Because administrative data are already being collected irrespective of whether a program evaluation is taking place, linking existing data to the evaluation study substantially reduces the cost of the study, and may accelerate its completion and lead to more real-time information on whether programs are meeting their aims. For example, the Laura and John Arnold Foundation has stimulated the research community to pursue this course to take better advantage of data already being collected.[3]

Two randomized experiments that our Foundation is funding — one by Joseph Allen at the University of Virginia and the other by David Yeager at the University of Texas-Austin — use administrative data to assess the impact on academic and social-emotional outcomes of interventions designed to improve young persons' social psychological functioning. These investigators face the laborious task of collecting administrative records from each school, one school at a time. Particularly in the case of the Yeager study, which includes nearly 100 schools, this task demands countless hours from both researchers and school personnel, and great expense to the funders. Yet much of the data — notably the academic outcomes — are reported up to the state and even the federal government, and if there were a data linkage system in place, they could be gathered much more efficiently. Indeed, this is one of the reasons we funded the Stanford Educational Data Archive, which includes test scores from all 50 states calibrated on a common scale.[4] But since the National Center for Education Statistics that supplied these data has no provision for releasing individual-level data from state assessments, the data are aggregated to the level of grades within schools, which constrains their utility for some purposes.

---

[4] See: https://cepa.stanford.edu/seda/overview

Administrative data also have great value for quasi-experimental studies, which can often be conducted without additional data beyond the administrative records. Professor Chetty has already spoken to the Commission about how his analysis of tax records for five million geographically mobile American families revealed the importance of neighborhood quality for economic mobility. In a study funded by our Foundation, Cornell economist Michael Lovenheim and his colleagues were able to connect Texas state administrative data from K12 education, higher education, and employment and, using a difference-in-difference design that permits causal inference, test the effects of two university scholarship programs for high-achieving, low-income youth on college and workforce outcomes.[5] In another study we are currently funding, researchers at Duke University have cleverly used job loss information from North Carolina as a statistical instrument to test the effects of economic and family changes on children's academic development.[6] This research was only possible because the investigators were able to link administrative data from the state education and employment systems.

It is no accident that these two examples come from Texas and North Carolina. Along with Florida, these states have the most efficient systems for external researchers to obtain access to statewide education data. Consequently, much of what we know about federal and state education policy effects, particularly those based on rigorous quasi-experimental methods, comes from these three states, and we cannot be certain about how findings from these states generalize to other states. Ironically, thanks to federal data requirements under No Child Left Behind and subsequent federal incentives to states, all states now collect a large volume of education data, with students linked over time and to their schools and, in most cases, to their teachers. However, in far too many states the data languish unused except for compliance reports under federal law. These data are an untapped treasure the Commission could help uncover by advocating for federal guidelines that would facilitate the research use of state education data while protecting the privacy of personal information as Texas, North Carolina, and Florida have carefully done.

Program Improvement

Many, and perhaps most, experimental and quasi-experimental studies focus on a narrow question: What is the impact of a program on a particular outcome? Increasingly, however, our grantees recognize that the answer to this question is of limited policy value. Although it indicates whether a program is working or not, it does not say what works ***for whom*** and under ***what circumstances***, nor does it say what steps may be undertaken to achieve the desired results. These questions are important because single evaluations rarely suffice to make decisions about program continuation or discontinuation. Instead, they are most useful if they point the way towards improvement. As Ron Haskins and Greg Margolis have explained, "An important part of a comprehensive, evidence-based strategy will be to continue funding programs that initially receive disappointing evaluations. Part of the federal evidence-based culture should be that federal agencies will work with programs and continue funding them as long as they are using evidence to improve their outcomes and are showing some progress."[7]

Program improvement cannot happen without data about when and why a program works well or struggles. Some of our recent grants have supported methodological work to better understand treatment effect heterogeneity, that is, differences in how the same program may work differently for different people or in different places.[8] These technical advances, however, rest on the availability of data to identify conditions that may be related to heterogeneity. If randomized trials are often undertaken as "black box" studies — particularly short-cycle randomized trials — administrative data may allow us to peer into the box to see what is actually going on.

On the government side, many are aware of the need for such administrative data, and this was a topic of discussion in a learning community that our Foundation organized for staff of federal evaluation and research agencies. As one participant commented, "research needs to provide more information about community context, implementation, health equity, and costs, as well as info about what facilitated or impeded success." Another elaborated, "on the grant competition side we have been adding requests for researchers to add more on context, but that leads to questions about what question should be asked across studies, what data is cheaply available." The Commission could encourage this work by providing guidelines for federal grantmakers that would strengthen researchers' access to contextual and implementation data, and by calling for agencies to make administrative data available in response to these needs.

Performance management is a tool used for program improvement that relies substantially on administrative data.[9] To assess the outcomes of a government program, however, a federal agency typically requires administrative data that are gathered elsewhere within the government. While current federal law requires agencies to set performance goals, it does not require them to share the data that are needed by other agencies to assess progress towards those goals. The Commission can bolster federal program improvement efforts by recommending policy changes that will support goal setting with data-sharing requirements. For example, laws that require evaluation could specifically require data-sharing agreements.

Policy Formation

A third purpose of linked administrative data is to understand the nature of the challenges facing our nation and to identify possible programs and policies that may address them. For instance, President Obama has declared that income inequality is "the defining challenge of our time."[10] Data that our government already collects, but which are not currently well used, could help us formulate more effective policies to respond to this challenge. Two examples illustrate this point: Linkages between state education records and national surveys can identify ways to reduce educational inequality; and the American Opportunity Study, a national effort to link census, program, and survey data, can yield ways to increase upward mobility on the ladder of economic success.

Linkages between state education records and national education surveys. Educational inequality is a fundamental aspect of broader inequities across our nation, so reducing educational inequality is an important goal. Evidence about educational inequality comes from national surveys as well as from state administrative records. Linking the two sources of data would offer an especially powerful tool for crafting effective policies. While state data contain valuable information about the performance of students, teachers, and schools, they typically lack the contextual information needed to understand program and policy effects. Longitudinal surveys, by contrast, often have rich contextual information but lack repeated data on student outcomes, and often lack detailed information on teachers and course enrollment. Linking the two data sources would strengthen the evidence offered by each.[11] In particular, linking state data to in-depth longitudinal surveys carried out by the National Center for Education Statistics (NCES) would allow a much richer exploration of policy effects within and among states.

During the Obama administration, NCES officials negotiated with ten state education agencies to prepare to link a national longitudinal cohort study of high school students (a common type of NCES survey) with state education records. NCES did its part by oversampling students in each of the ten states so the linked samples would be representative of each state and large enough to test policy-relevant hypotheses. But as I have written elsewhere, "ultimately not a single state provided its data for linkage with the national survey. Despite agreement at the political level, NCES and its state counterparts were unable to resolve the bureaucratic barriers to linking state and federal data."[12] This unfulfilled promise is ironic because the state longitudinal data sets were largely built with federal grants to states, yet the federal government failed to use its leverage to compel or even encourage states to make their data available for linkage. The Commission could address this challenge by recommending legislative or administrative language that helps states understand the value for their own decision-making, as well as for achieving national goals, of connecting their data systems to national data with in-depth information about family background, students' experiences within schools, school context, and other conditions relevant to policy formation and outcomes.

The American Opportunity Study. As David Grusky, Tim Smeeding, and Matt Snipp have written, given the high importance that Americans attach to equal opportunity, one might expect us to have a robust system for monitoring social mobility and its responsiveness to policy changes.[13] By social mobility, we mean the chances that persons born into disadvantage can rise above their circumstances of origin to achieve educational and occupational success as adults. Despite the salience of this notion, our ability to monitor changes in mobility is weak. The last major survey of U.S. mobility, the second study of "Occupational Changes in a Generation," occurred over 40 years ago. Today, however, a standalone survey is not needed to gauge patterns of mobility across generations. In fact, we can do so even more effectively than in the past by linking data from the U.S. census to federal administrative data and to existing national surveys that are already being conducted. Grusky, Smeeding, Snipp, and others have proposed that a new American Opportunity Study (AOS) can be accomplished without the need for a new survey, by linking existing data. Key components of the AOS include decennial census records,

[13] Grusky, D. B., Smeeding, T. S., & Snipp, C. M. (2015). A new infrastructure for monitoring social mobility in the United States. *Annals of the American Association of Political and Social Science*, 657, 63-82.

federal tax and employment records, state data from federal programs such as food stamps and unemployment insurance, and national surveys that are already being conducted such as the American Community Survey, the Survey of Income and Program Participation, and others.

The AOS would carry substantial benefits for those wishing to assess mobility trends and to formulate and assess policies that aim to strengthen equal opportunity processes. As the authors explain,

> The United States has an unassembled panel that is standing unused and that, for a relatively small outlay, could be transformed into a major new infrastructural resource in the social sciences. The AOS comes with substantial cost savings and efficiencies, allows the United States to formulate child development and labor market policy using high-quality evidence, and would lead to a renaissance of labor market and mobility research that would almost surely reestablish the United States as a leader in the field.[14]

The AOS would permit more powerful assessments of conditions that foster and reduce inequality in domains such as neighborhoods, family structure, health, justice, education, and veterans' affairs.[15] These assessments would allow formulation of evidence-based policies. When linked to research study samples, the AOS could also support program evaluation in many areas.

Despite the promise of this approach for meeting the inequality challenge that President Obama has called out, substantial barriers remain. Most important, much of the data about program participation resides at the state level, even for programs supported by federal funding. If we wish to know whether our policies are working, we need to know who is participating and what their long-term and even intergenerational trajectories are. We can accomplish this aim by linking program participation data to census and employment records, but only if states cooperate with federal agencies in data sharing. The federal government ought to have leverage in this regard because the programs are federally funded. The Commission could address this challenge by recommending legislative language that would require states to share data on program participation for purposes of research on policy formation and evaluation.

Linking ongoing national surveys to administrative data represents another challenge. I understand that for Census Bureau surveys such as the American Community Survey and the Survey of Income and Program Participation, such linkages are already occurring and data can be analyzed in the secure Federal Statistical Research Data Centers. The Commission may wish to urge other federal agencies and non-governmental research groups to collaborate with the Census Bureau to add additional surveys to this infrastructure.

More broadly, the Commission should aim to standardize and streamline procedures to facilitate linkages among these disparate sources of data, and encourage a bureaucratic/legal environment in which such linkages are viewed as assets. To accomplish this goal, the Commission should provide a framework that articulates the technical requirements, legal standing, and accepted procedures for linking and sharing data across federal agencies and with willing state partners. The framework should specify the different types of data that may be linked, including administrative, survey, and experimental data, and the different purposes of such linkages, including program continuation decisions, program improvement plans, and policy formation.

[15] National Academies of Sciences, Engineering, and Medicine. (2016). *Using linked census, survey, and administrative data to assess longer-term effects of policy*. Proceedings of a workshop in brief. Washington, DC: National Academies of Sciences, Engineering, and Medicine.

The Commission might further recommend a pilot that would begin with specific agencies that, based on the investigations of the Commission, seem best prepared to implement a standardized procedure for linking data and making data accessible to researchers inside and outside of government. With support from the Laura and John Arnold Foundation and in partnership with the U.S. Census Bureau, Chapin Hall at the University of Chicago is sponsoring a series of studies to demonstrate innovative approaches to linking administrative data, and the Commission could look to these studies as examples.

Building Capacity for Using Linked Data to Conduct Research and Inform Policies

Thus far I have discussed the value of administrative data for rigorous evaluations of program impact, program improvement, and policy formation, and I outlined a series of recommendations for improving the linkages among, and access to, these data while protecting privacy. I could choose to conclude my remarks now, and indeed, the Commission could choose to limit its focus to the tasks of linking and sharing administrative data while protecting privacy.

But doing so would not take full advantage of the opportunity at hand. As I noted at the outset, the Commission is uniquely positioned to advance the capacity to support the use of evidence in policymaking. By capacity I am referring to the technological structures, human capital, organizational arrangements, and fiscal investments needed to create and use evidence. These considerations are often an afterthought and therefore under-resourced. Because they are fundamental to the creation of evidence, they demand attention at the outset.

Over the course of my career, I have thought a lot about the capacity required to support the production and use of evidence. Prior to my current role, I directed the Wisconsin Center for Education Research, the oldest and largest university-based education research center in the country. My job was to ensure that we had the structures in place both to generate evidence and connect with those who might use it. In my current role as president of a foundation that funds studies to identify and test strategies to improve the use of research evidence at the federal, state, and local levels, **I am learning continually about the conditions needed to facilitate evidence use. This knowledge has been deepened by my observations of the learning community we facilitated for federal research and evaluation staff. These experiences make clear that capacity is critical for supporting the production of evidence and its use.**

Yet the current capacity to accomplish this goal is limited. In a government-wide survey conducted by the General Accountability Office, only eleven agencies reported "committing resources to obtain evaluations by establishing a central office responsible for evaluation of agency programs, operations, or projects, although only half these offices were reported to have a stable source of funding. Seven agencies reported having a high-level official responsible for oversight of evaluation."[16] The relative scarcity of evaluation offices and funding has consequences: The General Accountability Office reported that "studies of organization or government evaluation capacity have found that it requires analytic expertise and access to credible data as well as organizational support both within and outside the organization to ensure that credible, relevant evaluations are produced and used."[17]

---

[16] General Accountability Office. (2014). *Program Evaluation: Some Agencies Reported that Networking, Hiring, and Involving Program Staff Help Build Capacity.* GAO-15-25. Washington, DC: General Accountability Office.
[17] Ibid, p.8.

Based on my experiences outside government and my interactions with those in government, I encourage the Commission to respond to the findings from the General Accountability Office as well as to similar concerns raised in a background paper prepared for the Commission.[18] The Commission can make an essential contribution to the advancement of evidence-based policymaking by recommending specific steps (a) to build the capacity of researchers inside and outside of government to use administrative data to answer policy questions, and (b) to establish partnerships between researchers and policymakers that will increase the likelihood that research evidence permeates the policymaking process.

A Federal Infrastructure for Evidence

The Commission can meet its full mandate by providing guidance on ways that data may be used to create evidence that can inform and shape policy. A stronger infrastructure within the federal government would help build the capacity needed to meet this charge. Such an infrastructure could help ensure that the production and use of evidence remains a high priority for our nation's decision-makers. It could also increase the capacity of individual agencies to produce and use evidence. Moreover, a strong infrastructure could help align efforts across agencies, leading to greater consistency and creating opportunities to take on challenges that require cross-agency collaboration.

The Commission may wish to examine infrastructure supports that are found in various agencies, identify best practices, and recommend their wide adoption. One of our grantees is currently conducting a scan of the existing federal infrastructure for statistics, data, performance improvement, behavioral analytics, and evaluation, and has identified a number of supports that could be strengthened for federal evaluation agencies. Examples of such infrastructure elements include:

- Leadership positions focused on evidence use

Leadership positions such as the special advisor for evidence-based policy in the Office of Management and Budget, and the chief technology officer in the White House Office of Science and Technology policy, serve to focus attention on the use of research evidence and are positioned to align efforts across agencies. One role of such leaders can be to foster collaboration between program and evaluation offices within government agencies to establish trust and make joint decisions about what research and evaluation is to be conducted and how the findings may be used.

- Interagency collaborative bodies

An interagency group that regularly convenes staff members from across government agencies offers opportunities for learning and collaboration. Examples include the federal Chief Information Officers' Council, the Interagency Council on Evaluation Policy, and the Committee on National Statistics of the National Academies. In addition to supporting and formalizing such bodies, more could be done to align efforts across the collaboratives focused on data, statistics, and evaluation.

---

[18] Office of Management and Budget. (2016). *Barriers to Using Administrative Data for Evidence Building*. Background paper for the Commission on Evidence-Based Policymaking. Washington, DC: Office of Management and Budget. See: https://www.whitehouse.gov/sites/default/files/omb/mgmt-gpra/barriers_to_using_administrative_data_for_evidence_building.pdf

- A dedicated office for research and evaluation within each agency

The capacity for building and using evidence is highly varied across federal agencies. Some agencies have dedicated research offices, such as the Office of the Assistant Secretary for Planning and Evaluation within Health and Human Services, the Chief Evaluation Office in the Department of Labor, the Office of Policy Development and Research within Housing and Urban Development, and the Institute of Education Sciences within Education. While establishing such offices is important, they must be accompanied by systems that foster communication between research and program offices. As one research leader who participated in our learning community of federal agency staff explained, "When I think about the program offices I collaborate with, and what makes them successful, I think about finding mutual goals, how to help those offices achieve their goals, maintaining regular communication throughout and, most importantly, assuming that there will be different cultures."

- A codified set of principles and practices

As another participant in our learning community of federal agency staff noted, "There isn't much of a blueprint for how federal agencies conduct evaluation." Individual agencies have responded to this need; for example, both the Department of Labor and the Administration on Children and Families in the Department of Health and Human Services have developed policies for evaluation, which is one type of research evidence. A broader set of principles and practices for the creation and use of research evidence is needed, analogous to *Principles and Practices for a Federal Statistical Agency*, which has been influential in setting standards and approaches that statistical agencies across policy domains have adopted. Likewise, the *Common Guidelines for Education Research and Development* have helped the Institute of Education Sciences and the National Science Foundation take similar approaches in understanding and supporting different types of research evidence. Moreover, just as there needs to be an investment in the skills and guidelines for conducting impact evaluations, similar supports should be established for program improvement efforts. The Commission could recommend the development and adoption of principles and practices for evidence creation and use that could become widely shared across federal agencies.

Partnerships for Building and Using Evidence

All too often, evidence about effective or ineffective policies or programs has little bearing on decisions, even when the evidence is rigorous, timely, and accessible. Sustained partnerships between researchers and policymakers can improve the use of research evidence by offering a basis for trust, incentivizing researchers to ask questions that really matter and creating a culture of evidence in the decision-making body. This requires an ongoing dialogue between researchers and decision-makers.

Throughout my remarks I have emphasized the value of administrative data for research and evaluation, and I gave several examples where this approach has been the case. These situations were fortunate; the existing administrative data happened to be what researchers and evaluators needed for their studies. To maximize the use of administrative data for research and evaluation, however, we can be more deliberate in what data are collected. When researchers act as partners to program and policy staff, they can collaborate on decisions about what administrative data to collect. These partnerships can improve the odds that programmatic and policy changes will be informed by the research evidence.

Since 2009, the William T. Grant Foundation has supported studies of the conditions that promote the use of research evidence in policy and practice. Partnerships between researchers and decision-makers emerged as a key finding from this scholarship as a mechanism for getting evidence produced and used. Most common in the domain of education, a research-practice partnership is a sustained structure for facilitating relations of trust and shared goals among university-based researchers and government-based practitioners or policymakers, such as school district officials.[19] The partnership carries two essential benefits. First, because the research agenda within the partnership is co-constructed by researchers and practitioners, the questions pursued in the research are ones whose answers are important to the practitioners. Second, the partnership creates a culture of evidence within the agency, such that looking to evidence before making decisions becomes normative practice. Fundamental to the partnership is the sharing of administrative data that allows researchers to address policy questions of interest to school district decision-makers. Most education partnerships are between universities and school districts, but the state of Tennessee is leading the way by creating a new partnership between Vanderbilt University and the state education agency.

The Commission can improve the use of research evidence by identifying effective partnership models and promoting them across the federal government. Many models of partnership exist, such as those laid out on the website of the William T. Grant Foundation: http://rpp.wtgrantfoundation.org/.

Conclusion and Summary of Recommendations

The Commission on Evidence-Based Policymaking can help researchers outside government contribute more useful research that informs policy by recognizing the variety of purposes for sharing and linking administrative data, and by recommending tools and relationships that strengthen the capacity of policymakers to collaborate with researchers inside and outside of government. A number of recommendations emerge from this account:

Multiple Purposes of Linked Administrative Data

- Advocate for federal guidelines that would facilitate the research use of state data while protecting the privacy of personal information.

- Provide guidelines for federal grantmakers that would strengthen researchers' access to contextual and implementation data, and call for federal agencies to make administrative data available in response to these needs.

- For federal performance management systems, recommend policy changes that support goal-setting with data-sharing requirements.

- Recommend legislative or administrative language that helps states understand the value for their own decision-making as well as for achieving national goals of connecting state data systems to national survey data with in-depth background information.

- Recommend legislative language that would require states to share data on program participation for purposes of research on policy formation and evaluation.

---

[19] Turley, R. N. L., & Stevens, C. (2015). Lessons from a school district-university research partnership: The Houston Education Research Collaborative. *Educational Evaluation and Policy Analysis*, *37*, 6S-15S.

- Urge federal agencies and non-governmental research groups that conduct national surveys to collaborate with the Census Bureau to add additional surveys to the Federal Statistical Research Data Center infrastructure.

- Provide a framework that articulates the technical requirements, legal standing, and accepted purposes or linking and sharing data across federal agencies and with willing state partners.

- Recommend a pilot data-sharing effort, perhaps building on the examples of innovative approaches to linking administrative data.

Building Capacity of the Production and Use of Research Evidence

- Examine existing infrastructure supports found in various agencies, identify best practices, and recommend their wider adoption. Examples include leadership positions focused on evidence use; interagency collaborative bodies; dedicated offices for research and evaluation; and codified sets of principles and practices.

- Identify models of partnerships between researchers and policymakers, and promote their use across the federal government. Consider local and state examples as models for the federal level.

These recommendations are ambitious, but the Commission is such a unique opportunity that lofty goals are warranted. As my colleagues have written, "research evidence can improve public policies and programs, but fulfilling that potential will require honest assessments of current initiatives, coming to terms with outsized expectations, and learning ways to improve social interventions and public systems."[20] The Commission is well positioned to drive this work forward, especially if it focuses on the full continuum of activity from sharing and linking data, to using those data to create research evidence, to using that evidence to inform policymaking.

The Message

Be the Evidence Commission, not just the Data Commission.

Data Needs

Research evidence
- Derived from applying systematic methods and analyses to predefined questions or hypotheses

Multiple purposes of linked administrative data
- Rigorous evaluations of program impact
  - Experimental
  - Quasi-experimental
- Program improvement
- Policy formation

William T. Grant
F O U N D A T I O N

Program Improvement

- What works for whom and under what conditions
  - Calls for data on context, implementation
  - Conditions that facilitate or impede success
  - Guidelines for grantmakers could strengthen access to data for program improvement

- Performance management
  - Support goal setting with data-sharing requirements

William T. Grant

Policy Formation: Reducing Inequality

Need to understand the nature of challenges we face, and identify policies that respond

Example: Reducing inequality, the "defining challenge of our time"

William T. Grant
F O U N D A T I O N

Policy Formation: Reducing Inequality

Reducing inequality in education

- Link national education surveys to state education records
  - In a national survey, NCES oversampled 10 states
  - Each state education agency had agreed to link education records to the survey
  - "Not a single state provided its data for linkage with the national survey."
    - Bureaucratic/legal hurdles could not be overcome
    - Even though the state data were largely built with federal grants!

William T. Grant
F O U N D A T I O N

Policy Formation: Reducing Inequality

The American Opportunity Study

- ⟩ A standalone survey no longer needed to gauge social mobility
  - ➤ Link census data, federal tax & employment records, state data from federal programs, and national surveys
  - ➤ Create capacity to understand barriers and supports for social mobility
  - ➤ Allow formulation of evidence-based policies
  - ➤ Link to research samples to support program evaluation
- ⟩ Commission could recommend legislation that would require states to share participation data

William T. Grant
FOUNDATION

Policy Formation: Reducing Inequality

The American Opportunity Study

- ⟩ Link national surveys to administrative data
- ⟩ View linkages as assets
- ⟩ Provide a framework
  - ➤ Specify types of data, including administrative, survey, and experimental data
  - ➤ Indicate purposes of linkages, including program improvement and policy formation
- ⟩ Consider a pilot

William T. Grant
FOUNDATION

Build Capacity

Capacity to use data to create evidence is essential to evidence-based policymaking

- Capacity = technology, expertise, organizational arrangements, & fiscal investments
  - ➢ Often under-resourced
  - ➢ Demand attention at the outset
- Strengthen the federal infrastructure for evidence
- Establish partnerships between researchers and policymakers

William T. Grant
F O U N D A T I O N

Build Capacity

Elements of a federal infrastructure for evidence

- Leadership positions focused on evidence use
- Interagency collaborative bodies
- Dedicated office for research and evaluation within each agency
- Codified sets of principles and practices

William T. Grant

Statement of Naomi Goldstein
Deputy Assistant Secretary for Planning, Research, and Evaluation
Administration for Children and Families
U.S. Department of Health and Human Services
to the Evidence-Based Policy-Making Commission

4 November 2016

Dr. Haskins, Dr. Abraham, and Commission members:

Thank you for inviting me to speak with you today. You have a tremendous opportunity to further the creation and use of evidence in the federal government and beyond.

At the HHS Administration for Children and Families, I serve as Deputy Assistant Secretary for Planning, Research, and Evaluation, overseeing a portfolio of grants and contracts to conduct research and evaluation related to ACF programs. I'd like to tell you a bit about how we do our work, highlighting implications for your deliberations, and drawing on ACF's evaluation policy, which establishes five principles to govern our work. These are: rigor, relevance, transparency, independence, and ethics.

I'd like to discuss seven main points:

1.   Data are necessary but not sufficient to create evidence.
2.   Administrative data and ongoing surveys are important resources, but specialized data collected for the purposes of specific evaluations will also continue to be important.
3.   Easier accessibility of administrative data would greatly streamline evaluation activities.
4.   Implementation and descriptive studies are just as important as impact or outcome evaluations, and relevance is just as important as rigor.
5.   Prerequisites for federal evaluation include statutory authority, funding, a skilled federal workforce, and a robust private sector.
6.   Several bureaucratic challenges pose substantial barriers to federal evaluation efforts, in the areas of procurement, information technology and security, and information collection.
7.   The federal evaluation enterprise lacks many elements of the infrastructure that supports and protects the federal statistical system.

One: Data are necessary but not sufficient for evidence that can inform policy and practice.
It is no small thing to collect data that are valid, reliable, relevant, and representative. But data *per se* are not evidence. To turn data into evidence, we must examine them using a sound analysis plan tailored to questions of policy and programmatic interest. In addition, for many questions – especially questions about the impacts of policies or programs – data must be used in the context of an evaluation designed and put into place before the data are collected. A randomized control trial is an obvious example, where the study must assign participants to treatment or control groups before providing services and collecting outcome data.

This point is related to the principle of rigor in ACF's evaluation policy. Rigor means getting as close as we can to the truth. It is not an optional gold seal. Rather, without rigor we may be generating answers that are just plain wrong. ACF's evaluation policy states that we are committed to using the most rigorous methods that are appropriate to the evaluation questions and feasible within budget and other constraints. Rigor is not restricted to impact evaluations, and it is not code for randomized control trials. It is necessary in all types of evaluations, including implementation or process evaluations, descriptive studies, outcome evaluations, and formative evaluations; and in both qualitative and quantitative approaches. Rigor requires ensuring that inferences about cause and effect are well founded (internal validity); requires clarity about the populations, settings, or circumstances to which results can be generalized (external validity); and requires the use of measures that accurately capture the intended information (measurement reliability and validity).

In assessing the effects of programs or services, ACF's policy is to use methods that isolate to the greatest extent possible the impacts of the programs or services from other influences such as trends over time, geographic variation, or pre-existing differences between participants and non-participants. For such causal questions, experimental approaches are preferred. When experimental approaches are not feasible, high-quality quasi-experiments offer an alternative.

Two: Administrative data and ongoing surveys are important resources, but specialized data collected for the purposes of specific evaluations will also continue to be necessary.
Administrative data and data from ongoing surveys are important resources for learning about program effectiveness and informing program improvement. I am confident that the Commission's recommendations will strengthen the value and availability of these types of data. But specialized data collected for the purposes of specific evaluations will also continue to be necessary, for several reasons:
   a. Some types of information may not be included in ongoing surveys or administrative data. For example, consider measures of young children's socio-emotional or cognitive development.
   b. Administrative data may be available to measure experiences or outcomes of program participants, but typically are not available for comparison groups that don't participate in the programs under study.
   c. Administrative data may lack the quality, completeness, and reliability needed for evaluation purposes.
   d. Data from ongoing surveys may not capture samples adequate for specific populations or for addressing specific program- or policy-related questions.
   e. Administrative data and ongoing surveys are sometimes available only after a considerable time lag.

Three: Easier accessibility and improvements in administrative data would greatly streamline evaluation activities.
We don't typically use the availability of data as a starting point for deciding which questions to pursue. But we do take advantage of existing data sources when we can -- for example, using the National

Directory of New Hires or state Unemployment Insurance records to measure the outcomes of an employment-focused intervention. Easier accessibility of administrative data would greatly streamline our efforts. Particularly when we need to gather data from multiple jurisdictions, the cost, time, and effort of developing agreements and carrying out data exchanges can be comparable to the costs of collecting individual survey data.

Although well-integrated administrative data systems suitable for supporting complex evaluations can take years to develop and require broad-based collaboration across many agencies and levels of government, such systems could reduce costs and time to carry out a range of evaluations. Some specific improvements to make administrative data more useful include adoption of common data semantics and incorporating data elements to better allow data linking.

Four: Implementation and descriptive studies are just as important as impact or outcome evaluations, and relevance is just as important as rigor.
Implementation and impact studies together are especially powerful, allowing us not only to understand whether a program had desired impacts, but also to explore what aspects of the program design or implementation may have enhanced or inhibited those impacts. It is also important to understand the characteristics of relevant populations, and the context, so we can learn which types of services work best for different populations or in different settings. All of these types of work provide critical information for scale-up or replication of evidence-based practices, and for efforts to improve the effectiveness of policies and programs.

Pursuing rigor without attending to relevance can mean producing work that is elegant, but useless. To ensure relevance, we take into account many influences in setting evaluation priorities: statutory requirements and Congressional interests; the interests and needs of executive branch staff and leadership; partners such as states, territories, tribes, and local grantees; the populations served; researchers; and other stakeholders. ACF's evaluation policy calls for planning evaluations in concert with the planning of a program or initiative, rather than as an afterthought. To make sure that evaluations are relevant, we aim to build strong partnerships among evaluation staff, program staff, policy-makers and service providers.

Five: Prerequisites for federal evaluation include statutory authority, funding, a skilled federal workforce, and a robust private sector.
In order to conduct evaluation to inform policy and program decision-making, we must have at a minimum both statutory authority and funding. In addition, we need a skilled federal workforce, and a robust private sector to compete for contracts and grants to carry out the work.

We conduct evaluations in those areas where Congress has provided resources and authority to do so. Several large human services programs at ACF lack both authority and resources for this type of work. Further, most of ACF's funding for evaluation is linked to specific programs, with little funding available for cross-cutting studies, although the individuals and families we serve have complex needs that do not

map neatly onto ACF's programmatic structure. While some agencies (such as the Department of Labor) have broad authority to set aside program funds for evaluation, many agencies do not.

Our evaluation policy states that ACF will recruit and maintain an evaluation workforce with training and experience appropriate for planning and overseeing a rigorous evaluation portfolio. To accomplish this, ACF will recruit staff with advanced degrees and experience in a range of relevant disciplines. ACF will provide professional development opportunities so that staff can keep their skills current. The federal evaluation and statistical workforce is populated by experts whose skills, commitment, and integrity impress me every day.

Private organizations, typically research firms and universities, play an essential role in carrying out federal research and evaluation. We rely on them in part for practical reasons. For one thing, Congress often appropriates funds that can be used for grants and contracts, but not for federal staff. In addition, evaluations require specialized staff of different types at different times. An evaluation may need a large complement of survey interviewers one year, and a small staff of data analysts the next year. It is more practical for the government to contract for these tasks than to carry them out internally. In addition to these practical reasons for conducting work extramurally, this practice adds an important element of independence, another principle of our evaluation policy.

ACF aims to ensure that contractors and grantees conducting evaluations have appropriate expertise through emphasizing the capacity for rigor in requests for proposal and funding opportunity announcements. This emphasis entails specifying expectations in the criteria for the competitive selection of grantees and contractors, and engaging reviewers with evaluation expertise.

Six: Several bureaucratic challenges pose substantial barriers to federal evaluation efforts, including requirements related to procurement, information technology and security, and collection of information.
First, some federal contracting rules are severely constricting. For example, it is difficult to gain approval for awarding a contract longer than five years. But many evaluation questions require more than five years to answer. Even more problematic are prohibitions on incremental funding for non-severable contracts.

Second, there is ambiguity about the application to evaluation of several laws related to data. While there may or may not be clarity in concept, in practice there is often confusion on how to apply the Privacy Act, the Federal IT Acquisition Reform Act, and the Federal Information Security Management Act to evaluation projects. This confusion leads to delays and expense.

Third, information collection for evaluation purposes is subject to the same requirements as any other federal information collection, under the Paperwork Reduction Act. Required public notice periods and review by the OMB Office of Information and Regulatory Affairs take a minimum of 4 months, and often 8 months, or even more. This timeline can make it impossible to evaluate grants that are funded for only a few years; may prohibit the collection of baseline information on program participants; and may

preclude the timely provision of evidence to inform policy or program decision making. While OMB has developed streamlined mechanisms for some limited situations, for the most part the requirements do not differ depending on the size or scope of the information collection. They are the same for a set of interviews with state officials imposing a total burden of 50 hours, and a major survey interviewing thousands of people and imposing thousands of burden hours on respondents.

Seven: The federal evaluation enterprise lacks many elements of the government-wide infrastructure that supports and protects the strength and integrity of the federal statistical system.

1. As one example, data collected by designated federal statistical agencies are covered by the Confidential Information Protection and Statistical Efficiency Act (CIPSEA), whereas data collected by evaluation offices are not.

2. Second, the federal statistical system benefits from a formal structure for exchange of information and ideas across agencies, as well as from a statutorily mandated leadership function at OMB. To support evaluation and the use of evidence, OMB has created an Evidence Team and an Inter-Agency Council on Evaluation Policy, which I co-chair. However, these activities remain limited and largely informal.

3. Third, while ACF and some other agencies have established evaluation policies, there is no government-wide statement of principles for federal evaluation. Just last week the National Academies of Sciences held a workshop to comment on existing evaluation policies of federal agencies as well as the desirability of a cross-agency or government-wide statement of principles. This might follow the model of the NAS publication, *Principles and Practices for Federal Statistical Agencies*.

    ACF's evaluation policy aims to protect the transparency, independence, and objectivity of evaluation, and to insulate evaluation functions from undue influence and from both the appearance and the reality of bias. However without a national infrastructure these protections are somewhat fragile. While some agencies – notably the Department of Education's Institute for Education Sciences – have statutory protections for independence, this is not typical. ACF leadership established our evaluation policy, and future leadership could choose to eliminate it. It would be a shame to lose safeguards such as requirements in our policy to:

    - Make information about planned and ongoing evaluations easily accessible, publish study plans in advance, and release comprehensive evaluation results regardless of the findings.
    - Conduct evaluations through the competitive award of grants and contracts to external experts who are free from conflicts of interest.
    - Place authority with the career director of the Office of Planning, Research and Evaluation to approve the design of evaluation projects and analysis plans; and to approve, release and disseminate evaluation reports.

Conclusion.

The mission of my agency is to foster health and well-being by providing federal leadership, partnership, and resources for the compassionate and effective delivery of human services. Our vision is children, youth, families, individuals and communities who are resilient, safe, healthy, and economically secure. The importance of these goals demands that we continually innovate and improve, and that we evaluate our activities and those of our partners. This is true for other agencies as well.

You have the opportunity to enhance this work. I particularly hope that you will aim your recommendations at furthering the use of data, evidence and evaluation for learning and improvement, rather than primarily for answering yes/no questions that are often of surprisingly little use for these purposes. I look forward to your report. Thank you.

4. Implementation & descriptive studies are just as important as impact or outcome evaluations; relevance is just as important as rigor.

5. Prerequisites for federal evaluation include statutory authority, funding, a skilled federal workforce, and a robust private sector.

6. Several bureaucratic challenges pose substantial barriers to federal evaluation efforts, in the areas of procurement, information technology and security, and information collection.

7. The federal evaluation enterprise lacks many elements of the infrastructure that supports & protects the federal statistical system.

Policy-Driven Demand for Government Evaluation: Data and Capacity Needs
HHS Teen Pregnancy Prevention Program and Key Issues Related to Evaluation

Evelyn Kappeler

Director

Office of Adolescent Health

November 4, 2016

1

OAH Teen Pregnancy Prevention Program

- **Replication of Evidence-Based Programs (Tier 1)** – approx. $75 million annually

- **Research & Demonstration Projects to Develop & Test New and Innovative Approaches (Tier 2)** – approx. $25 million annually

- **TPP Program Support** - approx. $7 million annually

- **Evaluation of TPP Approaches** - approx. $6.8 million annually

2

TPP Evaluation Framework FY2010-FY2014

Office of Adolescent Health (OAH)
Teen Pregnancy Prevention (TPP) Program Evaluation
2010-2015

102 grants

Federal Contract	75 grants	27 grants	Federal Contract*
Teen Pregnancy Prevention Replication Study Evaluation (Tier 1)	Replication of Evidence-based Programs (Tier 1)	Research and Demonstration Projects (Tier 2)	Evaluation of Adolescent Pregnancy Prevention Approaches (PPA) (Tier 2)
3 evaluations	16 evaluations	17 evaluations	5 evaluations

*1 non-federally funded program was included for a total of 6 evaluations

41 TPP evaluations

TPP Evaluation Framework FY2010-FY2014

- Conditions for grantee-led evaluations to maintain high level of rigor:
  - Detail criteria of rigorous evaluation
  - Detailed description in funding opportunity announcement
  - Independent evaluator
  - Sufficient resources
  - Grant conditions and commitment to hold grantees accountable to stated standards
  - Programmatic and evaluation technical assistance

Using Data & Evaluation to Improve Our Work

- Tier 1
  - Replicating evidence-based TPP programs to scale in communities with the greatest need (holistic approach)
  - Capacity building to support replication of evidence-based TPP programs
- Tier 2
  - Rigorous evaluation of new or innovative approaches to prevent teen pregnancy
  - Supporting and enabling early innovation to advance adolescent health and prevent teen pregnancy

5

Continued Investment in Data & Evaluation

- Performance Measures
- Rigorous, Independent Grantee-led Evaluations (Tiers 1 & 2)
- Federal Evaluations
  - Multi-site evaluation study – (1) replications, (2) significant or meaningful adaptations, and (3) selected core components of common programs
  - Qualitative study and rigorous evaluations – the feasibility & impact of scaling up evidence-based programs and taking a holistic approach
  - Implementation & impact evaluation – a commonly implemented but understudied teen pregnancy prevention program
  - Secondary data analysis – interventions for middle school youth
  - Meta-analysis – program/contextual elements that affect outcomes

6

Strategies for Building Evaluation Capacity

- Including a planning, piloting, and readiness period for all grantees
- Implementing programs with fidelity and quality through monitoring
- Incorporating evaluation once program implementation has already begun
- Ensuring strong contrast between treatment control

7

Strategies for Building Evaluation Capacity

- Establishing & promoting uniform evidence standards
- Providing evaluation training & technical assistance
- Collecting and using data to make continuous quality improvements
- Disseminating all evaluation results transparently and expanding the evidence

Commission on Evidence-Based Policymaking

Washington, DC – November 4, 2016

2

Cities are in a unique position to pursue evidence-based policymaking and foster innovation.

Cities are **closer to problems and to the people affected** – which makes them better able to innovate.

- Responsible for design, delivery and execution of services
- Receive immediate feedback from residents who viscerally experience their engagement with local government

Cities are both the **creators and consumers of evidence**.

- Provide funding and real-world data for research
- Use evaluation to inform effective policy making that ensures accountability

NYC
Mayor's Office of Operations

3

The Center for Economic Opportunity (CEO) helps New York City government reduce poverty by advancing the use of evidence and data in program and policy design, service delivery, and budget decisions.

	Research		Design		Program Management
	Evaluation		Data Integration		Digital Products

- **Poverty Measure**: produces an annual NYC CEO Poverty Measure
- **Innovation Fund**: designs and oversees ~ $85 million portfolio of ongoing early-stage program models
- **Evaluation**: manages evaluations using 8 outside firms
    - o Examples of past CEO evaluations that have led to large-scale change include:
        - o CUNY ASAP
        - o Jobs Plus
        - o Sector-focused workforce initiatives

NYC
Mayor's Office of Operations

4

NYC is already using administrative data to improve citywide services and outcomes for New Yorkers.

- **Citywide Data Integration** is the commitment to making data accessible for data sharing among multiple agencies.

- **Worker Connect** enhances the ability of front-line staff to access client information held by different agencies.

- **Common Metrics Initiative** seeks to create uniform metrics across funding streams and city agencies to make relative comparisons of programs possible.

Recommendations: Continue to build on existing, effective strategies at the federal level.

1. **Encourage more federal funding to be allocated to evidence-based strategies** and to grantees who are committed to building evidence through programs.

2. **Continue developing federal Common Metrics** to ensure everyone can make relative assessments and direct funds to the most effective programming to make funding allocations more impactful.

3. **Amend federal laws to give local governments more freedom to share client data** among its own divisions and employees.

   a) Amend HIPAA regulations to create a new legal exception that clearly authorizes city agencies to share information with each other, without requiring client consent, when providing or coordinating benefits, services, and care.

   b) Clarify additional ways consistent with the Family Educational Rights and Privacy Act that cities can engage in outreach and support to vulnerable students.

   c) Update privacy related laws and regulations to accommodate the application of technology used to support data integration.

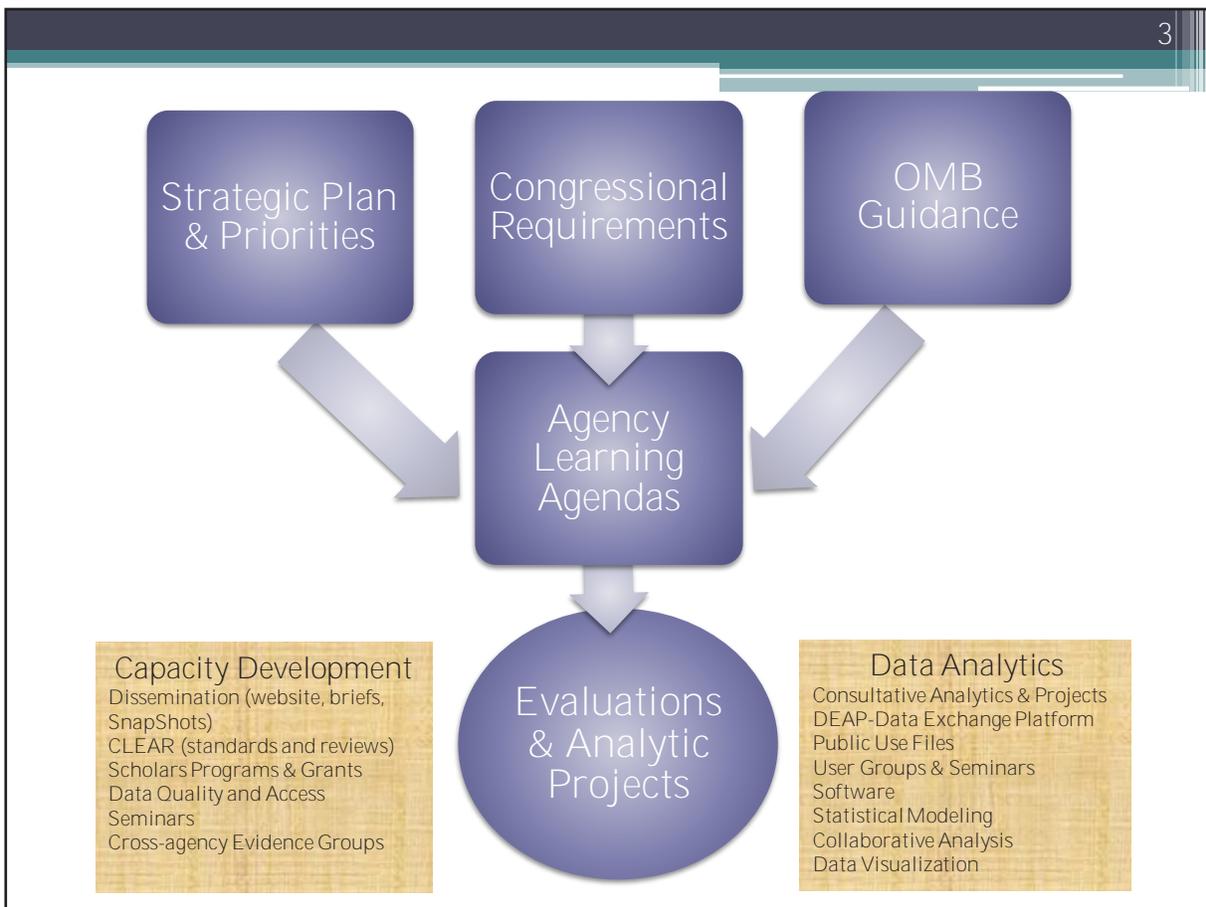
Evidence-based Policy: A Federal Evaluation Office's Perspective

Demetra Smith Nightingale
Chief Evaluation Officer
U.S. Department of Labor

Presentation to the
Evidence-based Policy Commission
November 4, 2016

2

DOL Mission

- "...foster, promote, and develop the welfare of the wage earners, job seekers, and retirees of the United States; improve working conditions; advance opportunities for profitable employment; and assure work-related benefits and rights"
  - Over a dozen operating agencies, each with subagencies, many programs, and field offices
    - Worker protection and labor standards
    - Employment services, job training, and worker security
    - Policy and advocacy
    - Many have research, analysis, and/or evaluation offices
- CEO's Departmental-level evaluation support-
  - Complements not duplicates agency evaluation functions
  - Raises the quality of evaluations and awareness and knowledge of evaluation methodology and standards
  - Improves use and dissemination of evaluation results
  - Improves access to, quality of, and use of data, including the CEO Data Analytics Unit (coordinate with BLS, Performance Management Center, and agencies)


Main Types of Evaluations

- Formal evaluations
  - Experimental design—random assignment treatment and control groups (especially formal net impact evaluations, rapid cycle behavioral tests)
  - Quasi-experimental designs—created comparison groups (statistical matching techniques)
  - Various analytic levels: nation, states, localities, grantees; programs, demonstrations, strategies, models
- Outcome evaluations
  - Nonexperimental statistical/econometric modeling
  - Survey analysis
  - Statistical analysis of BLS and Census data
- Program performance analysis
  - Quantitative output and outcome analysis
- Implementation and management evaluations
  - Organizational and program process analysis

5

Priority Data Issues for Evaluations

- Appropriate outcome variables
  - (e.g., individual workers, program participants, firms, establishments, states)
- Appropriate independent variables, covariates
  - (e.g., labor market conditions, demographic and household characteristics, work and earnings history, education, criminal record, occupation/industry, compliance history)
- Time frame aligned to evaluation goals—pre and post periods
- Micro-level data
- Longitudinal features
- Agile merging
  - Longitudinal analysis files
  - Using unique identifiers (e.g., individuals, firms, establishments, states, programs, grantees)
  - Linking other evaluation data collected (e.g., surveys, program data)

6

Priority data systems issues for evaluations

- Analysts' access to the physical data infrastructure (e.g., by third-party researchers, federal staff analysts)
- Expert human capital (e.g., data and programming expertise)
- Timeliness of access
- Security (e.g., secure PII, informed consent usage)
- Cost efficient

7

Priority interests ("wish list") to improve data for DOL evaluations

- *Earnings data.* Direct, and less costly, access to earnings records produced by DOL's state employment security agency partners—for evaluation, statistical products, and program performance measurement
  - National Directory of New Hires
  - Longitudinal Employer and Household Dynamics
- *Firm identifiers.* Common firm, employer, and establishment identification scheme
- *Reformed PRA.* Streamlined and less costly Paperwork Reduction Act (PRA) process for evaluations and evidence-building
- *Streamlined IAA.* Less cumbersome interagency agreement (IAA) process to facilitate and encourage cross-agency data sharing and matching at the Federal level
- *Privacy & Security.* More clarity and consistency in procedures and rules among Federal agencies and other data providers

Testimony to the Commission on Evidence-Based Policymaking
"Policy-Driven Demand for Government Evaluation: Data and Capacity"

Submitted by: Katherine O'Regan, Assistant Secretary for Policy Development & Research, Department of Housing and Urban Development
November 4, 2016

A. Importance of the Commission's work

Good afternoon and thank you Commissioners for the invitation to join you today, to talk about data and capacity issues in government evaluation. Collecting, analyzing and using data and research to inform HUD's programs and policies is at the core function of my office, the Office of Policy Development and Research. Like many other Federal agencies, HUD has been focused on learning more from the data we collect, and the research we conduct.

We believe that to make the most of government data and fully leverage how these data can inform policy, we need a leap forward:

- by making our administrative data much more widely available while protecting privacy;
- by matching them to other data – across government agencies, across levels of government, and non-governmental data, which is particularly key to expanding cross-domain knowledge; and
- By ensuring the capacity of governmental agencies to leverage linked government data to conduct in-house research.

We have access to our own administrative data but have both internal and external gaps.

- Internal needs include the staff time and capacity to do the research internally - with better infrastructure to support them, to ensure data privacy protections, and to more easily permit linking to data external to the agency.
- External needs include the ability to get outside researchers' access to our data and, similarly, the infrastructure to support them, ensure data security, and enable linking.

The Evidence Commission's charge, and recommendations, could create that leap forward, greatly improving the use of Federal data in building evidence for policy. I will start by providing some background on an area we have focused considerable effort.

B. Cross-Agency Data Linking

HUD has initiated several cross-agency data linking efforts to better understand non-housing domains of HUD assisted households, and to support evaluation work. I will focus on two efforts in particular, and some lessons learned.

1. Department of Education, Free Application for Federal Student Aid (FAFSA).
   This year, HUD and the Department of Education (ED) signed an MOU that allows HUD to provide ED with data on assisted tenants for matching to Federal Student Aid data.

   Benefits
   We are using the used the linked data to learn about application for and receipt of Federal Student Aid among tenants, **and** to conduct some rapid-cycle experiments, aimed at increasing FAFSA take up and college enrollment.
   - For the first time, HUD has national data on one measure of college attendance for those we serve.
   - We are able to conduct rapid-cycle, in-house experiments.

- We are also able to provide aggregated data to Public Housing Agencies (PHAs) on the FAFSA take up for their assisted households, <u>which some will use to evaluate their programmatic efforts – for the first time</u>.

Lessons
- Those linked-data, however, do not sit in a secured research center with access for HUD or ED staff.
- *Lack of infrastructure inhibits easy in-house work, or for getting more out of the matches.*

2. <u>HUD-National Center for Health Statistics (NCHS) linked data.</u>
The second example is work with the National Center for Health Statistics, linking HUD longitudinal administrative data on assisted households to 14 years of cross-sectional health survey data from two national surveys (*National Health Interview Survey (NHIS); National Health and Nutrition Examination Survey (NHANES)*).

Benefits
The linked data files enable researchers to examine the relationship between assisted housing and factors that influence health status, chronic disease, health care utilization, morbidity, and mortality. Benchmarking data and research have already been produced.

Lessons
- The existence of the CDC research center, with *appropriate infrastructure for linking and for handling privacy* was fundamental to the work.
- The MOU process allowed both agencies to conduct the linkage cost-free, and the interagency MOU underwrote free RDC access for HUD researchers, a significant cost barrier reduction.
  - *Sustainable financial models for data sharing need to be built in to such work.*
- Legal barriers due to data privacy concerns were very challenging.
  - Establishing the MOU between agencies took many years to negotiate.
  - *This project moved forward due solely to the prolonged commitment of a handful of staff.*
  - *As we continue down this path, <u>a more centralized approach is much more efficient.</u>*

<u>Across both experiences, these one-off, time consuming interagency matches are not the most efficient way to exploit data and are difficult to sustain.</u> This has led to our most recent effort.

C. HUD MOUs with the Census Bureau

HUD has entered into two agreements with Census to greatly broaden access to HUD data and matching with non-HUD data for approved <u>internal</u> and <u>external</u> researchers, within Census's Controlled Access Infrastructure.[1]

1. <u>The first is an Inter-Agency Agreement (IAA)</u> with the <u>Center for Administrative Records Research and Applications (CARRA)</u> to link data from HUD's tenant databases and select randomized control trials with the Census' survey data collection and other administrative data.
  - HUD's tenant databases are already maintained within CARRA, which permit outside researchers to gain access via a secured Federal Statistical Research Data Center.

---

[1] Census has the infrastructure to support IT security requirements for research with PII and other highly sensitive data. As part of the infrastructure support, Census provides disclosure reviews and research assistance to authorized researchers with approved research projects.

- Via this IAA, HUD has sent the Moving to Opportunity (MTO) data to CARRA (the HUD voucher demonstration that Raj Chetty and co-authors linked to IRS data);
  - In FY2017, we plan to send the Family Options Study (FOS) data to CARRA.
- To jumpstart research projects, HUD will issue a solicitation for research using these data linked with other administrative data – all accessed through the Federal Statistical Research Centers that are the portal to CARRA.

Benefits
As you all know, and will be learning more about at upcoming convenings, OMB directed the Census Bureau to use appropriated funds for these purposes, and to administer the Evidence-Based Policymaking Commission.[2]
- Our agreement with Census is the first Federal effort (a 'pilot') in a larger expansion of Census's data linkage infrastructure to support evidence-building and program evaluation.
- Our IAA and data sharing with Census will greatly increase external researchers access to HUD administrative and research data, within a secured infrastructure.

Lessons
While this pilot has just started, and we believe it holds the promise for how best to proceed with cross agency data matching, and making the most of archived research studies, we also believe:
- A sustainable cost structure will need to be developed for a broad group of Federal agencies to use this model.
- For context, the current pilot costs $50,000 per evaluation data set, *per year*, with potentially additional costs per researcher.
  - The longer-term costs need a model that does not consume agencies' current research budget.

2. HUD and Census have also signed a Joint Statistical Project Agreement (JSPA) that will commit HUD and Census to partner on linking housing data to non-housing data sources already acquired by Census, to be available for internal researchers at each agency.

Benefits
- HUD staff working on these projects are able to access the data linked via CARRA remotely from a secured computing environment within PD&R/HUD, for much faster policy/evaluation work.

Lessons
- *Providing Federal staff with access to linked administrative data, those with program knowledge and the ability to move evidence much more quickly into policy is a critical piece of driving evidence-based policy.*

An additional lesson on the benefits of linked data in CARRA has already occurred on the interplay between data availability and what we study. PD&R is conducting our research-agenda setting process, one that engages with stakeholders internally at HUD, and much more broadly. As we winnow down the more than 500 submissions, some 'big questions' that might not have been asked - or small ones that might not have been prioritized – will be included in our Strategic Plan because, through data matching with the Census, we considered the research feasible. *The existence of a way to evaluate/study something does affect whether we prioritize it in our research agenda.*

---

[2] Evidence-Based Policymaking Commission Act of 2016

As we move towards establishing a clearinghouse for Federal data, such as CARRA, there are ways to make the most of those data.

D. Making the most of data within CARRA

1. Institutional Review Board guidance to permit indefinite data matching at CARRA

The recent work from Raj Chetty has brought attention to the benefits of data matching, and specifically to HUD's Moving to Work or MTO demonstration of the 1990s. In that study, HUD received consent from 4,610 families to conduct data matching against administrative records.
- The consent <u>was not time restricted</u> and <u>it was general</u> about the types of administrative data for the matching.
- This has allowed HUD to track the impact on the heads of households and their children for nearly two decades. It permitted the long term impact work of Raj Chetty. And it is allowing the MTO data to be made available at CARRA to measure impacts over even more years.

HUD's Family Options study, a randomized study to measure the benefits of receiving long-term versus short-term housing assistance for families with children who are homeless<u>, also has research questions that extend out 20 years or longer.</u> However, the IRB for this study limited the consent to 5 years.
- Although HUD will be providing these data to CARRA, the limited consent period applies.

Lesson
- It is reasonable to limit the time frame for consent for generic administrative matching.
- But if research data are eventually protected by the Census Bureau Title XIII, as part of the Federal clearinghouse, <u>we are proposing that IRBs be given model language to allow indefinite consent under those conditions.</u>
- When impacts take 20 or 30 years to materialize, we need to be sure that we will be able to measure them.

2. <u>State data.</u>
Demonstrations and evaluations take place in a limited number of locations, and non-Federal administrative data is frequency crucial to many studies. There are many obstacles to accessing –and linking- those data too.

- In the long term evaluation of the Moving to Opportunity demonstration, researchers sought administrative data from multiple states on wages from unemployment insurance programs and on various benefits (TANF and SNAP).
- Data access varied considerably from state to state, with some states providing only aggregate data which limited HUD's ability to look at program impacts for specific subgroups. <u>For one state, we are still working on securing needed data</u>.
  - Note, some of the need to link state data is itself occurring after failure to get agreement on linking across Federal agencies for (in this case, Medicaid data).

Lessons
Consider the role of Non-Federal administrative data in your review
- Census has initiated a pilot with Chapin Hall, bringing in a limited set of state and local data into CARRA, as a proof of concept. This could be expanded.
- Any data inventory the Commission creates should include non-Federal data.

E. Additional Issues for the Commission's Consideration

1. <u>Gathering data and the Paperwork Reduction Act</u>

The Paperwork Reduction Act (PRA) requires that for any data collection involving 9 or more individuals or organizations, the data collection needs to go through a formal process of review that involves both a 60-day public notice in the Federal Register seeking comment to the agency and an additional 30-day notice for the public to provide comment to OMB. HUD's experience is that clearances take between 120 to 180 days, so for most questions**, it is 4 to 8 months before data collection can begin.**

PRA is an effective tool for reducing burden by preventing *unnecessary* data collection from the public. But the length of time to complete the process may also be inhibiting useful data collections that could improve policies and programs, and those sub-optimal policies may impose also impose severe burden on the public.

This is particularly relevant for HUD, which does not operate its programs directly. Instead it provides funding to local organizations to implement its programs. These organizations include Public Housing Agencies (3,400), state and local governments (1,200), lenders (several hundred), multifamily-owners of assisted properties (20,000), and non-profit homeless providers (10,000 or so).

Sometimes it is critical to get new information from these organizations to address an un-foreseen issue. PRA prevents collecting this information in a timely manner beyond nine of these organizations. If these programs were operated by Federal government employees directly we would not be prevented from collecting this information. As a result, it is not uncommon that HUD makes policy decisions and program changes with very little information; often reacting to anecdote rather than a more complete picture.

 Lessons
- More robust incorporation of data and evidence in Federal policy requires improvements in PRA. There are various ways this could be done.

As one example: allow 30-day agency reviews without OMB engagement on collections below some thresholds, such as 1,000 responses and under 500 burden hours. This would take a 90 to 180-day process for these collections and turn them into 30 day processes.

There are numerous other suggestions that this commission would likely hear across Federal agencies, along a similar vein.

2. <u>Address weakness of Privacy Act Protections</u>
In a recent Freedom of Information Act (FOIA) case[3], a Federal district court ordered HUD to release to the requester <u>the individual records</u> of tens of thousands of voucher-assisted tenants, omitting the most obvious identifying variables (name, SSN, address) but including zip code, census tract, age of all household members, race of head, and a wide variety of other data that in HUD's view could be used to identify households receiving HUD assistance.

---

[3] "The Inclusive Communities Project, Inc. v. The United States Department of Housing and Urban Development," Civil Action No. 3:14-CV-3333-B

This was possible because the HUD administrative records, and records of many other agencies, are protected from disclosure only under the Privacy Act.

- Under FOIA, when records have only Privacy Act protection, the onus is on the government to prove the probability of harmful disclosure. In this particular case, the court felt HUD had not met the burden of proof, and presumably other courts might come to the same conclusion.
- The individuals whose lives are captured in the administrative and survey data that HUD uses for evaluation and analysis are therefore vulnerable in a way that they would not be if these data had the statutory protections that Census data, income tax data, or Medicare data have.
- HUD is concerned that the quality of administrative data may decline, if some individuals will eventually be less inclined to give honest answers to the questions we ask, or may decline to cooperate at all, if they may subsequently become subject to public exposure.

Lesson
- The Commission should consider recommending strengthening in statutory protection for administrative and survey data collected for agencies like HUD.

F. Conclusion

We appreciate the chance to provide these comments to the Commission, and the forthcoming conversations on data and capacity issues in support of government evaluation and policy needs.

Policy-Driven Demand for Government Evaluation: Data and Capacity

Commission on Evidence-Based Policymaking

Katherine O'Regan

Assistant Secretary
Office of Policy Development and Research
Department of Housing and Urban Development

November 4, 2016

PD&R

U.S. Department of Housing and Urban Development | Office of Policy Development and Research

Cross-Agency Data Linking:
Free Application for Federal Student Aid (FASFA)

- HUD provides ED assisted tenant data for matching to Federal Student Aid data.

- Benefits

    - HUD now has national data on one measure of college attendance.

    - Able to conduct rapid-cycle, in-house experiments.

    - Provide aggregated data to PHAs on take up for assisted households.

- Lessons

    - Linked data not located in secured research center with access for HUD or ED staff.

    - *Lack of infrastructure for easy in-house work, or for getting more out of the matches.*

PD&R

2

U.S. Department of Housing and Urban Development | Office of Policy Development and Research

Cross-Agency Data Linking:
HUD & National Center for Health Statistics

- 14 years of HUD data (1996-2014) linked to cross-sectional health survey data.

- Benefits

  - Enables researchers to examine the relationship between assisted housing and factors that influence health status, chronic disease, health care utilization, morbidity, and mortality.

- Lessons

  - CDC research center (linking, securing privacy) is fundamental to supporting work.

  - MOU included cost-free linkage, free RDC access for HUD researchers.

  - Legal barriers due to data privacy concerns were very challenging; MOU took years to negotiate.

- Across both projects: time-consuming, one-off MOUs not the best way forward.

PD&R

3

U.S. Department of Housing and Urban Development | Office of Policy Development and Research

Census MOUs:
IAA with CARRA

- Center for Administrative Records Research and Applications (CARRA) IAA to link data from HUD's tenant databases and select trials with Census' survey data and other administrative data.

- Benefits

  - OMB directed Census to use appropriated funds for these purposes and to administer the Evidence-Based Policymaking Commission.

  - Pilot to support evidence-building and program evaluation.

  - Will greatly increase external researchers' access to HUD administrative and research data, within a secured infrastructure.

- Lessons

  - A sustainable cost structure will need to be developed for broad adoption.

    - *Longer-term costs need a model that does not consume agencies' current research budget.*

PD&R

4

U.S. Department of Housing and Urban Development | Office of Policy Development and Research

Census MOUs:
Joint Statistical Project Agreement

- Joint Statistical Project Agreement (JSPA) commits HUD and Census to partner on linking housing data to non-housing data sources, available for internal researchers at each agency.

- Benefits

  - HUD staff can access linked data remotely from a secured computing environment within PD&R/HUD, for much faster policy/evaluation work.

- Lessons

  - Providing federal research staff access to broad administrative data is a critical piece of driving evidence-based policy.

- Additional Lesson

  - The interplay between data availability and what we study.

    - CARRA linking is already affecting our research agenda.

PD&R

5

U.S. Department of Housing and Urban Development | Office of Policy Development and Research

Making the Most of Data within CARRA

1. Institutional Review Board guidance to permit indefinite data matching at CARRA.
   - MTO data: consent not time restricted, general administrative matching.
   - Family Options Data: 5 year consent.
- Lessons
  - It is reasonable to limit the time frame for consent for generic administrative matching.
  - But if the responses are protected by the Census Bureau Title XIII, we are proposing that IRBs be given model language to allow indefinite consent.
    - When impacts take 20 or 30 years to materialize, we need to be sure that we will be able to measure them.

PD&R

6

U.S. Department of Housing and Urban Development | Office of Policy Development and Research

Making the Most of Data within CARRA

2. State Data

- Non-Federal administrative data is crucial to many studies. State data access varies widely.

- Lessons

  - Consider the role of non-Federal administrative data

    - Chapin Hall pilot, whereby state and local data are being added to CARRA, should be expanded.

    - Any data inventory the Commission creates should include non-Federal data.

Additional Issues to Consider

1. Gathering data and the Paperwork Reduction Act.

- More robust incorporation of data and evidence in Federal policy requires improvements in PRA.

  - Particularly important for HUD – which does not operate its programs directly (Public Housing Agencies = 3,400); state and local governments (1,200); multifamily-owners of assisted properties (20,000); etc.

  - There are various ways this could be done.

2. Weakness of Privacy Act Protections.

- Administrative data on which much of these efforts will be built has fairly weak privacy protections under the Privacy Act.

- The Commission could consider recommending strengthening statutory protection for administrative and survey data collected for agencies like HUD.

NON-PROFIT SERVICE PROVIDERS AND EVIDENCE-BASED POLICY

NON-PROFIT SERVICE PROVIDERS

- ➢ $200 BILLION PER YEAR SPENT BY PRIVATE SOCIAL SERVICE PROVIDERS

- ➢ PROGRAMS TYPICALLY MONITOR OUTPUTS; RARELY MEASURE IMPACT

- ➢ EVIDENCE OF PROGRAM IMPACT IN THIS SECTOR IS NECESSARY FOR PROMOTING EVIDENCE-BASED POLICIES AND PROGRAMS NATIONALLY

CHALLENGES (FOR PROVIDERS)

- ➢ FUNDING IS NOT ALIGNED WITH MEASURING IMPACT

  Most private and government funding for private providers does not require impact measurement, and consequently limited resources are available to build a body of evidence of what works.

- ➢ ACCESS TO DATA AND ANALYSIS IS LIMITED

  Social service providers collect the necessary data for eligibility and for reporting, but lack access to administrative data to measure outcomes and the bandwidth to analyze it.

- ➢ NOT CONNECTED TO EVIDENCE OF WHAT WORKS

  Providers looking to start a new, evidence-based program often have a difficult time finding information on validated programs and how to implement them.

RECOMMENDATIONS (FOR COMMISSION)

- ➢ **INCENTIVIZE IMPACT EVALUATION**

  Funding for private service provider programs should require rigorous evaluation AND include appropriate funding to pay for it so providers can measure impact, but not cut into scarce program budget resources to do so.

- ➢ **PROVIDE ACCESS TO ADMINISTRATIVE DATA**

  Providers need access to the administrative data sets that include key outcomes such as earnings records, government program participation (e.g. TANF, SNAP, SSDI), hospitalizations and health care utilization, arrest records and education records.

- ➢ **CREATE A WHAT WORKS CLEARINGHOUSE**

  Make the best evidence available and easily accessible so that impactful programs are widely known and can be replicated throughout the private service provider sector.

WILSON SHEEHAN
LAB FOR ECONOMIC
OPPORTUNITIES

REDUCING POVERTY AND IMPROVING LIVES
THROUGH EVIDENCE-BASED PROGRAMS AND POLICIES

EXAMPLES OF LEO'S WORK WITH NON-PROFIT SERVICE PROVIDERS USING ADMINISTRATIVE DATA

EXAMPLE 1: HOMELESSNESS PREVENTION

PROGRAM: The Homelessness Prevention Call Center (HPCC) in Chicago is one of the largest call centers in the nation, taking approximately 70,000 calls each year. The HPCC connects those at risk of homelessness with emergency financial assistance, but the availability of funding varies unpredictably on a day-to-day basis.

STUDY AND DATA: LEO'S study examines the impact of financial assistance for 4,500 individuals and families who called the HPCC between 2010 and 2012. In order to observe shelter entry for these callers, we linked the call center information to administrative data on entries into and exits from homeless shelters in Chicago.

RESULTS: Emergency financial assistance prevents homelessness.
- Assistance reduced shelter entry 6 months after the call by 76 percent; effect persists for more than a year.
- Impact of financial assistance is largest for those with especially low income.

EXAMPLE 2: JUVENILE DIVERSION

PROGRAM: Reading for Life (RFL) is a diversion program in St. Joseph County, Indiana designed for non-violent juvenile offenders. A unique and innovative alternative to prosecution in the court system, RFL allows participants to study works of literature in small groups led by trained volunteer mentors.

STUDY AND DATA: LEO's study examines the impact of RFL for 400 first time juvenile offenders randomly placed into RFL or into community service diversion between 2010 and 2014. In order to measure recidivism, we linked RFL enrollment data with administrative data collected by the Juvenile Justice Center and adult arrest records collected by the State.

RESULTS: The Reading for Life diversion program reduces two-year recidivism rates for prosecuted felonies by 50%.
- Participants were 36% less likely to be arrested
- Participants were 68% less likely to be prosecuted for a felony

The **Wilson Sheehan Lab for Economic Opportunities (LEO)** is a research lab housed in the Department of Economics at the University of Notre Dame. LEO matches top researchers with social service providers to conduct impact evaluations that identify the innovative, effective, and scalable programs and policies that support self-sufficiency. LEO's research is conducted by Notre Dame faculty as well as an interdisciplinary network of scholars from across the country with expertise in designing and evaluating the impact of domestic programs aimed at reducing poverty and improving lives. LEO disseminates its key findings to policymakers and front-line providers in order to support evidence-based policy and programming decisions that effectively and jointly reduce poverty in the United States.

Releasing Machine Readable Data – Provider Payment and Utilization Files

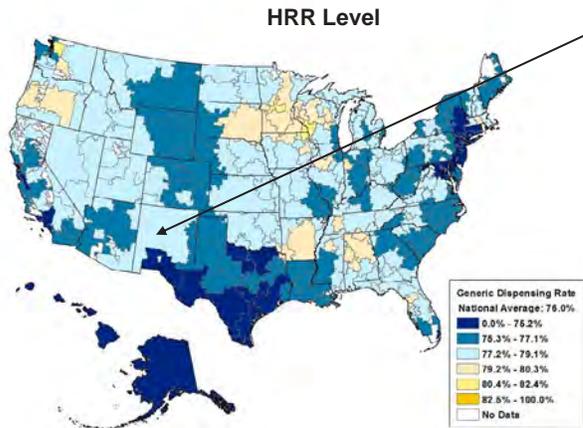
- Public data sets with payment and utilization information for services and procedures provided to Medicare beneficiaries
- Data released to date covers > 85% of Medicare program payments

May 2013	April 2014	April 2015	Oct 2015	Dec 2015	Mar 2016	Oct 2016
Hospital Inpatient & Outpatient	Physician & Other Supplier*	Part D Prescriber	DME and POS	Home Health Agency	Skilled Nursing Facility	Hospice
• 3,000 Hospitals	• 880,000 NPIs	• Over 1M NPIs	• 385,000 NPIs	• 11,000 HHAs	• 15,000 SNFs	• 4,000 Hospices
• 150,000 records	• 9M records	• 23M records	• 1.9M records	• 100,000 records	• 80,000 records	• 4,000 records
• $62B in payments	• $90B in payments	• $103B in drug costs	• $11B in payments	• $18B in payments	• $28B in payments	• $15B in payments

*Updated to include demographic and health information associated with the provider's beneficiary panel in **October 2015**

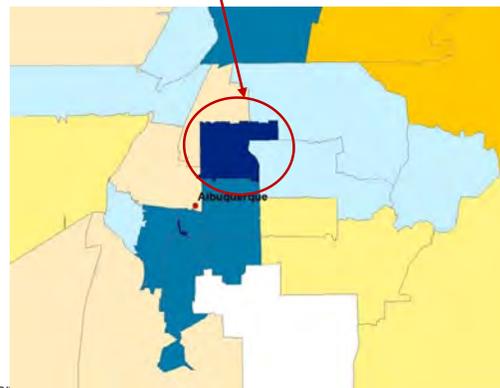
4

Medicare Part D Generic Dispensing Rate

HRR Level


The national average for dispensing generic drugs is 76.0%. NM's state average (77.2%) is slightly higher.

ZIP-code 87109
(Albuquerque)
= 71.5%

Generic Dispensing Rate
National Average: 76.0%
- 0.0% - 75.2%
- 75.3% - 77.1%
- 77.2% - 79.1%
- 79.2% - 80.3%
- 80.4% - 82.4%
- 82.5% - 100.0%
- No Data


Across NM ZIP-codes, generic dispensing rates range from 0% to 100%. One-third of NM ZIP-codes have rates below the state average.

5

Part D Prescribers in Albuquerque (ZIP-code 87109)

Albuquerque, NM: ZIP 87109
545 Providers, Average GDR = 71.5%

Provider Name	Provider Specialty	Drug Claims	Generic Drug Claims	Generic Drug Dispensing Rate
A. Weinstein	Ophthalmology	4,834	594	12.3%
J. Dorf	Pulmonary Disease	2,963	515	17.4%
T. Watterberg	Ophthalmology	2,123	433	20.4%
V. Valentine	Clinical Nurse Specialist	1,078	348	32.3%
R. Allen	Ophthalmology	1,713	619	36.1%
J. Krawchuck	Nurse Practitioner	1,371	604	44.1%
B. Monson	Ophthalmology	1,096	521	47.5%
R. Patel-Trujillo	Internal Medicine	1,757	877	49.9%

These 8 providers all have at least 1,000 total drug claims and a generic drug dispensing rate (GDR) < 50%.

The most prescribed brand name drug by this provider is Vigamox, which accounted for 34.2% of his total claims ($188,354)

6

Building Consumer Friendly Interfaces

7

Enabling Cutting Edge Health Care Research

- ***Research Data Assistance Center (ResDAC)*** provides assistance to researchers interested in using Medicare and/or Medicaid data
- The ***Chronic Condition Warehouse (CCW)*** is CMS' research data warehouse designed to support external researchers and internal CMS research and analytic functions
  - Contains over 315B records with 1B records added monthly
  - Unique beneficiary ID allows data linkages across all CCW data
- New innovator research data access expands current data release policy to allow innovators to access CMS data to create products they intend to sell

8

Available Research Data Files

- Medicare enrollment and claims (1999-current)
- Medicare Part D event data (2006-current)
- Medicaid eligibility and claims (1999-2013)
- Assessment data (instrument inception-current):
  - Long Term Care Minimum Data Set (MDS)
  - Home Health Outcome and Assessment Information Set (OASIS)
  - Inpatient Rehab Facility – Patient Assessment Instrument (IRF-PAI)
- Shared Savings Program and Pioneer ACO files (2013-current)
- Medicare Data on Provider Practice and Specialty (2008-current)
- Administrative data linked to surveys (e.g., Health and Retirement Survey, National Health and Aging Trends Study)

9

Types of Research Data Files

- CMS makes two types of files available to researchers
  - Limited Data Set (LDS) files which excludes specific direct identifiers, including name, address, HIC, SSN, DOB, ZIP Code and medical record number
  - Research Identifiable Files (RIFs) which are custom CMS data extracts that may contain direct beneficiary identifiers
- LDS files are easier to request (less documentation and CMS review) but users face additional limitations on use of the data

	Research Identifiable	Limited Data Sets
Requires CMS Privacy Board Review?	Yes	No
Data file can be customized to only include a specific cohort (e.g., diabetics residing in MN)	Yes	No
Data can be linked to non-CMS data using a beneficiary identifier (SSN or Medicare id)	Yes	No

10

Virtual Research Data Center (VRDC)

- Researchers have been receiving CMS data for decades
  - Requests have grown exponentially over the past couple years
  - Researchers are requesting more timely and less expensive data
- CMS developed the VRDC to meet researchers evolving needs
- VRDC is a secure and efficient means for researchers to virtually access and analyze the vast store of CMS data in the CCW
- VRDC benefits
  - Lower cost, more timely data
  - Researchers use own laptop to securely access and analyze data remotely
  - Increased security for sensitive data
  - Additional privacy protections – no beneficiary identifiable data may leave the secure environment

The CMS Virtual Research Data Center (VRDC) is an alternative solution for accessing and analyzing CMS data for research purposes. To learn more about getting data for your research, view the CMS VRDC FAQs and visit the ResDAC website.

11

BLS Federal-state cooperative program:
Quarterly Census of Employment and Wages

Erica L. Groshen
Commissioner
Bureau of Labor Statistics

Commission on Evidence-Based Policymaking
December 12, 2016

1 — U.S. BUREAU OF LABOR STATISTICS • bls.gov

Agenda

- QCEW general background
- Data acquisition
- Quality and curation
- Linking
- Uses and analysis
- Sustainable, scalable, matchable
- Archiving

2 — U.S. BUREAU OF LABOR STATISTICS • bls.gov

QCEW general background

- **Essential economic information**
  - ▶ Number of establishments
  - ▶ Monthly employment
  - ▶ Total and average wages
- **Issued quarterly (frequent)**
  - ▶ Available 6 months after quarter ends
- **Published detail**
  - ▶ Nation, states, MSAs and counties
  - ▶ By 6-digit NAICS industry
- **Covers 96.5% of civilian employees**
  - ▶ U.S., Puerto Rico and U.S. Virgin Islands

3 — U.S. Bureau of Labor Statistics • bls.gov

BLS

Data acquisition

- **Fed-state cooperative program**
  - ▶ BLS provides funding, training, IT system, quality standards, processing, analysis, enhancements
    - – $58 million in FY2016; over half goes to states
    - – 100 BLS and 300+ state employees
  - ▶ State LMI agencies prepare and provide quarterly UI tax micro data
    - – Establishment-level
    - – Within 15 weeks
  - ▶ Shared governance council (BLOC)

4 — U.S. Bureau of Labor Statistics • bls.gov

BLS

Quality and curation

- Working together to ensure gold-standard data
  - ▶ Acquiring
  - ▶ Transforming
  - ▶ Reviewing and editing
  - ▶ Processing
- Data enhancements
  - ▶ Annual Refiling Survey
  - ▶ Multiple Worksite Report
  - ▶ Linking…

Linking

- Establishments linked across quarters to create longitudinal records
  - ▶ Sampling frame for BLS establishment surveys
  - ▶ Input to Local Area Unemployment Statistics
  - ▶ Source of Business Employment Dynamics (BED) and new variables
    - – Births, deaths, expansions, contractions
    - – Age, survival rates, firm size

Uses and analysis

■ An example of high-quality data BLS provides to inform smart, evidence-based decisions

Uses and analysis – cont'd.

■ QCEW's strong, wide user base
  ▶ Bureau of Economic Analysis
  ▶ Census Bureau
  ▶ Outside researchers—top ranked
  ▶ Programmatic
    – Employment and Training Administration
    – State and local government
  ▶ Private sector
    – Modeling and weighting big data
    – Sales plans and location decisions
    – Forecasts

Map of QCEW uses

BLS Publications
- **QCEW:** Quarterly Releases: County by detailed NAICS - 5 month lag
- Annual Employment and Wages
- Special publications/maps

BED: Job Creation/Destruction
- Quarterly and Annual
- Size Class Dynamics
- Firm and establishment births/ deaths
- Business Survival Rates
- Monthly Labor Review

Census Bureau Uses of QCEW
- **LEHD:** QCEW is essential matching key and source of geography and industry and link to other datasets, and employment
- **Business Register:** Sharing to reduce costs, burden and improve consistency
  Industry Code Sharing (3 Million/year)
- **COS:** Mullti-unit sharing- reduces cost and improves consistency
- **CPS Redesign:** QCEW used after decennial Census to improve sample design

State and Local Government
- Services Planning
- Transportation planning
- Emergency planning

Economic Development Indicators
- Cluster Analysis
- Shift Share
- Industry Diversity Indexes
- Location Quotients
- Local Impact analysis
- Site planning decisions

Gross Domestic Product (BEA)

Personal Income (BEA) Largest single input

State Revenue Projections

Economic Forecasting

General Economic Uses

Current Employment Statistics

Occupational Employment Statistics

Occupational Safety and Health Statistics

Jobs Openings & Labor Turnover Survey

Benchmarking (Employment Base)

Analytical Uses

Quarterly Census of Employment and Wages (QCEW)

Sampling

Industrial Price Program

National Compensation Survey

Current Employment Statistics

Occupational Employment Statistics

Occupational Safety and Health Statistics

Job Openings & Labor Turnover Survey

Programmatic Uses

UI Tax Rate & Actuarial Analysis

UI-Covered Employment

Local Area Unemployment

Social Security Administration

Federal Funds Allocation $321 Billion (HUD, USDA, HCFA/CHIP)

Other Agencies and States:
- NAWS/DOL
- NASS: Rural Innovation Survey
- States: Job Vacancies, Green Jobs Wage and Benefits Surveys

BLS

Uses and analysis – cont'd.

■ **Users of BED job dynamics data include**
- ▶ Federal Reserve System
- ▶ Small Business Administration
- ▶ Academics

BLS

Sustainable, scalable, matchable

- QCEW can be leveraged for new uses with **little to no additional:**
  - ▶ Respondent burden
  - ▶ Cost
- Examples
  - ▶ Non-profit economy
  - ▶ Hurricane flood zone maps

BLS

Sustainable, scalable, matchable – cont'd.

- More initiatives to leverage QCEW
  - ▶ Intra-BLS projects
    - – Foreign Direct Investment
    - – Quarterly Refiling Survey pilot
  - ▶ Enterprise data
  - ▶ Wage records

BLS

Archiving

- Linked micro data
  - ▶ 1990-present
  - ▶ Confidential
- Unlinked micro data
  - ▶ 1975-present
  - ▶ Confidential
- Detailed tabulations
  - ▶ 1975-present
  - ▶ Public website

QCEW bottom line

- Product of robust Fed-state partnership
- Comprehensive, detailed, accurate, relevant and timely
  - ▶ Supports decentralized decision-making
  - ▶ Cannot be replicated by private sector
  - ▶ Underlies key official and nonofficial statistics
  - ▶ Serves all parts of country and economy
- Flexible—supporting modernization, add-ons, matching, modeling and upgrades to other programs

QCEW: High-ROI component of our national informational infrastructure

BUILDING A MASSIVE LONGITUDINAL PANEL

DAVID B. GRUSKY
STANFORD UNIVERSITY

DECEMBER 12, 2016

PRESENTION TO THE ...
COMMISSION ON EVIDENCE-BASED POLICYMAKING

EVIDENCE DEFICIT

QUESTION: WHY ISN'T THERE AUTHENTIC EVIDENCE-BASED POLICYMAKING?

ANSWER: WE DON'T YET HAVE THE CAPACITY TO BRING IRREFUTABLY HIGH-QUALITY EVIDENCE TO BEAR ON THE FULL GAMUT OF PROGRAMS AND INTERVENTIONS

IF WE DON'T DEVELOP THAT CAPACITY SOON, CYNICISM MAY SET IN AND THE EVIDENCE-BASED POLICYMAKING MOVEMENT MAY BE ABANDONED

STANFORD CENTER ON
POVERTY AND INEQUALITY

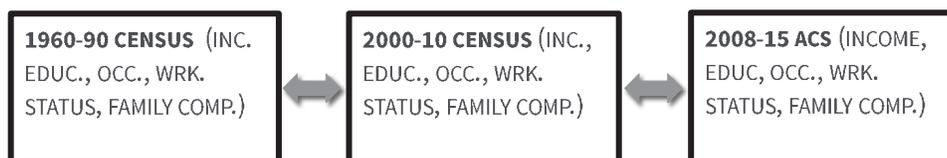
HOW CAN THAT CAPACITY BE DEVELOPED?

BUILD A MASSIVE LONGITUDINAL PANEL (THAT EXISTS IN LATENT FORM AND IS ASSEMBLED ON DEMAND ... ONLY DELIVERING THE VARIABLES THAT ARE RESEARCH-NECESSARY)

THREE STEPS

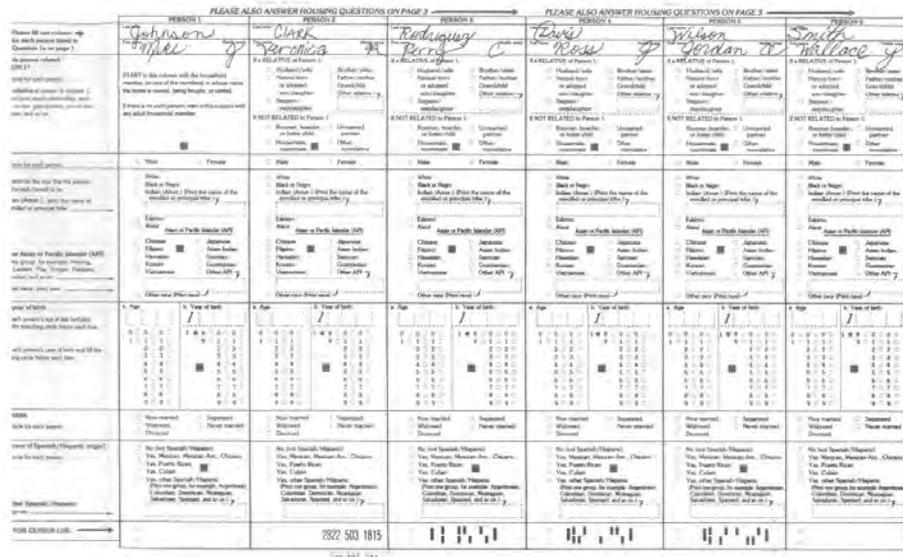
STANFORD CENTER ON
POVERTY AND INEQUALITY

STEP I: BUILD THE POPULATION FRAME

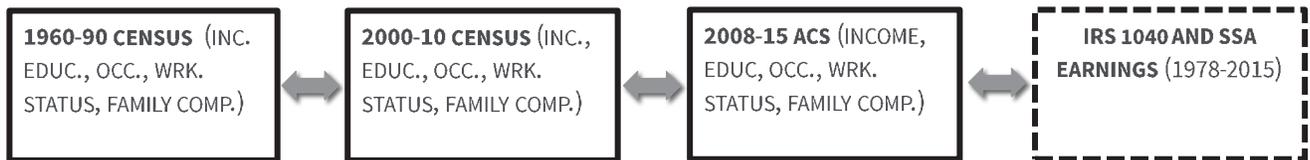
1960-90 CENSUS (INC. EDUC., OCC., WRK. STATUS, FAMILY COMP.)	⟷	2000-10 CENSUS (INC., EDUC., OCC., WRK. STATUS, FAMILY COMP.)	⟷	2008-15 ACS (INCOME, EDUC, OCC., WRK. STATUS, FAMILY COMP.)


- CONVERT CROSS-SECTIONAL DATA INTO MASSIVE LONGITUDINAL PANEL VIA PIKing
- PRESERVE AND RECORD INTERGENERATIONAL LINKAGES
- REPRESENTS THE U.S. POPULATION ... REACHING A HALF-CENTURY INTO THE PAST
- SELF-REFRESHING AS WE MOVE INTO THE FUTURE

STANFORD CENTER ON
POVERTY AND INEQUALITY

DIGITIZATION IS SURMOUNTABLE TECHNICAL CHALLENGE


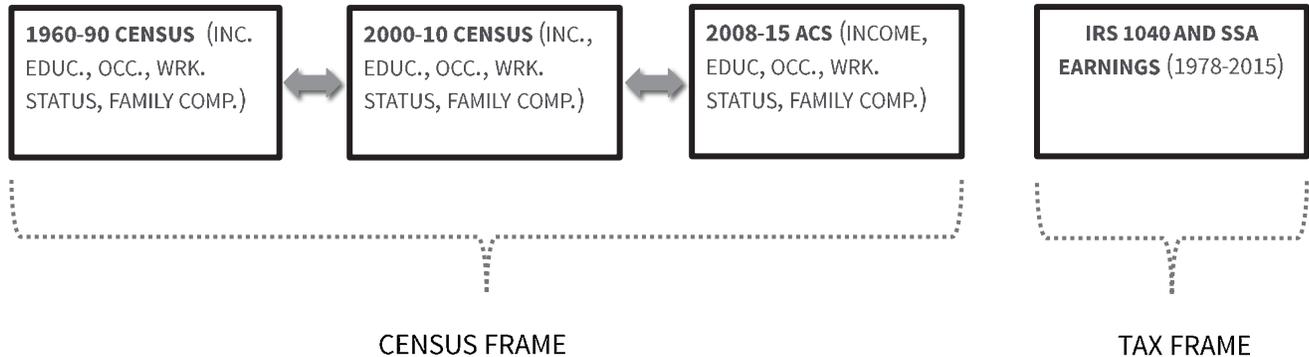
STEP II: RAMP UP THE POPULATION FRAME (IF POSSIBLE)

| **1960-90 CENSUS** (INC. EDUC., OCC., WRK. STATUS, FAMILY COMP.) | ⟷ | **2000-10 CENSUS** (INC., EDUC., OCC., WRK. STATUS, FAMILY COMP.) | ⟷ | **2008-15 ACS** (INCOME, EDUC, OCC., WRK. STATUS, FAMILY COMP.) | ⟷ | **IRS 1040 AND SSA EARNINGS** (1978-2015) |


- LINK TO TAX AND EARNINGS RECORDS (IF POSSIBLE)
- PROVIDES MORE FREQUENT UPDATES FOR LARGE SWATH OF POPULATION

THE FALLBACK: TWO SEPARATE FRAMES (I.E., BUSINESS AS USUAL ... ON STEROIDS)

| **1960-90 CENSUS** (INC. EDUC., OCC., WRK. STATUS, FAMILY COMP.) | **2000-10 CENSUS** (INC., EDUC., OCC., WRK. STATUS, FAMILY COMP.) | **2008-15 ACS** (INCOME, EDUC, OCC., WRK. STATUS, FAMILY COMP.) | **IRS 1040 AND SSA EARNINGS** (1978-2015) |

CENSUS FRAME   TAX FRAME


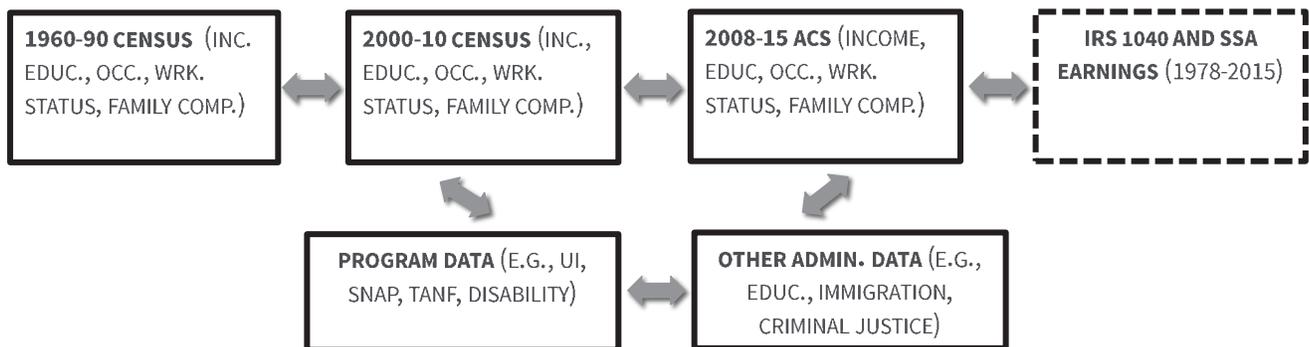
NOTE: CHOOSE THE FRAME THAT'S BEST SUITED FOR RESEARCH QUESTION AT HAND

STANFORD CENTER ON
POVERTY AND INEQUALITY

STEP II: HANG ADMINISTRATIVE DATA OFF POPULATION FRAME

| **1960-90 CENSUS** (INC. EDUC., OCC., WRK. STATUS, FAMILY COMP.) | **2000-10 CENSUS** (INC., EDUC., OCC., WRK. STATUS, FAMILY COMP.) | **2008-15 ACS** (INCOME, EDUC, OCC., WRK. STATUS, FAMILY COMP.) | **IRS 1040 AND SSA EARNINGS** (1978-2015) |

PROGRAM DATA (E.G., UI, SNAP, TANF, DISABILITY)

OTHER ADMIN. DATA (E.G., EDUC., IMMIGRATION, CRIMINAL JUSTICE)


- AGGRESSIVE PROGRAM OF NEGOTIATING DATA-SHARING AGREEMENTS (I.E., CURRENT EFFORTS PUT ON STEROIDS)
- LED BY CARRA AND SUPPORTED BY UNIVERSITIES AND STATE & LOCAL GOVERNMENTS THROUGHOUT COUNTRY
- AGGRESSIVE PROGRAM OF HARMONIZING DATA
- RAMP-UP OF FSRDCs AND SECURITY PROTOCOLS

STEP III: LINK SURVEYS THAT HAVE IDENTIFIERS

```
┌─────────────────┐      ┌─────────────────┐      ┌─────────────────┐      ┌ ─ ─ ─ ─ ─ ─ ─ ─ ┐
│ 1960-90 CENSUS  │      │ 2000-10 CENSUS  │      │ 2008-15 ACS     │        IRS 1040 AND SSA
│ (INC. EDUC.,    │◄────►│ (INC., EDUC.,   │◄────►│ (INCOME, EDUC,  │◄────►  EARNINGS (1978-2015)
│ OCC., WRK.      │      │ OCC., WRK.      │      │ OCC., WRK.      │
│ STATUS, FAMILY  │      │ STATUS, FAMILY  │      │ STATUS, FAMILY  │      └ ─ ─ ─ ─ ─ ─ ─ ─ ┘
│ COMP.)          │      │ COMP.)          │      │ COMP.)          │
└─────────────────┘      └─────────────────┘      └─────────────────┘
```

1960-90 CENSUS (INC. EDUC., OCC., WRK. STATUS, FAMILY COMP.)

2000-10 CENSUS (INC., EDUC., OCC., WRK. STATUS, FAMILY COMP.)

2008-15 ACS (INCOME, EDUC, OCC., WRK. STATUS, FAMILY COMP.)

IRS 1040 AND SSA EARNINGS (1978-2015)

PROGRAM DATA (E.G., UI, SNAP, TANF, DISABILITY)

OTHER ADMIN. DATA (E.G., EDUC., IMMIGRATION, CRIMINAL JUSTICE)

SURVEYS (E.G., SIPP)

NOTE: SURVEYS ONLY USED TO DELIVER VARIABLES THAT ARE UNAVAILABLE IN ADMINISTRATIVE SOURCES

THE TWO PAYOFFS

IMPROVED MONITORING OF BASIC SOCIAL INDICATORS

IMPROVED PROGRAM EVALUATION

PAYOFF #1: IMPROVED MONITORING OF KEY SOCIAL INDICATORS

POVERTY
MOBILITY
EDUCATIONAL ATTAINMENT
INCOME AND EARNINGS
INEQUALITY

STANFORD CENTER ON
POVERTY AND INEQUALITY

AN EXAMPLE OF "MAKING DO"

THE U.S. IS COMMITTED TO DELIVERING HIGH RATES OF SOCIAL AND ECONOMIC
MOBILITY (A KEY MEASURE OF SYSTEMIC HEALTH)

COMMON DEFINITION OF AMERICAN DREAM: CHILDREN HAVE A HIGHER STANDARD OF
LIVING THAN THEIR PARENTS (I.E., "ABSOLUTE MOBILITY")

OPERATIONALIZATION: DO CHILDREN AT AGE 30 HAVE HIGHER INFLATION-ADJUSTED
INCOME THAN THEIR PARENTS (AT SAME AGE)?

DO NOT HAVE A LONG-RUN TIME SERIES … WE'RE RUNNING OUR MOBILITY POLICY IN
THE BLIND

STANFORD CENTER ON
POVERTY AND INEQUALITY

ABSOLUTE MOBILITY ANALYSIS (CHETTY, GRUSKY, HENDREN, MANDUCA, NARANG, AND HELL)

IF WE'RE WILLING TO MAKE A (BIG) ASSUMPTION, TRENDS IN ABSOLUTE MOBILITY CAN BE CALCULATED *WITHOUT* PANEL DATA OVER TIME

PROCEED INSTEAD WITH THREE TYPES OF INFORMATION:

> INCOME DISTRIBUTIONS FOR CHILDREN OVER THE LAST FOUR DECADES (WHEN CHILDREN ARE AROUND 30 YEARS OLD) ... BASED ON 1970-2014 CURRENT POPULATION SURVEYS

> INCOME DISTRIBUTIONS FOR PARENTS OF THOSE CHILDREN (WHEN PARENTS ARE AROUND 30 YEARS OLD) ... BASED ON 1940-1990 DECENNIAL CENSUSES

> TRANSITION MATRIX INDICATING THE PROBABILITY, FOR EACH ORIGIN PERCENTILE, OF ENDING UP IN EACH POSSIBLE OUTCOME PERCENTILE

STANFORD CENTER ON
POVERTY AND INEQUALITY

THE TRANSITION MATRIX CLOSE UP

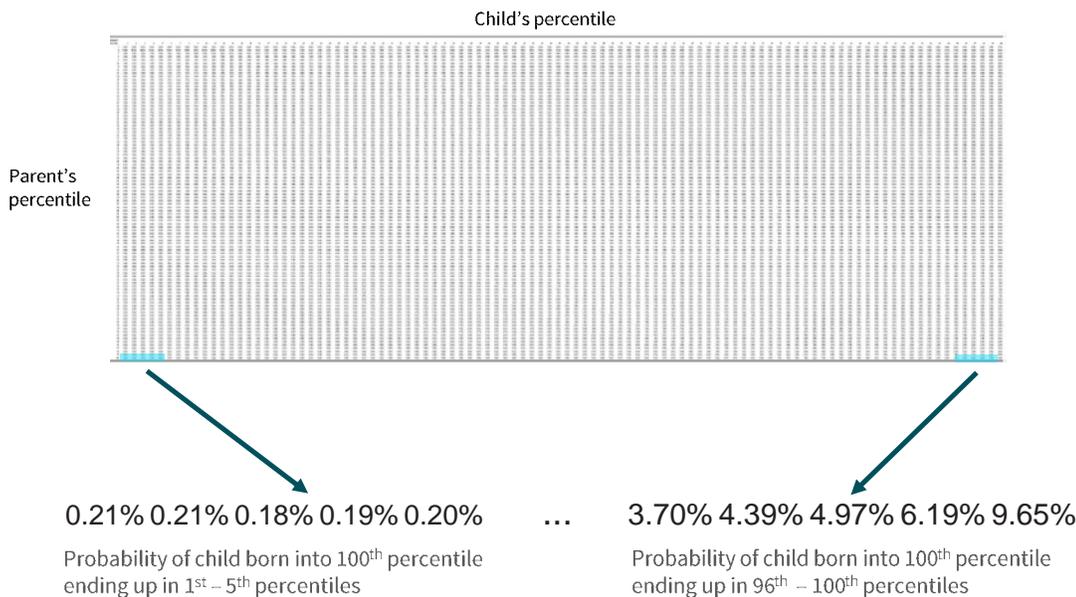
Population tax data for 1980-82 birth cohorts (10 million children) [Chetty, Hendren, Kline, Saez, Turner 2015]

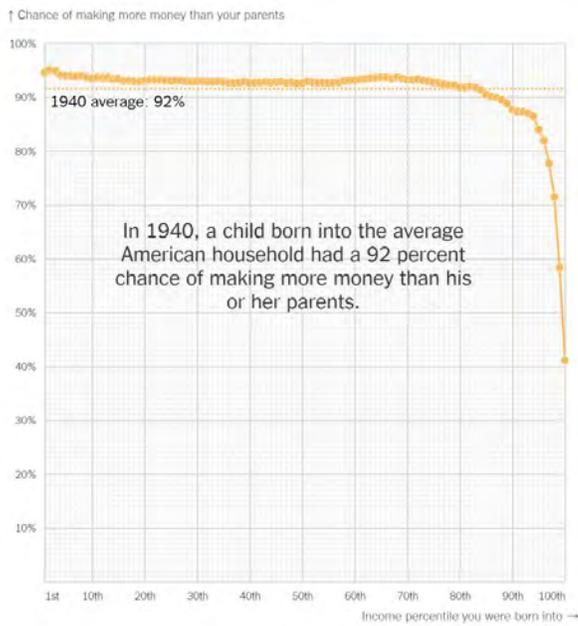
Child's percentile

Parent's percentile

0.21% 0.21% 0.18% 0.19% 0.20%   ...   3.70% 4.39% 4.97% 6.19% 9.65%

Probability of child born into 100th percentile ending up in 1st – 5th percentiles

Probability of child born into 100th percentile ending up in 96th – 100th percentiles


ABSOLUTE MOBILITY FOR 1940 BIRTH COHORT


↑ Chance of making more money than your parents

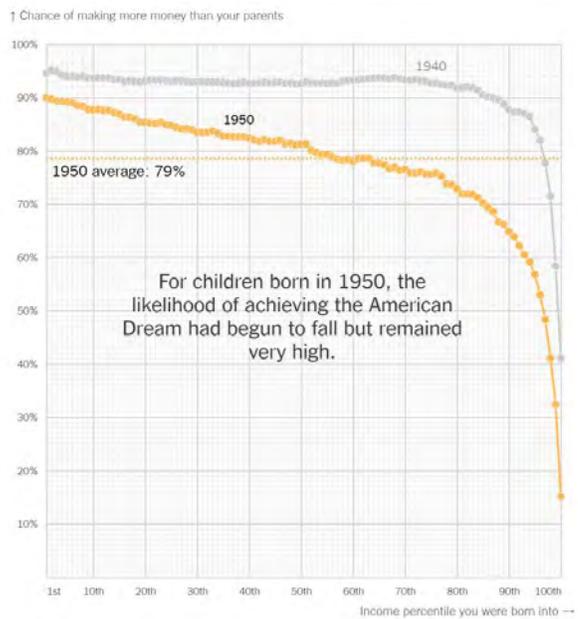
1940 average: 92%

In 1940, a child born into the average American household had a 92 percent chance of making more money than his or her parents.

Income percentile you were born into →

NY TIMES, DEC. 8, 2016, THE FADING AMERICAN DREAM, DAVID LEONHARDT

STANFORD CENTER ON
POVERTY AND INEQUALITY

ABSOLUTE MOBILITY FOR 1950 BIRTH COHORT


↑ Chance of making more money than your parents

1940

1950

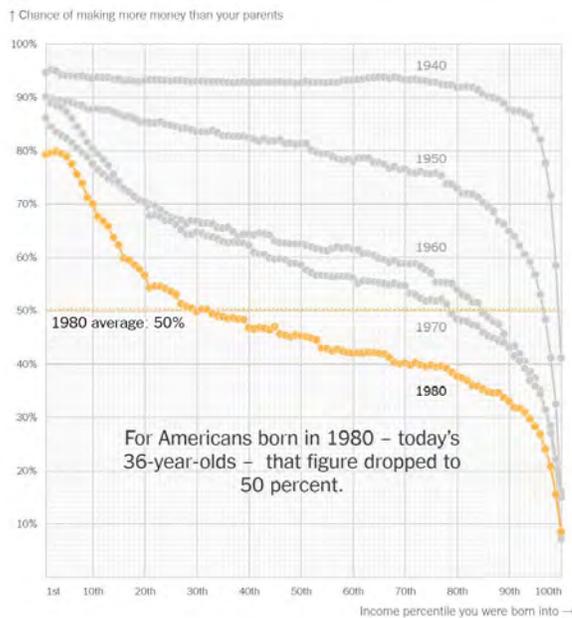
1950 average: 79%

For children born in 1950, the likelihood of achieving the American Dream had begun to fall but remained very high.

Income percentile you were born into →

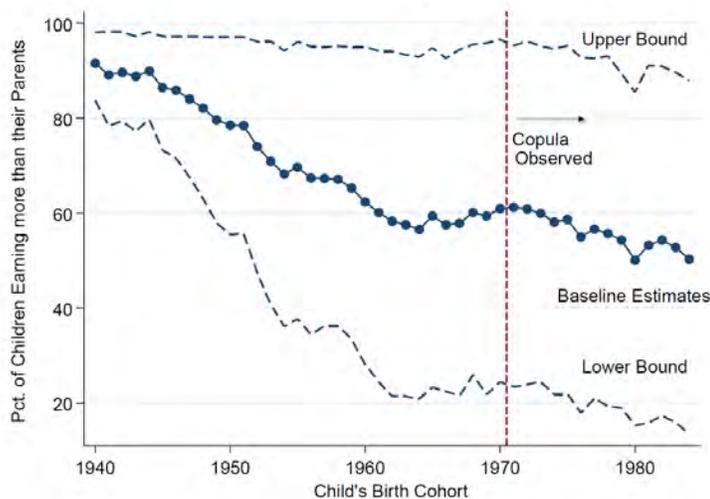
NY TIMES, DEC. 8, 2016, THE FADING AMERICAN DREAM, DAVID LEONHARDT

STANFORD CENTER ON
POVERTY AND INEQUALITY

ABSOLUTE MOBILITY FOR ALL BIRTH COHORTS


NY TIMES, DEC. 8, 2016, THE FADING AMERICAN DREAM, DAVID LEONHARDT

STANFORD CENTER ON
POVERTY AND INEQUALITY

IDENTIFYING UPPER AND LOWER BOUNDS UNDER ALL PLAUSIBLE COPULAS


COPULA DOESN'T MATTER IN THE PAST (BECAUSE THE MARGINAL DISTRIBUTIONS ARE DETERMINATIVE)

ALTHOUGH THE COPULA DOES MATTER IN THE PRESENT, THAT'S WHEN WE HAVE THE DATA

STANFORD CENTER ON
POVERTY AND INEQUALITY

IT SHOULDN'T HAVE TO BE THIS WAY

IMPLICATION: WE CAUGHT A BREAK (I.E., WE ONLY NEED TO KNOW THE COPULA WHEN WE HAPPEN TO HAVE IT)

JUST AN EXAMPLE: ACROSS-THE-BOARD RESORT TO AMERICAN INGENUITY

IT SHOULDN'T BE NECESSARY TO "CATCH A BREAK" TO CARRY OUT THE MOST BASIC TREND ANALYSIS

STANFORD CENTER ON
POVERTY AND INEQUALITY

PAYOFF #2: PROGRAM EVALUATION WILL ALSO BE TRANSFORMED

LINKED ADMINISTRATIVE DATA WILL FUNDAMENTALLY CHANGE HOW WE EVALUATE EFFECTS OF POLICY, PROGRAMS, EVENTS, AND INSTITUTIONAL PARTICIPATION

A FEW EXAMPLES

STANFORD CENTER ON
POVERTY AND INEQUALITY

EXAMPLE 1: LONG-RUN EFFECTS SEAMLESSLY TRACKED

THE NUMBER ONE LESSON FROM PROGRAM EVALUATION: DON'T IGNORE THE LONG RUN
- WORRIES ABOUT WASHOUT OF EFFECTS
- WORRIES ABOUT "SLEEPER EFFECTS" THAT SURFACE LATER

BUT LONG-RUN PANEL SURVEYS ARE EXTREMELY EXPENSIVE AND PLAGUED BY ATTRITION

STANFORD CENTER ON
POVERTY AND INEQUALITY

EXAMPLE 2: INTERGENERATIONAL EFFECTS SEAMLESSLY TRACKED

A PARTICULARLY IMPORTANT TYPE OF LONG-RUN EFFECT: THE INTERGENERATIONAL EFFECT
(E.G., POSITIVE EFFECTS OF EITC ON CHILDREN ... WHEN THEY'RE ADULTS)

STANFORD CENTER ON
POVERTY AND INEQUALITY

EXAMPLE 3: BIG DATA HAS PAYOFFS

ALLOWS FOR QUASI-EXPERIMENTAL ASSESSMENTS (E.G., USING PLANT CLOSINGS, HURRICANE KATRINA TO IDENTIFY EFFECT OF MOVING)

ALLOWS US TO EVALUATE ONE-SIZE-FITS-ALL POLICY
- IRON LAW OF PROGRAM EVALUATION: HETEROGENEITY OF EFFECTS (ACROSS DEMOGRAPHIC GROUPS, NEIGHBORHOODS, ETC.)
- LINKED ADMINISTRATIVE PANELS ARE LARGE ENOUGH TO EVALUATE PROGRAMS ACROSS WIDE RANGE OF SUBPOPULATIONS

**STANFORD CENTER ON
POVERTY AND INEQUALITY**

EXAMPLE 4: EMBEDDED EXPERIMENTS

TRACK EXPERIMENTAL AND CONTROL GROUPS "ON THE NATURAL" WITHIN ADMINISTRATIVE PANEL

EXAMPLE: Y COMBINATOR BASIC INCOME EXPERIMENT IN CALIFORNIA

REDUCES COST OF EXPERIMENTS

**STANFORD CENTER ON
POVERTY AND INEQUALITY**

IT'S CHEAP (AND MAINLY ONE-TIME COSTS)

ONE-TIME COSTS

NEGOTIATING AGREEMENTS (BRUTE-FORCE ANALOGUE TO HUMAN GENOME PROJECT)

ADDRESSING INCENTIVES FOR SHARING

LINKING AND HARMONIZING

ONGOING COSTS

APPENDING NEW DATA (LARGELY "SELF-REFRESHING")

EXPLOITING NEW CAPACITY

THE RESULT: WE LEAD THE WORLD IN BUILDING A PUBLIC SECTOR THAT WORKS

STANFORD CENTER ON
POVERTY AND INEQUALITY

WHY WE MUST DO IT ... NOW

MANY WOULD SAY THAT IT'S TOO HARD AND JUST CAN'T BE DONE ... BUT THERE'S TOO MUCH AT STAKE

MASSIVE PUBLIC SECTOR SAVINGS: AN *EFFECTIVE* LEAN GOVERNMENT MUST RUN VERY CLOSE TO THE EVIDENCE

- INVISIBLE HAND CREATES EFFICIENCIES IN PRIVATE SECTOR
- VISIBLE HAND (OF EVIDENCE) CREATES EFFICIENCIES IN PUBLIC SECTOR (E.G., PAY FOR SUCCESS)

WE'RE LOSING THE INTERNATIONAL COMPETITION

MUST ACT BEFORE CYNICISM SETS IN

STANFORD CENTER ON
POVERTY AND INEQUALITY

U.S. Census Bureau Infrastructure Overview

Ron Jarmin
Associate Director, Economic Programs

December 12, 2016

United States **Census** Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

CEP questions

1. Does the model acquire (or ingest) data?
2. Does the model curate data?
3. Does the model link data?
4. Does the model analyze data?
5. Does the model provide for sustainability and scalability?
6. Does the model archive data?

United States **Census** Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

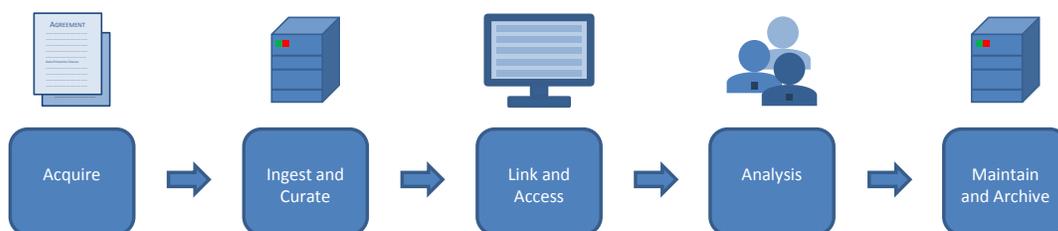
2

In a word…

Yes…the Census Bureau acquires, ingests, curates, links, analyzes, and archives data. And, yes, we are striving to promote a sustainable and scaleable model for accessing a range of high-value, sensitive, confidential information.

| Acquire | → | Ingest and Curate | → | Link and Access | → | Analysis | → | Maintain and Archive |

United States™ Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

3


Overview

1. Census Bureau mission and authorities
2. Infrastructure and data assets
3. Enhancements and opportunities

United States™ Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

4

Mission

The Census Bureau's *mission* is to measure the nation's people and economy. We honor privacy, protect confidentiality, share our expertise globally, and conduct our work openly.

More specifically, how do we realize our mission in the context of evidence-building?

- Increase the awareness and acceptance of administrative data in federal statistics
- Identify, acquire, ingest, process, link, and analyze administrative data
- Create products that demonstrate the value of data linkage and linked data

United States™ Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

5

Legal framework and authority

Title 13 provides authorities for for protecting and accessing high value information about the nation's population and economy.

Protecting　　**Accessing**

- **6**: acquire and utilize records to the greatest extent possible

- **8**: reimbursable studies and joint statistical projects

- **9**: protect confidential individual and establishment data, limit access, and statistical uses

- **23(c)**: swear in researchers to assist the Census Bureau

United States™ Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

6

Infrastructure and data assets

external data sources: administrative and 3rd-party data

linked data: products, research, and program evaluation

censuses, surveys, and frames

3 Examples

- CARRA data linkage infrastructure
- Longitudinal-Employer Household Dynamics ("LEHD")
- Federal Statistical Research Data Centers (FSRDC)

United States Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

7

CARRA: individuals and households

Federal data	State data	3rd-party data
• Internal Revenue Service • Housing and Urban Development • Childcare Development Fund • Medicaid and Medicare • Social Security Administration • Veteran's Administration • U.S. Postal Service • Selective Service	• Women, Infants, and Children • Temporary Assistance for Needy Families • Supplemental Nutrition Assistance Program • Low Income Energy Assistance Program • Child Care Subsidy	• Contact frame • Public schools • Property and tax foreclosure

Current evidence-building projects

- Joint work with BJS, BOP, CMS, ERS, IRS, SSA, and VA programs, as well as a forthcoming project with HUD

- Longitudinal linkage projects with ten institutions in seven FSRDCs, the Census Longitudinal Infrastructure Project (CLIP)

- Twelve evidence building pilots, including Chapin Hall pilot projects

United States Census Bureau
U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

10

Research Data Centers: **FSRDCs**

- Program created: Census Bureau creates program at HQ in mid-1980's for access to business data

- Institutional Partners
  - First remote location added in 1994
  - 24 locations as of 2016, 6 in development
  - 259 active projects and 100 projects "on deck"

- Federal Partners
  - AHRQ and NCHS join RDC program as partners in 2008.
  - BLS joined in 2016 as a partner
  - Interagency Council on Statistical Policy (ICSP) approves rebranding to Federal Statistical RDCs (**FSRDC**) in 2015

United States Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

11

Physical Locations

United States Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

12

Interconnectivity

Note: Graph includes only external projects. Node (FSRDC) size and color are proportional to the number of sponsored projects. Edge thickness and color are proportional to the number of projects on which each pair of FSRDCs collaborate.

LEHD Infrastructure

QCEW = Quarterly Census of Employment and Wages
UI = Unemployment Insurance
OPM = Office of Personnel Management

Current and planned LEHD projects

- Internal Projects
  - Job-to-Job Flows Data Set
  - Labor Market Outcomes Associated with Military Service
  - Education Pilot

- Other Federal Projects (DOL)
  - Homeless Veterans Reintegration
  - Trade Adjustment Act Evaluation

- External Projects
  - Firm Financial Constraints and Employment
  - Labor Market Implications of External Shocks

United States™ Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

15

How to access LEHD data

- Internal Projects
  - Partner with Census Bureau researchers
  - Must abide by specific rules stated in Memorandum of Understanding (MOU)
  - Limitations: capacity constraints, state laws, release of state-specific results

- Federal Statistical Research Data Center (FSRDC) Projects
  - Well-established process
  - Additional hurdles for access to full LEHD data

United States™ Census Bureau | U.S. Department of Commerce
Economics and Statistics Administration
U.S. CENSUS BUREAU
census.gov

16

Enhancements to infrastructure

- Cloud-based data facility in partnership with NYU as Software as a Service (SaaS) platform

- Short-term and long-term solutions for creating and displaying metadata

- Data infrastructure website [http://www.census.gov/about/adrm/linkage.html]

- Research partnerships with DARPA XDATA performers and academic collaborators

- Hardware and software upgrades

IRS Statistics of Income Division's Joint Statistical Research Program

Barry Johnson,
Director, Statistics of Income

SOI History and Mission

The Revenue Act of 1916 requires the Secretary of the Treasury to publish statistics on the operations of the tax system, at least annually (Internal Revenue Code Section 6108(a))

Statistics of Income Mission

Formulate and execute the statistical policies, practices, and programs of the Internal Revenue Service. Collect, analyze, safeguard, and disseminate information on Federal taxation in support of tax administration, economic policy development, and financial analysis. Serve a broad range of users in the IRS, the Federal government, the public, and the nonprofit sectors. Provide statistical support within the Service for a broad range of program evaluation and measurement analytics. Lead efforts to modernize federal statistical programs and practices through engagement with the federal statistical community.

Statistics of Income

SOI Mission (cont.)

- Unlike agencies that collect data through censuses and surveys, SOI collects its data from the administrative records created from IRS processing of tax and information returns

- Data collected from almost 250 forms and schedules

- SOI uses data from administrative processing to form the core of its products

- SOI adds value by:

  - Collecting additional information from forms, schedules, and attachments

  - Reorganizing information to add consistency

  - Coding data items to make them statistically useful

  - Performing rigorous quality checks to improve accuracy and reliability

3　**Joint Statistical Research Program**

The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Joint Statistical Research Program

Goals:

- Provide new understandings of taxpayer behavior that impact the administration of the U.S. tax system

- Provide new insights into ways that existing tax policies affect people, businesses, and the economy

- Suggest tax policy solutions to advance the common good

4　**Joint Statistical Research Program**

The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Research Projects Must Support Tax Administration

Internal Revenue Code Section 6103(b)4:

i) the administration, management, conduct, direction, and supervision of the execution and application of the internal revenue laws or related statutes (or equivalent laws and statutes of a State) and tax conventions to which the United States is a party, and

(ii) the development and formulation of Federal tax policy relating to existing or proposed internal revenue laws, related statutes, and tax conventions

5 **Joint Statistical Research Program**

The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Project Management - Data

- o Access to all available IRS data and SOI samples, as required to support specific projects including
  - Longitudinal administrative data sets
  - Curated cross-section and panel sample files
- o Able to bring in non-IRS data for linkage to IRS files:
  - Researcher must obtained license/ permission
  - License must explicitly permit linkage
- o Access data primarily at IRS facilities using IRS equipment
  - Exploring placing IRS equipment at Federal Statistical Data Centers for researcher convenience

Joint Statistical Research Program

The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Project Management - Arrangements

- Some projects do not require research access to data
- Data access vehicles include:
  - Intergovernmental Personal Mobility Arrangement (IPA)
  - Student Volunteer Agreement
  - Contract
- When accessing data, researchers:
  - Must undergo full background investigation and data security and protection training
  - Are subject to disclosure penalties and prosecution
- Projects ideally last 2 years, but extensions are possible to:
  - Facilitate peer review comments
  - Expand work particularly beneficial to tax administration

7   **Joint Statistical Research Program**

The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Project Management – SOI Staff Role

SOI assigns all projects to staff with subject-matter expertise:

- Serve as technical resources and ensure compliance with project scope and performance period

- Review all interim and final products for compliance with data-use limitations, contract guidelines, and disclosure limitation standards

- Manage administrative processes
  - SOI must rely on shared HCO and contract management resources
  - Technology support and equipment availability vary depending on geographic location of researcher

8   **Joint Statistical Research Program**

The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Project Solicitation and Selection

o Solicitation of proposals:

- Email to SOI Listserv subscribers and through various professional organization mailing lists
- Presentations at NTA, NBER

o Evaluation criteria:

- Tax administration relevance, contribution to IRS goals and mission
- Data availability
- Availability of SOI staff to participate in and/or oversee work
- Researcher skills, quality of research plan, proposed timeframe

o Projects selected by committee of IRS and U.S. Treasury Department staff

9   **Joint Statistical Research Program**
The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Research Projects

Call for proposals	Number of applicants	Number of projects selected	Number of institutions represented*
2008	10	4	5
2012	51	17	13
2014	80	12	17
2016	Call for proposals announced 11/9/16 and closes 12/31/16		

* Some projects bring together researchers from multiple institutions

10   **Joint Statistical Research Program**
The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Selected Research Contributions:

- The impact of tax expenditures and methods for increasing program participation
- Measures of intergenerational income mobility
- The impact of education tax credits
- Understanding how workers use taxable withdraws of pension funds
- The effects of tax rates on labor-force participation and migration
- Compliance studies – auditor effects, impact of offshore voluntary disclosure
- New understandings of business behavior

11 **Joint Statistical Research Program**
The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

Statistics of Income

Additional Benefits of a Research Program

Administrative Data Enhancements

- IRS Data Bank
  - Basic individual level data
  - Variables needed to link to additional information
  - Improved metadata
  - Adding data from information documents (W-2, 1099, etc.)
- Improved analytical tools - Stata and R
- Improved management of computing space and processing techniques

Enhancements to publicly released products

- New income data tabulations
- Redesigned public-use individual income tax file
- New data on low-income earners (forthcoming)
- Better understanding of flow-through businesses

12 **Joint Statistical Research Program**
The content of this presentation is the opinion of the writer(s) and does not necessarily represent the opinion of the Internal Revenue Service

U.S. DEPARTMENT OF EDUCATION

IES Data Licensing Program

Marilyn M. Seastrom, Ph.D.

Presentation for the
Commission on Evidence-Based Policymaking
December 12, 2016
Washington, DC

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

U.S. DEPARTMENT OF EDUCATION

Legal Context: Privacy Law

The Privacy Act of 1974 (5 U.S.C. 552a)

- Governs the collection, maintenance, use, and dissemination of personally identifiable information (PII) about individuals maintained by Federal agencies

- No agency shall disclose any record to any person without the prior written consent of the individual (there are certain exceptions)

- A willful disclosure could result in a misdemeanor and fine of not more than $5,000

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

2

U.S. DEPARTMENT OF EDUCATION

Legal Context: Confidentiality Law

The Family Educational Rights and Privacy Act (20 U.S.C. § 1232g; 34 CFR Part 99) protects the privacy of student education records

- FERPA applies to all schools that receive funds under an applicable program of the U.S. Department of Education

- FERPA allows schools to disclose those records to specified officials for audit or evaluation purposes

- FERPA applies to administrative record data that NCES obtains from the school or institution without the explicit written consent of the parent or student

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

3

U.S. DEPARTMENT OF EDUCATION

Legal Context: Confidentiality Law

Confidential Information Protection and Statistical Efficiency Act (CIPSEA) of 2002 (P.L. 107-347, Title V)

- Protects personally identifying information from disclosure when information is collected under a pledge of confidentiality and for statistical purposes

- A willful disclosure could result in a class E felony with fines up to $250,000 and/or up to five years in prison

- Allows an agency's agents to access restricted data.

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

4

U.S. DEPARTMENT OF EDUCATION

Legal Context: IES Confidentiality Law

Education Sciences Reform Act (ESRA) of 2002 -
Confidentiality Section (20 U.S.C. 9573)

- All individually identifiable information about students, their families, and their schools shall remain confidential

- Individually identifiable information is immune from the legal process and cannot be used in any judicial proceeding (except in the case of terrorism

ies NATIONAL CENTER FOR
EDUCATION STATISTICS
Institute of Education Sciences

5

U.S. DEPARTMENT OF EDUCATION

Legal Context: IES Confidentiality Law

- Under the IES confidentiality law, no person may:

  - Use any individually identifiable information for a non-statistical purpose (except in the case of terrorism)

  - Release data that could identify a person, or

  - Permit unauthorized persons to examine the individual data

ies NATIONAL CENTER FOR
EDUCATION STATISTICS
Institute of Education Sciences

6

U.S. DEPARTMENT OF EDUCATION

Legal Context: IES Confidentiality Law

- Under the IES confidentiality law, Federal employees, contractors, and licensees who are obligated to obey this law and who knowingly disclose any individually identifiable information, will be subject to a class E felony with fines up to $250,000 and/or up to five years in prison

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

7

U.S. DEPARTMENT OF EDUCATION

Data Curation: IES Confidentiality Procedures

- Disclosure Review Board—IES technical staff
  - Approve data perturbations
  - Clear files for release
    - Direct identifiers are removed—de-identified restricted use file
    - Sensitive information is removed or recoded— anonymized public use file
      - Top- and bottom-coding
      - Categories

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

8

Data Linkage: IES Confidentiality Procedures

- Restricted use data may be linked to
  - Department of Education administrative data at the student and institution levels
  - Other Federal data at the student level
  - External third party data at the student and institution levels
  - Aggregate data from Census/ACS using geocodes

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

9

Data Access: IES Confidentiality Procedures

- **Data Analysis Systems**—user specified tabulations are provided online using restricted use data
  - National Data Explorer (NDE)—NAEP
  - International Data Explorer (IDE)—TIMSS, PISA, PIRLS, PIAAC
  - PowerStats—NPSAS, BPS, B&B, ELS, HSLS, SSOCS
- **Restricted Use Data Licensing**—Qualified external researchers are provided access through a licensing agreement

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

10

Background: IES Data Licensing Program

- Legislation provides the basis for the IES Data Licensing Program
- The IES Director may utilize temporary staff, including employees of Federal, State, or local agencies and employees of private organizations to assist in performing the agency's responsibilities, but only if such temporary staff are sworn to observe the IES confidentiality law (see 20 U.S.C. 9573 (d)(3)).

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

11

Background: IES Data Licensing Program

- Non-IES data users are loaned restricted use data through a license (contract)
- The license is between IES, the user, and the user's organization (e.g., a university, a research institution, or company)
- Licensed users agree to the terms of the IES confidentiality law
- IES loans restricted-use data only to qualified organizations in the 50 States and DC

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

12

U.S. DEPARTMENT OF EDUCATION

Background: IES Data Licensing Program

- History of program:
  - 1989: Initiated talks with OMB to start a trial data licensing system; Developed protocol and legal documents
  - 1991: First license issued
  - 2000: 502 restricted-use licenses
  - 2002: NCES program expanded to IES (ESRA)
  - 2007: Implemented electronic application system
  - 2016: 1,261 restricted-use licenses

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

13

U.S. DEPARTMENT OF EDUCATION

Application: IES Data Licensing Program:

- Submit a formal online request, including
  - Name, title, institutional affiliation, full address, phone number, and e-mail address (researcher only) for the
    - Researcher
    - Senior Official
    - System Security Officer
  - A list of all authorized users on the data license, and
  - Information describing the project (see next slide)

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

14

U.S. DEPARTMENT OF EDUCATION

Application: IES Data Licensing Program

- Information describing the project includes

  - The name, year and subject matter of the data file(s) requested

  - Non IES FERPA protected data, whether the proposed work is to be conducted as a special study, or for or on behalf of a school or institution

  - The project title and a brief description of the research objective and how the requested data will be used

  - An explanation of why the public-use files cannot meet the researcher's need

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

15

U.S. DEPARTMENT OF EDUCATION

Application: IES Data Licensing Program

- Information describing the project includes (continued)

  - A description of any data that will be linked to the requested data

  - An indication of which education sectors will be served by the project

  - An agreement that the requested data will not be used for any administrative or regulatory purpose

  - The length of the requested loan

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

16

U.S. DEPARTMENT OF EDUCATION

Application: IES Data Licensing Program

- The licensee must submit hard copy of

    - Signed license (data use agreement)

    - Signed and notarized affidavits of nondisclosure for each user on license

    - Signed security plan form

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

17

U.S. DEPARTMENT OF EDUCATION

Data Access: Data Licensing Program

- The licensee must agree to
    - Keep the data safe from unauthorized disclosures at all times
    - Participate in unannounced, unscheduled inspections to ensure compliance with license terms and required security procedures
    - Read the *Restricted-Use Data Procedures Manual*.
      http://nces.ed.gov/pubs96/96860rev.pdf
    - Ensure that all users listed on the license read, understand, and follow the license and security plan requirements.

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

18

U.S. DEPARTMENT OF EDUCATION

Analysis: IES Data Licensing Program

- The licensee must agree to

    - Use the ED approved procedure for reporting out tabular results

    - Submit all draft information products to IES for disclosure review

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

19

U.S. DEPARTMENT OF EDUCATION

Analysis: IES Data Licensing Program

- To maintain confidentiality in reports, tabular results must be published

    - With unweighted counts rounded to the nearest 10 or 50

    - As is, if perturbations are present

    - Collapsing tables (columns and/or rows) until there are at least 3 respondents in every cell, if no perturbations

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

20

Maintenance: IES Data Licensing Program

- The licensee must

  - Notify IES immediately if licensee receives any legal or other demand for the data

  - Use the online license system to notify IES of the following types of changes

    - Project operations or security procedures

    - Departures or additions of the project staff

    - The need for additional data

  - Maintain a file of all license documents, amendments and affidavits

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

21

Maintenance: IES Data Licensing Program

- The licensee must (continued)

  - Only keep and access the restricted-use data on a standalone desktop computer.

  - Never place the data on a laptop computer, server, external hard drive or UBS memory stick

  - Purge and overwrite the computer's hard drive before attaching the computer to a modem or network (LAN connection/internet).

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

22

Maintenance: IES Data Licensing Program

- The licensee must (continued)

    - Ensure that only those persons listed on the license have access to the secure project office

    - Ensure that secure project office keys are returned and computer login disabled within 24 hours after any staff leave the project

    - Immediately notify IES of staff changes via amendment

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

23

Closeout: IES Data Licensing Program

- The licensee must:

    - Close the license when the research is completed or the license terminates

        - The restricted-use data and all other individually identifiable information (e.g., the one backup copy, working notes) must be returned to IES or destroyed under IES supervision and procedures

        - The Close-out Certification Form must be sent to IES to complete the license close-out process.

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

24

Operations: IES Management of Licenses

- Review license applications in a transparent matter and track all review outcomes

- Conduct disclosure reviews of work products within 5 business days

- Use physical site inspections and personal interviews to ensure security compliance

- Immediately follow-up with licensee on minor and major license violations

- Review the site inspector's work

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

25

Operations: IES Management of Licenses

- Maintain complete, detailed license records (amendments and users) in searchable format
- Maintain up-to-date contact information on all licensees
- Send security reminders to licensees (via email)
- Track license expiration dates and notify licensee about pending license closure
- Employ agency licensing staff that are detail oriented, efficient, and vigilant

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

U.S. DEPARTMENT OF EDUCATION

Definitions

- **De-identified** information is used to describe records that have enough personally identifiable information removed or obscured, such that the remaining information does not identify a specific individual. Each record includes a re-identification code that can be used by the data manager with a linking key to identify the individual.

- **Anonymization**—data are de-identified, AND do not include a re-identification code; that is, the data cannot be linked back to a file with identifiable data. Anonymized data may also have been subjected to additional statistical disclosure limitation techniques.

ies NATIONAL CENTER FOR EDUCATION STATISTICS
Institute of Education Sciences

January 13, 2017 Meeting

DEUTSCHE BUNDESBANK EUROSYSTEM

Access to Administrative Data in the Bundesbank

Stefan Bender, Head of Research Data and Service Center (RDSC), Deutsche Bundesbank

US Commission International Panel

Washington, D.C. 13 January 2017

(The views expressed here do not necessarily reflect the opinion of the Deutsche Bundesbank or the Eurosystem.)

Data Access in Germany: Historical Development
Where do we come from?

1990s	1998	2001	2004	2016
Access to official statistics was virtually impossible, or very costly	Bottom-up initiative of the research community and data producers	The first research data centers were established	The German Data Forum was established by the Federal Government	30 accredited Research Data Centers

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 2

Policy evaluation can make better use of existing datasets

- **The Bundesbank – like other central banks – produces datasets which are highly valuable for policy analysis and research.**
  - So far, most of these datasets have been used to provide aggregate statistics and ad hoc analysis of specific policy issues.
  - There is significant knowledge of data and institutional background.
- **Systematic use of these data for policy analysis is often constrained by**
  - Time
  - IT-resources
  - Legal restrictions
- **The Bundesbank has launched a large-scale initiative aimed at making better use of existing data both, for policy analysis as well as internal and external researchers.**

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 3

**Scope of the Bundesbank's
Research Data and Service Center (RDSC)**

- **The RDSC is part of the Bundesbank internal project Integrated MicroData-based Information and Analysis System (IMIDIAS)**
- **Goals of IMIDIAS:**
  - Support policymaking process
  - Encourage cooperation with (external) researchers
  - Promote evidence-based policy-making
- **Key principles:**
  - Data as a public good
  - Transparent data access
  - Data protection

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 4

Additional Aspects and Arguments for a RDSC

- **Trust** in researchers needed

- **Data quality** will increase

- **More results** on needed content and topics

- **Better knowledge** on data and content (recruitment)

- **„Branding"**, *„Marketing"*

Factsheet on the RDSC of the Bundesbank

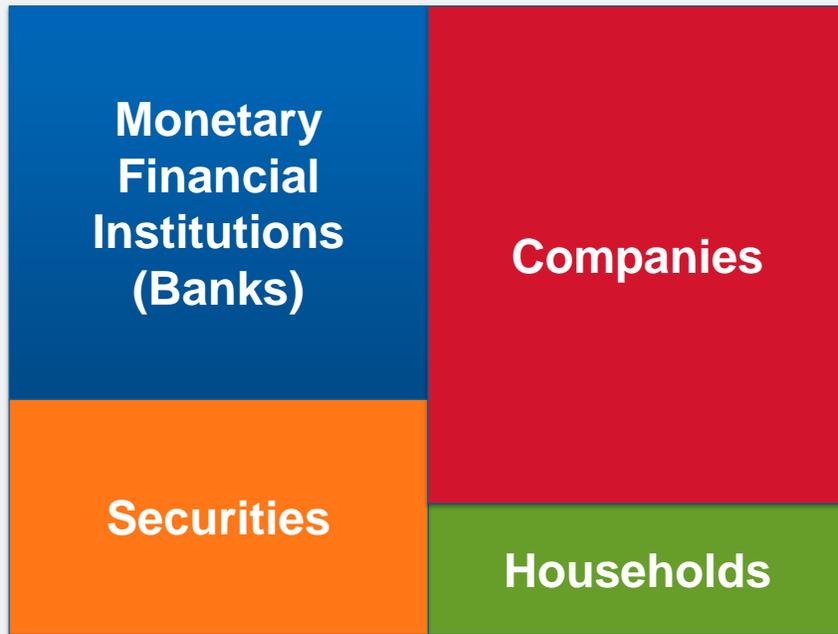
- The RDSC has started in 2014 as part of the Statistics Department of the Bundesbank.

- **The RDSC offers access for non-commercial research to (highly sensitive) micro data of the Bundesbank for free!**

- Over 100 new projects in 2016.

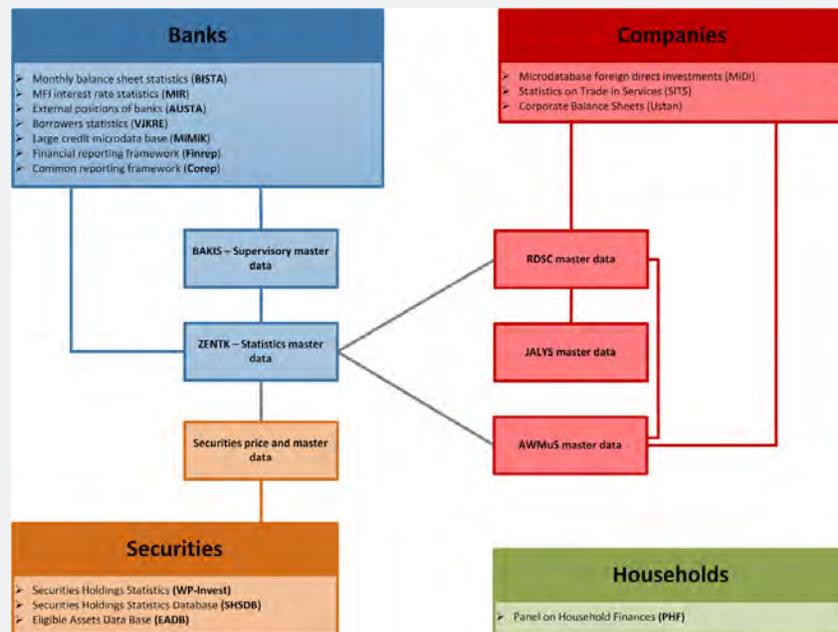
- 14 employees (in 2017 at least 18).

- 12 working places for guest researchers.

Microdata Structure at Deutsche Bundesbank
What treasures does the Bundesbank hide?


Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 7

Microdata Structure at Deutsche Bundesbank
What treasures does the Bundesbank hide?

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 8


The 5 Safes in the RDSC (Portfolio Approach)

- **Safe people**: non-disclosure agreement, contract (with penalty up to 60,000 Euro, publishing the name, exclusion from access up to 2 years).
- **Safe projects**: non-commercial research, project description.
- **Safe environment**: working places without internet connection, (cell) phone, photo, printer and drive.
- **Safe data**: (weakly) anonymized data.
- **Safe results**: output control, papers/presentations are checked.

- **Access to real data**, anonymization is only one dimension, others have more effects on data protection.

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 9

"German Lessons"

- **Development** was/is fast, but **incremental**:
  trust building, growing data complexity, learning process …

- (New) **skills** for researchers / data producers.

- **Engagement** of researchers (value of data work?).

- **Efficiency**: researcher passport, metadata system (with elements of tripadvisor, amazon), project management in a RDC, …

- **Harmonization/Internationalization**: G20 initiative on data sharing and data access of central banks. INEXDA network of 5 central banks has started: France, Italy, Germany, Portugal, UK.

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017

Page 11

Tasks of the RDSC (in more Detail)

The RDSC offers access for non-commercial research to (highly sensitive) micro data of the Bundesbank:

- Generate (linked) micro data

- Offer advisory service on data selection and data access (data handling, research potential, scope and validity of data)

- Provide data access and data protection

- Document data and methodological aspects of the data

- Work on own research projects (in close cooperation with the Bank's business areas and the **Research Centre**)

- Organize conferences and workshops

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 12

Data Access at the RDSC

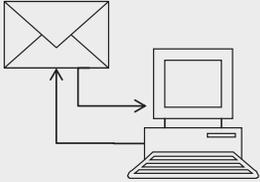
Data Producers
- Survey studies
- Official statistics
- (External/Big Data)

RDSC

Data users

- RDSC mediates between data producers and external users.
- RDSC controls for compliance with data protection regulations.

Modes of Data Access

Off-Site Access		On-Site Access
Email, encrypted (Scientific Use File)	Remote Execution	Guest Stay
Factually anonymous	Weakly anonymous (= confidential)	
Output control		


RDC of the Federal Employment Agency

- The RDC of the Federal Employment Agency in the Institute for Employment Research offers access for non-commercial research to (highly sensitive) admin data (social security records), surveys and their linkages for free.

- Access thru 2 sites in the UK and 6 sites in the US.

- Remote Access via JoSuA (Job Submission Application) with

  - Two modes of output: internal use or publication mode,

  - Internal use mode is treated like a microdata use.

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017
Page 15

German Data Forum: Key Facts

- Advisory council to the federal government

- 16 members: 8 data producers / 8 data users from research

- Development of a research data infrastructure for the social, behavioral, and economic sciences

- Accreditation of 30 research data centres

- Facilitating access to high-quality data

- Result of independent initiatives from within the scientific community

Bender: United States Commission on Evidence-Based Policymaking
13 January 2017

Child and Family Policy
DUKE UNIVERSITY

Increased Demand for High-Quality Research in Education Policy

- Prior to 2000, studies in education policy had been plagued by poor-quality data with small, non-representative samples and no prospective follow-up.

- Era of evidence increased demand for better analysis.

- No Child Left Behind Act increased collection of high-quality data, for accountability purposes. In NC, data collection had started in 1990s with its ABCs program.

CENTER FOR
Child and Family Policy
DUKE UNIVERSITY

Establishment of the
NC Education Research Data Center

- A partnership between Duke University and the NC Department of Public Instruction

- Established in January 2001, renewed through 2021

- Initially funded by Spencer Foundation, now fees

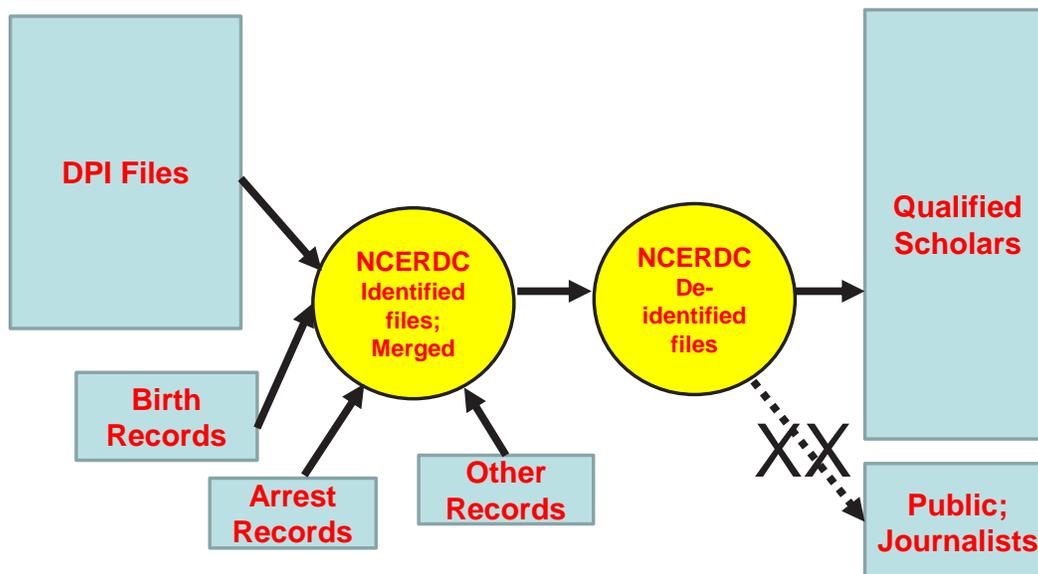
- 375 approved research projects, 50 dissertations
  - Half initiated outside of NC
  - All for research, not for political use or journalism

CENTER FOR
Child and Family Policy
DUKE UNIVERSITY

Basic Terms

- NCERDC acts as agent of NC DPI.
- DPI provides electronic data files to NCERDC.
  - 4,000 files per year; identifiers intact
- Legal authorization: "to improve education of children in NC"
- NCERDC cleans, stores, merges files.
- Researchers apply to receive customized, de-identified data files for a specific study.
- Four-person board establishes policy, ensures data security, and reviews requests.

CENTER FOR
Child and Family Policy
DUKE UNIVERSITY

NCERDC Structure


Data Files in NCERDC

- ➢ Annual student files
    - ➢ 1,459,852 children in 2,592 charter & public schools
    - ➢ Test scores, special ed, graduation, discipline
    - ➢ Teacher and principal credentials; $$$ school information

- ➢ Merged longitudinally back to 1993

- ➢ Can be merged with other files
    - ➢ Birth records, child abuse registry, arrest, Medicaid, higher education
    - ➢ Can create peer context information
    - ➢ Add local context data, such as job losses and natural disasters

Examples

- Evaluate impact of funding for pre-kindergarten program
  - State funding varied (randomly) across 100 counties and 20 years
  - Find that: Children living in well-funded counties at age 4 have higher test scores in elementary school at least through grade 5

- Evaluate impact of lead exposure on student outcomes
  - Find that: Higher lead in housing walls associated w/ lower test scores

- Evaluate impact of middle school on student trajectories
  - 85% of districts have k-5, 6-8, 9-12 system (others have k-6 or k-8)
  - Sixth graders in k-5 system have more substance use infractions
    - Same students have worse outcomes in high school

CENTER FOR
Child and Family Policy
DUKE UNIVERSITY

National Opportunities

- NSF Network co-led by D. Figlio and K. Dodge
  - 60 scholars and state-level ed policy leaders
- Statewide Longitudinal Data Systems (SLDS)
  - > $600 million to states to develop databases
  - Little used for research, to date
- Race to the Top and Early Learning Challenge
- Barriers can be overcome
  - Legal, through statute
  - Data security, through standards
  - Relationships of trust, through incentives and careful use
  - Public will, through leadership

CENTER FOR

Increasing the use of state and local
administrative data for evidence-building
Robert M. Goerge

Presentation to the
Commission on Evidence-Based Policymaking
January 13, 2016

ChapinHall at the University of Chicago
Policy research that benefits children, families, and their communities

Goals for presentation

- Chapin Hall background
- Partnerships with data providers (federal, state and local agencies) to facilitate access to data
- Importance and uniqueness of state and local data for federal evidence and policy purposes
- Discuss a pilot project to understand the demand for linkage to federal data sources, methods and use cases

ChapinHall

Chapin Hall at the University of Chicago

- Provide public and private decision-makers with rigorous data analysis and achievable solutions for improving the lives of children, youth and families

- Our audiences are policymakers and funders, government and private agency leaders, and researchers

- Our ongoing partnerships with public systems, institutions, organizations, and programs are a core strategy to achieve our mission

ChapinHall

Data that supports large scale evidence-building

- Focus on:
  - Linked administrative datasets or administrative data linked to survey data
  - Microdata on individual, families or providers (organizations or individuals) with personally identifiable information (PII)
  - "Universe" data or data on the entire population so that sub-state or sub-group analyses can be done
  - Historical data to do longitudinal analysis
  - Going to scale!

ChapinHall

Need a partnership with the data providers

- Most federal, state and local agency leaders and policymakers don't want to be "researched"
- **It's their data!! The vast majority (if not all) do not have to provide their data to researchers**
- Therefore, they need to see the benefit in providing access to their data to researchers OR to other government agencies
- They need to feel confident that they will be included and not be treated at arm's length in any specific research endeavor
- This is a different way of how research has been done in the past

ChapinHall

The partnership

- What is different in order to build a relationship
  - Need to include input from agency staff
  - Need participation from agency staff in the substance and design, but not the doing of it
  - Need them to review results before external audiences see them
  - Need them to have a chance to respond through actions or words to the research
- Only with such a partnership will they perhaps see a benefit and provide their data **ChapinHall**

Why administrative data from states

- Many federal programs implemented by states report microdata to federal agencies.
- These data make up many of the federal datasets
- **This federal data, however, is very different in format and content** from the data that is maintained and analyzed by the state agencies themselves or by external parties that are provided the state's data
- The state data is what should be put into an administrative data clearinghouse
- Data may be transformed, de-identified, sampled or be restricted in its use when sent to the federal agency

ChapinHall

Examples of federal datasets that are close, but richer when accessed from the state

- UI (Unemployment Insurance) quarterly wage data at the Census
  - All states, no sampling, up to date
  - Common format
  - However, not all states allow it to be used for non-LEHD purposes
- Adoption and Foster Care Reporting System
  - All states, no sampling, up to date
  - Common format
  - However, no identifiers, 6 month summaries

ChapinHall

Transformed data example - TANF

- Temporary Assistance to Needy Families
- HHS Office of Family Assistance receives an <u>annual</u> summary record of characteristics, benefits, services and outcomes of individual and families on TANF from each state in a specific format so that the data is comparable across states and can be used for national reporting purposes
- Universe data from 30 states

ChapinHall

De-identified data – Child care subsidies

- Child Care Development Fund - CCDF
- Often the largest work support program in the state
- Recently, the reauthorization of the CCDF program removed the requirement of providing PII (Social Security Numbers) to HHS for parents and children participating in this program

ChapinHall

Sampled data – SNAP Quality Control

- Data for "conducting quality control (QC) reviews of Supplemental Nutrition Assistance Program (SNAP) cases"
- Statistical sample
- While other data could be linked to this sample, the size of the sample prohibits sub-state analysis
- Cannot look at SNAP receipt as an outcome

ChapinHall

Restricted data - NDNH

- National Directory of New Hires contains
  - New Hires
  - Quarterly Wage (QW)
  - Unemployment Insurance (UI)
- Researchers can only use if it is de-identified, or
- "for research purposes found by the Secretary of Health and Human Services (HHS) to be likely to contribute to achieving the purposes of Part A or Part D of the Social Security Act."
- 2 years of data is maintained by HHS

ChapinHall

"Raw" state administrative data is richer

- Data pulled from state information systems for either their own analysis or analysis by external parties (Chapin Hall, CARRA …)
- Contains state-specific variables (fields) and identifiers necessary for the state to **implement** the program
- Richness of sub-year variation, non-summarized data and the ability to calculate and transform to fit research question

Chapin Hall

Multi-state studies with state data

- If we are not going to use federally help data which is comparable, what had to be done?
- Data has to be made comparable
  - Often little or no metadata
  - Requires researchers have significant subject matter and local service system expertise
- However, the richness of a particular state's data can enhance the analyses
  - A state may have more historical data

Chapin Hall

Using Linked Data to Advance Evidence-Based Policymaking

- Demonstrate an efficient way to link state and local data to Census-held data to answer important questions while protecting privacy
- Create compelling use cases for strengthening the Census linkage infrastructure to serve multiple levels of government
- Inform Federal, state, and local strategies for facilitating data linkage across programs
- Supported by the Laura and John Arnold Foundation
- CARRA is a collaborator with CH on this project
- Distributed an RFP for research projects linking 'PI-held' data to data held by the Census Bureau

ChapinHall

Response to RFP

- 17 responses to the call for full project proposals
- 25 responses to the call for letters of interests
- Individuals and organizations ranged from researchers in state and local government agencies, local and national advocacy organizations, research organizations, and universities
- Less than a handful were below par

ChapinHall

Primary interests for Census held data

- Employment
- Post-secondary education
- Public benefits: Medicaid, Medicare, SSI, SNAP, TANF, HUD
- Decennial Census, American Community Survey
- Topics included:
  - long-term follow-up of welfare reform experiments;
  - study of evicted households;
  - long-term follow-up of students K-12
  - public aid for post-secondary education
  - health outcomes over the life course

ChapinHall

Data being brought by investigators

- County-level integrated human services data
- County court records
- State birth certificates
- State post-secondary records
- State juvenile justice youth population
- State/county public benefit receipt
- K-12 student data
- Applications for state and federal financial aid for college

ChapinHall

Appendix A: Proposal Topics

- Education: preschool, K-12, post-secondary
- Employment
- Minimum wage
- Housing: homelessness, eviction, mobility
- Criminal justice
- Health
- Lead exposure
- Suicide
- Disaster preparedness
- Intergenerational poverty
- Multi-system families
- Child support
- Eligibility determination
- Food insecurity/SNAP
- Refugees
- Immigration
- Predictive analytics
- Taxation
- Federal regulation

ChapinHall

Appendix B: Proposal Methodologies

- Descriptive studies
- Needs assessment
- Eligibility/program take-up
- Long-term follow-up of RCTs
- Quasi-experimental studies
- Regression discontinuity
- Propensity score matching
- Difference-in-difference
- Longitudinal analysis
- Life course/trajectory models
- Policy analysis
- Predictive analytics
- Data linkage/warehouses
- Cluster analysis
- GIS/mapping

ChapinHall

Supporting Delivery System Transformation Through Data Integration and Analytics

David Mancuso, PhD • January 13, 2017

DSHS | Research and Data Analysis

WASHINGTON STATE DEPARTMENT OF SOCIAL AND HEALTH SERVICES   1

Analytics in the State Social and Health Service Environment

▸ **Medicaid expenditures are disproportionately concentrated in populations with multiple comorbid physical and/or behavioral health conditions**

▸ **Overall social and health service program costs are driven by a relatively small number of persons with overlapping risk factors and service needs,** often exacerbated by extreme poverty, trauma, mental illness, substance use disorders, cognitive limitations or functional impairments

▸ **High-cost clients often have significant social support needs** such as the need for economic, housing or employment support, or interventions to reduce the risk of criminal justice involvement

▸ **Increased demand to use state agency data to directly inform care**

▸ **Increased emphasis on quality/outcome measurement and value-based payment structures**

DSHS | Research and Data Analysis

WASHINGTON STATE DEPARTMENT OF SOCIAL AND HEALTH SERVICES   2

Data Sources in the DSHS Integrated Client Databases

Slide 3: A diagram titled "Data Sources in the DSHS Integrated Client Databases" showing external and internal data sources connected to the Washington State Department of Social and Health Services Integrated Client Databases.

External data sources (top):
- **Education Research Data Center** (*De-identified*): School Outcomes Preschool – College
- **Washington State Patrol**: Arrests
- **Administrative Office of the Courts**: Charges, Convictions
- **Department of Corrections**: Incarcerations, Community Supervision
- **Health Care Authority**: Dental Services, Medical Eligibility, Hospital Inpatient/ Outpatient, Managed Care, Physician Services, Prescription Drugs
- **Employment Security Department**: Hours, Wages
- **Department of Health**: Births, Deaths
- **Department of Commerce**: Housing Assistance, Emergency Shelter, Transitional Housing, Homeless Prevention and Rapid Re-housing, Permanent Supportive Housing
- **Housing and Urban Development** *Public Housing Authority*: Public Housing, Housing Choice Vouchers, Multi-Family Project-Based Vouchers

External / **Internal**

WASHINGTON STATE Department of Social and Health Services **Integrated Client Databases**

Internal (bottom):
- **DSHS Aging and Long-Term Support**: Nursing Facilities, In-home Services, Community Residential Services, Functional Assessments
- **DSHS Children's Services**: Child Protective Services, Child Welfare Services, Adoption, Adoption Support, Child Care, Out of Home Placement, Voluntary Services, Family Reconciliation Services
- **DSHS Developmental Disabilities**: Case Management, Community Residential Services, Personal Care Support, Residential Habilitation Centers and Nursing Facilities
- **DSHS Behavioral Health** *Mental Health and Substance Abuse Services*: Assessments, Detoxification, Opiate Substitution Treatment, Outpatient Treatment, Residential Treatment, Child Study Treatment Center, Children's Long-term Inpatient Program, Community Inpatient Evaluation/ Treatment, Community Services, State Hospitals
- **DSHS Economic Services**: Food Stamps, TANF and State Family Assistance, General Assistance, Child Support Services, Working Connections Child Care
- **DSHS Juvenile Rehabilitation**: Institutions, Dispositional Alternative, Community Placement, Parole
- **DSHS Vocational Rehabilitation**: Medical and Psychological Services, Training, Education, Supplies, Case Management, Vocational Assessments

DSHS | Research and Data Analysis

How do we use integrated administrative data?

▶ **Policy analysis**
– Example: describing the link between ED utilization and prescription narcotic drug-seeking behavior

▶ **Program evaluation**
– Example: evaluating the impact of SUD treatment on health care costs and criminal justice involvement

▶ **Predictive modeling and clinical decision support**
– Example: dynamic patient-level risk scoring to identify high-risk dual Medicare/Medicaid enrollees for engagement in Health Homes and to support direct patient care

▶ **Performance measurement**
– Example: monitoring health care quality, utilization and "social determinant" outcome measures

Predictive Modeling and Clinical Decision Support
Achieving Profound Savings Supporting Direct Client Care

Washington State's **PRISM predictive modeling and clinical decision support application** supports a Medicare-Medicaid Dual Eligible Demonstration that produced $**21.6 million in Medicare savings** in its first year

Lessons Learned: Keys to Washington State's Success

▸ **Senior agency leadership recognizing potential for integrated data analytics to support improved service delivery**

▸ **Maintaining connection between analytic staff and program operations**

▸ **Supporting service delivery systems rather than "academic" interests**

▸ **Maintaining a commitment to analytical integrity to build trust with other agencies, the Legislature, and external stakeholders**

▸ **Commitment to engage data owners in timely review of sensitive results before public release**

▸ **Initial development occurred within a single large umbrella agency**

▸ **Integration of new sources dependent on external partner agency interest**

Lessons Learned: Data Integration Challenges

▸ **Obtaining the necessary financial resources**

▸ **Establishing effective cross-agency governance structures**

▸ **Building and maintaining trust among data owners, including addressing privacy concerns**

▸ **Conscripting time from state agency subject matter experts**

▸ **Maintaining support of constantly evolving state agency leadership**

▸ **Maintaining an analytical data infrastructure in a constantly evolving policy, program and IT system environment**

▸ **Recruiting and retaining internal staff with analytical expertise, or finding external contractors with relevant subject matter expertise**

▸ **Data are plentiful – analytical skills informed by policy and program expertise are scarce**

A Public Engagement Approach to Establishing Statewide Longitudinal Data Systems

Dr. Domenico "Mimmo" Parisi

Professor of Demography and Applied Statistics
Executive Director, National Strategic Planning and Analysis Research Center

nsparc
NATIONAL STRATEGIC ▮ PLANNING & ANALYSIS RESEARCH CENTER

What is a Statewide Longitudinal Data System (SLDS)?

An SLDS allows for the alignment of administrative data from multiple sources to examine and improve education, workforce, and economic outcomes along the entire education and workforce lifecycle of individuals and programs.

nsparc
NATIONAL STRATEGIC ▮ PLANNING & ANALYSIS RESEARCH CENTER

Data Lifecycle

Providers

Management
- Acquisition
- Curation
- Alignment

Users

Data-centric Approach

- "Begins with data…ends with data"

- Focused on technical issues - acquisition, curation, and alignment of data.

The Public Engagement Approach

- Begins with a common understanding of the **value of data**

- Focus on creating a **common understanding of the value of data** between data providers and data users.

Providers

Users

Public Engagement: Data Providers

Providers

Who are the data providers?

- Education: Pre-K, K12, Career Technical, and Higher Education

- Workforce: ES/UI, TANF/SNAP, Ex-Offender programs, Internships, Wage Records

nsparc
NATIONAL STRATEGIC ▌ PLANNING & ANALYSIS RESEARCH CENTER

Public Engagement: Data Access

Who will use the data?

- Researchers and Scientists
- Policymakers
- Administrators
- The Public
- Economic Developers

Users

Public Engagement: Data Management

Management
- Acquisition
- Curation
- Alignment

- **Data Governance**—ensuring privacy and confidentiality and establishing common rules guided by a common understanding of the value of data.

- **Data Security and Expertise**—establishing a center of excellence for storage, processing, and analysis.

Capacity

lifetracks.ms.gov

U.S. Department of Education created multi-year SLDS grants that were designed to support design, development, implementation, and expansion of longitudinal data systems at the state level.

Sustainability

- Show Value - demonstrate that people are using the system to:
  - Improve education and workforce outcomes
  - Help avoid costs in the implementation of education and workforce programs

- Leverage - A data tool becomes an economic development tool (e.g., Workforce on Demand powered by Mississippi Works)

- Legislative and Executive Support

Questions

Dr. Domenico "Mimmo" Parisi

Professor of Demography and Applied Statistics

Executive Director, National Strategic Planning and Analysis Research Center

The National Vital Statistics System

Charles J. Rothwell

Director, National Center for Health Statistics

Presentation for the
Commission on Evidence Based Policy Making
January 13, 2017

National Center for Health Statistics

Purpose and Use for Vital Records

- **Civil Registration: permanent legal record of vital events registered and processed by vital records offices**

- **National Security: protect against fraudulent use; used for proof of citizenship; birth certificates used by SSA to generate Social Security numbers, by State for passports**

- **Public Health: surveillance, monitoring trends, identifying emerging issues**

Background

- 1893 International List for Causes of Death

- 1907 Model Legislation for states on vital registration

- 1933 NAPHSIS established - all states and DC adopted laws consistent with Model legislation

- 1967 and beyond: NCHS developed automated coding system and software

- Today: Electronic registration of vital events

Registration of Vital Events

- Registration of births and deaths is *not* a Federal activity – the legal authority resides with the states and jurisdictions

- The US has 57 independent registration areas that provide the permanent legal record for births and deaths:
  - 50 States
  - 5 U.S. Territories
  - New York City
  - Washington, DC

Federal Role in Vital Statistics

- **Public Health Service Act, Section 306(h)(1):**

  - **NCHS mandated to collect data annually *from the records of births and deaths in registration areas***

  - **Secretary of HHS shall encourage the collection of detailed data on ethnic and racial populations**

  - **States and registration areas shall be paid by the Secretary the Federal share of its reasonable costs**

Vital Statistics Cooperative Program

- **Oldest Federal – State data sharing partnership**

- **NCHS contracts with 57 jurisdictions**

- **Collaboration results in the use of standard certificates, classifications (ICD), coding rules, and reporting elements**

- **Records are sent to NCHS:**

  - **NCHS provides quality review and mortality coding**

  - **NCHS returns electronically coded records in 1 day, returns manually coded records in 10 days**

Robust Collaboration

- NCHS provides funding, training, technical assistance

- Records sent to NCHS must meet certain requirements for coding rules and coding structures:

  - NCHS provides quality review and mortality coding

  - NCHS returns electronically coded records in 1 day, returns manually coded records in 10 days

- Result: NCHS produces national statistics based on 6 – 7 million records of births and deaths each year and quarterly estimates on major outcomes

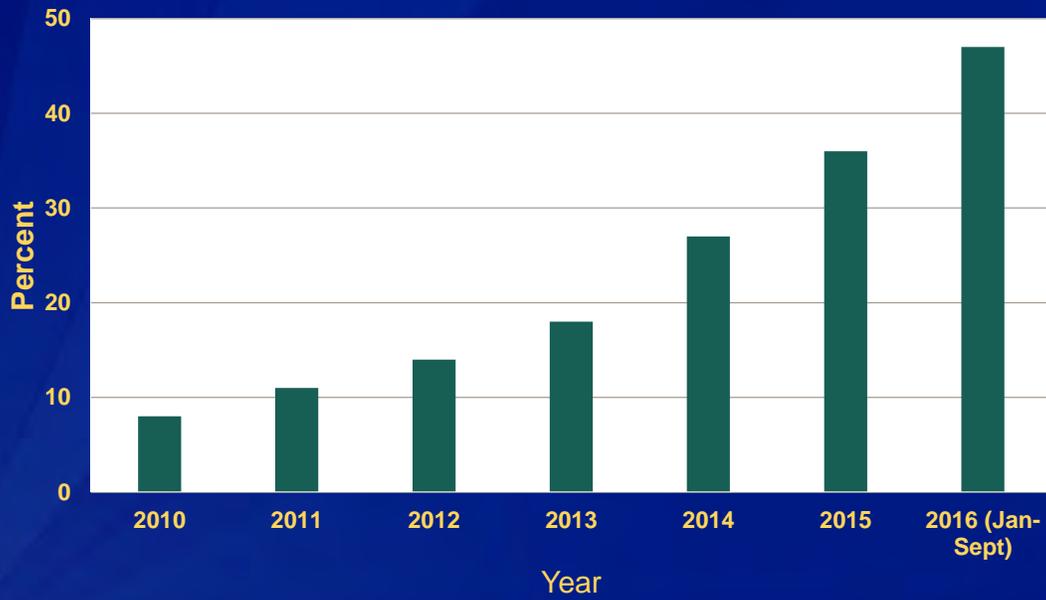
Timeliness

- Improved timeliness = increased value

- Substantial improvements in timeliness for:

  - Receipt of records by NCHS from jurisdictions
  - Return of records to jurisdictions from NCHS
  - Release of data by NCHS

- Timeliness of mortality data differs by cause of death – important for mortality surveillance

Mortality Records Received by NCHS within 10 Days of the Date of Death


Access to Information for the Public and Researchers

Products and Dissemination

- **Data Briefs**

- **National Vital Statistics Reports**

- **Vital Statistics Rapid Release Program- Quarterly**
  - **Natality estimates for birth rates, delivery method, preterm, other Gestational age**
  - **Mortality estimates for 15 leading causes of death plus drug overdoses, falls (age 65+), HIV, homicide, and firearms**

NVSS Vital Statistics Rapid Release

Additional Resources

Crude and age-adjusted death rates for all causes: United States, 2014–Quarter 2, 2016

- For 2016, the crude death rate for all causes was 894.7 deaths per 100,000 population for the first quarter and 822.3 for the second quarter. The rate for the first quarter decreased from 930.3 in the first quarter of 2015, and the rates for the second quarter were similar in 2015 (823.5) and 2016. The age-adjusted death rate decreased from 2015 to 2016 for the first quarter (769.1 and 801.4, respectively) and for the second quarter (705.3 and 716.8, respectively).
- The crude death rate for all causes for the 12-month period ending with the second quarter of 2016 was 836.1 per 100,000 population, a decrease from 843.0 for the same period of 2015. The age-adjusted rate remained lower in 2016 than in 2015 for the comparable period (720.2 and 736.4, respectively).
- In 2015 (12-month period ending with the fourth quarter of 2015), the crude death rate for all causes was 844.0 per 100,000 population, an increase from 823.7 in 2014. The age-adjusted death rate remained higher in 2015 than in 2014 (733.1 and 724.6, respectively).

Crude death rates for all causes:
United States, Quarter 4, 2014–Quarter 2, 2016

- 3-month period
- 12 months ending with quarter

Access to Data

Release and Access Policy

National Center for Health Statistics

National Vital Statistics System

National Vital Statistics System

CDC > NCHS > National Vital Statistics System

NCHS Data Release and Access Policy for Micro-data and Compressed Vital Statistics Files

This document outlines NCHS/Division of Vital Statistics (DVS) policy on the release of and access to vital statistics micro-data for births, deaths, fetal deaths, linked birth/infant death, and matched multiple births. Given changes in state laws and policies on confidentiality with respect to the re-release of vital registration data, NCHS has revised its micro-data release and access policy to comply with state requirements effective with the 2005 data year.* The DVS revised policy as outlined here is consistent with CDC and NCHS goals to make data available as widely as possible while protecting respondent confidentiality, assuring data quality, and conforming to state laws and regulations on re-release of vital statistics data.

Data available to the public:

A. Public-use micro-data file content:

The release of public-use data generally coincides with the publication, or follows soon after, of DVS final annual reports on births, deaths, fetal deaths, and linked birth/infant death. DVS also publishes preliminary reports, but these are based on incomplete data, do not constitute a final data file, and are not released as micro-data. Final report publication dates vary from year to year following receipt and processing of complete data from the states and other registration areas.

Left sidebar navigation:
- National Vital Statistics System
- About NVSS

- Publications and Information Products
- Training
- Birth Data +
- Mortality Data +
- Fetal Death Data
- Linked Birth and Infant Death Data
- Marriages and Divorces +
- National Maternal and Infant Health Survey
- National Mortality Followback Survey +

Restricted Data

Requests must be reviewed by NAPHSIS and NCHS

NAPHSIS Review:

- Researchers may request customized micro-data files containing geographic data on States and counties

- Some states have their own laws, regulations or policies restricting access and prohibiting release of certain items

- NAPHSIS must review and approval all requests for custom micro-data prior to review by NCHS

Restricted Data continued

NCHS Review:

Federal Privacy and Confidentiality Requirements:

- Public Health Service Act § 308(d) *Information must be used for the purpose for which it was supplied, and no identifiable information may be published or released without consent*

- Following approval from NAPHSIS and NCHS, researchers must sign a Data Use Agreement on terms and use

- Data for approved projects will be provided at no cost

National Death Index

- Centralized database of death record information

- Assists investigators in the identification of study participants who have died

- Records are available from 1979 – 2015

- Available to investigators solely for statistical purposes in medical and health research

INTRODUCTION

- Opening access to confidential government microdata for research in France : a 2 steps process
  - Access to official confidential microdata (census and surveys) 2008
  - Access to administrative data in France since 2014-2016

- Administrative data under a rather dispatched organisation and legal frameworks

- However organization of access to administrative data has benefited from the centralized process and infrastructure set up for access to official microdata
  - The approval process: *Comité du secret statistique*
  - The remote access infrastructure: *CASD*

GENES | GROUPE DES ÉCOLES NATIONALES D'ÉCONOMIE ET DE STATISTIQUE   3

KEY POINTS IN THE LEGAL FRAMEWORKS FOR ADMINISTRATIVE DATA

- Under various legal frameworks
- Started by changing specific legal frameworks one by one
  - 2014 Tax data
  - 2015 Medico-administrative data

- Extension to all administrative data - 2016
  - By clearing of the responsibility of producers regarding professional secrecy
    - NB Central Bank data depend on the European framework: Banque de France opened an on-site access
- Last step: Facilitate linkage on the basis of the NIR (National Identity Number) for statistical and research purpose - 2016

GENES | GROUPE DES ÉCOLES NATIONALES D'ÉCONOMIE ET DE STATISTIQUE   4

The overall process

- A researcher can ask any data under the legal perimeter

- The researcher contacts the producer to check data fit the research project

- Approval process via independent authorities
    - + Agreement of the producer (see above)

- Remote access process: CASD acts as third party between the producers and the users

GENES   GROUPE DES ÉCOLES NATIONALES D'ÉCONOMIE ET DE STATISTIQUE   5

Governance (1): The approval process

- *Comité du secret statistique*
    - An independent authority chaired by a lawyer
    - Representatives of the Parliament
    - Representatives of the Unions
    - Representatives of the producers
    - Representatives of *CNIL* (National Authority in charge of privacy protection) and of Archives de France (National Archives)
    - 2 Representatives of researchers (proposed by the ministry of research in consultation with the Data Archives infrastructure)

- Provides an advice based on the research project and public interest
    - + Agreement of the producer
    - + Formal approval from the Authority in charge of privacy protections if personal data (CNIL)
    - + Formal approval from the National Archives

- Does not require accreditation of institutions

- Open to researchers from European Union

GENES   GROUPE DES ÉCOLES NATIONALES D'ÉCONOMIE ET DE STATISTIQUE   6

Governance (2): The secure access CASD

- A department of GENES, an independent institution of high education
  - Representatives of Ministry of research and Ministry of finances on board

- CASD governing board includes 5 Founding Research institutions + Data archive infrastructure + INSEE

- A Scientific Advisory Board
  - 15 members from France and other countries
  - Researchers from various disciplines, IT and methodologists + a representative of INSEE, Eurostat invited

GENES | GROUPE DES ÉCOLES NATIONALES D'ÉCONOMIE ET DE STATISTIQUE 7

The access process: CASD Role

- Acts as third party for secure access between data producers and researchers
- Equal access for all researchers (no specific access for the founding institutions)

  - Preparation and transfer of data with the producers
  - Metadata harmonised under DDI
  - Establish contracts with researchers (responsibility of the researcher)
  - Enrolment and training of researchers
  - Secure remote access to data
  - Outputs checked before export or automatic exports depending on agreements with data holders
  - Can act as third party for data linkage

GENES | GROUPE DES ÉCOLES NATIONALES D'ÉCONOMIE ET DE STATISTIQUE 8

CASD TECHNOLOGICAL SOLUTION
A distributed architecture designed by GENES IT department

- **High security**
  - An integrated system
  - Physical and logical security including a biometric strong authentication
  - No possibility to download data

- **Usability for the researchers**
  - Remote access: researchers can work from their university with their SD-Box (+ access card +biometric control)
  - Researchers can see the data
  - A research environment for working and writing

- **Flexibility**
  - Easy to install and deploy in the pre-existing researchers' institutions environment: no compatibility issues, no test to run

GENES

CASD : an integrated system

:

- A central IT infrastructure highly secure
- The SD-Box : the only way to access the central infrastructure. They are sent to users.

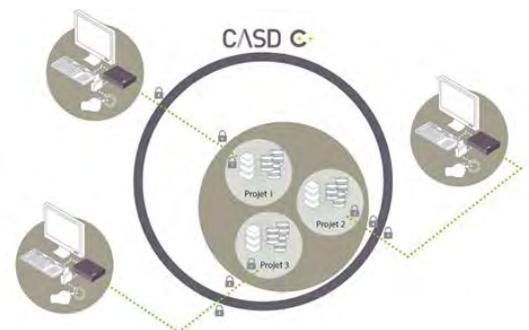
GENES

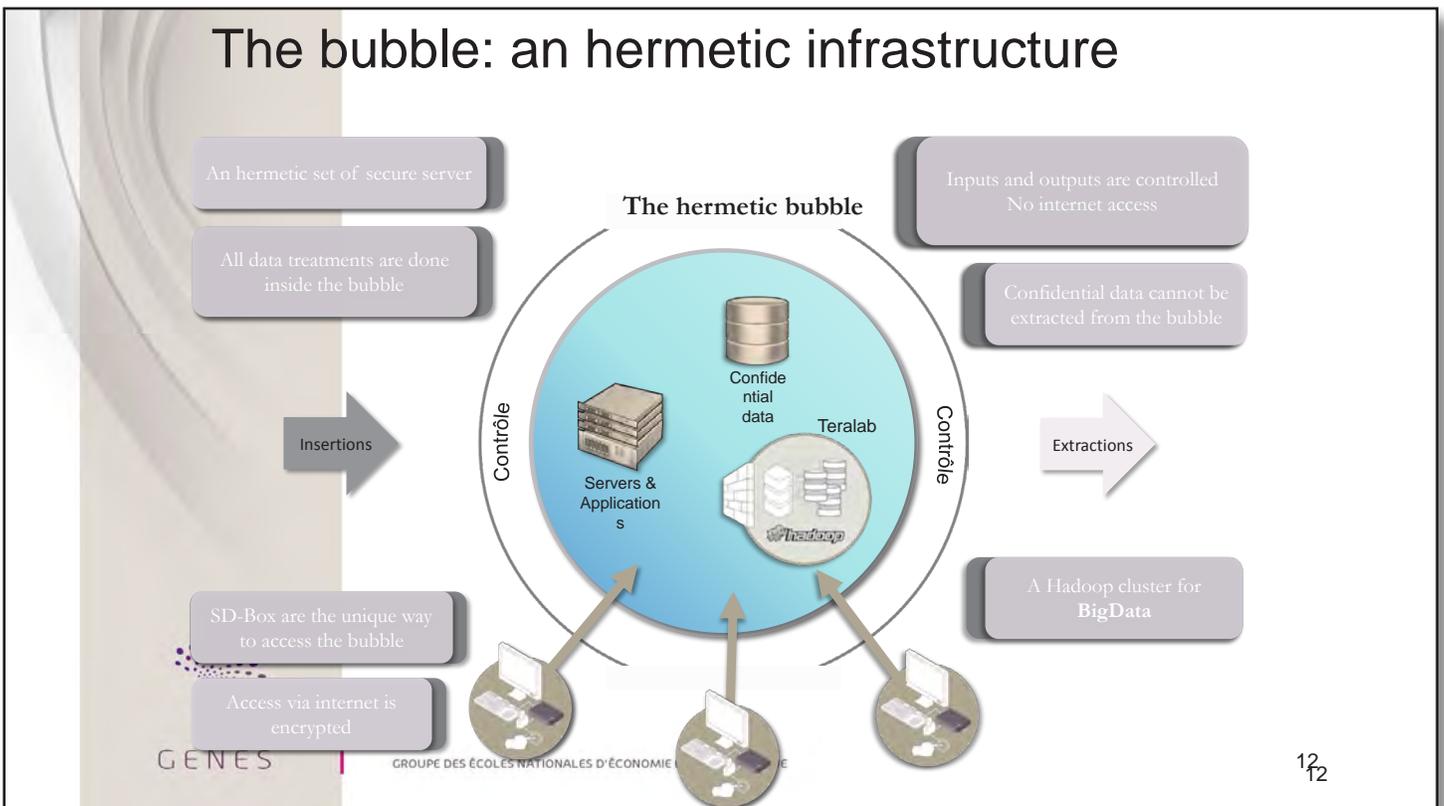
GROUPE DES ÉCOLES NATIONALES D'ÉCONOMIE ET DE STATISTIQUE

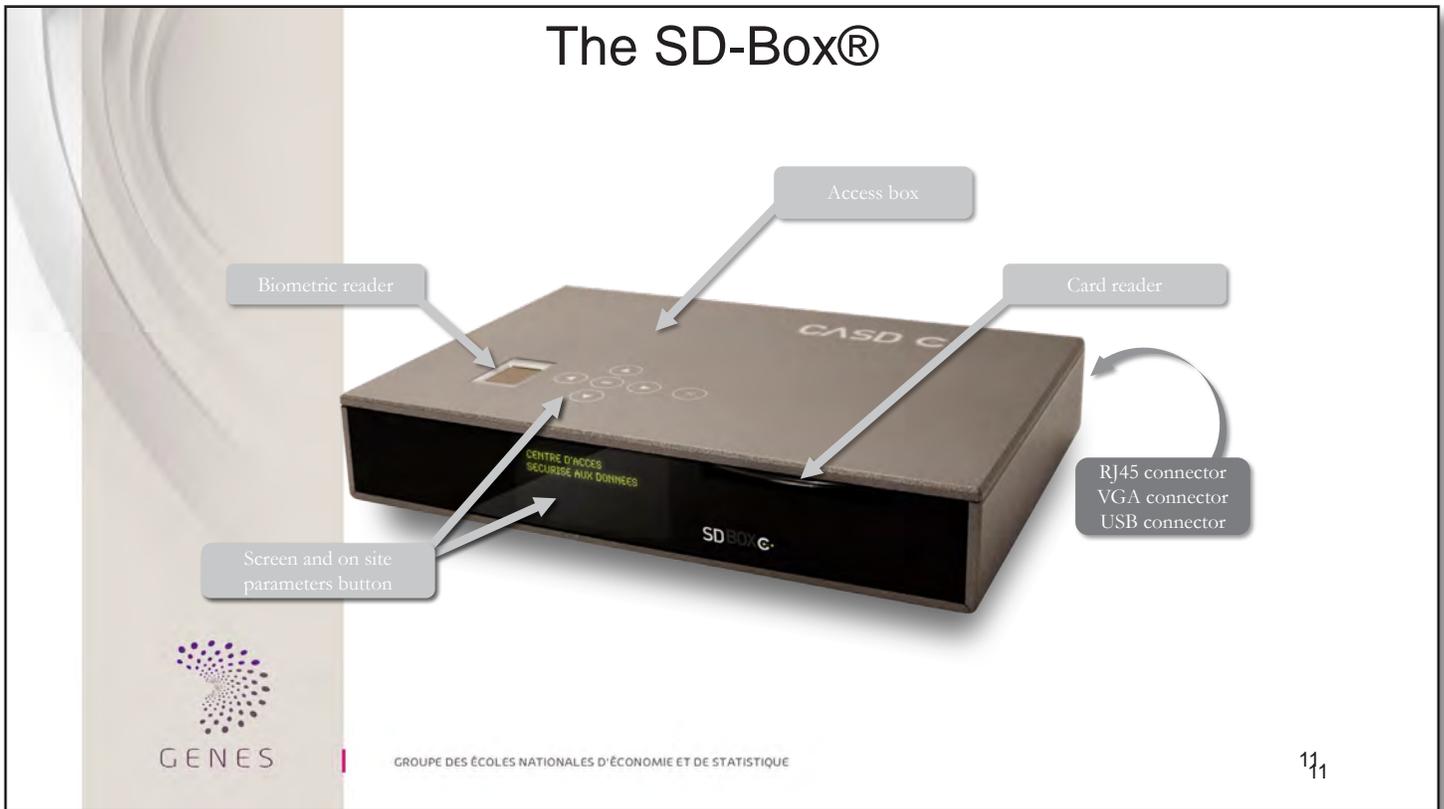
La SD-Box.

10

The SD-Box®

The bubble: an hermetic infrastructure






CONCLUSION

The technological solution:

- **From the researcher's perspective:** everything is at hand, data, a well-known environment with all software, storage, computing power, also designed for big data
- **From the security perspective:** everything happens at CASD in the bubble with no dependence of other systems that may compromise security, no possibility to download data
- **From a service perspective (installation, supervision, assistance)** SD-Box are identical, monitored, configured, updated remotely by CASD, easy to replace
- **From a cost perspective:** the solution integrates software and services. SD-Box can be shared by several teams

The overall unified system :

- **A central point for access with harmonised criteria for approval, same procedures for access and possibility to easily work with datasets from different administrations**

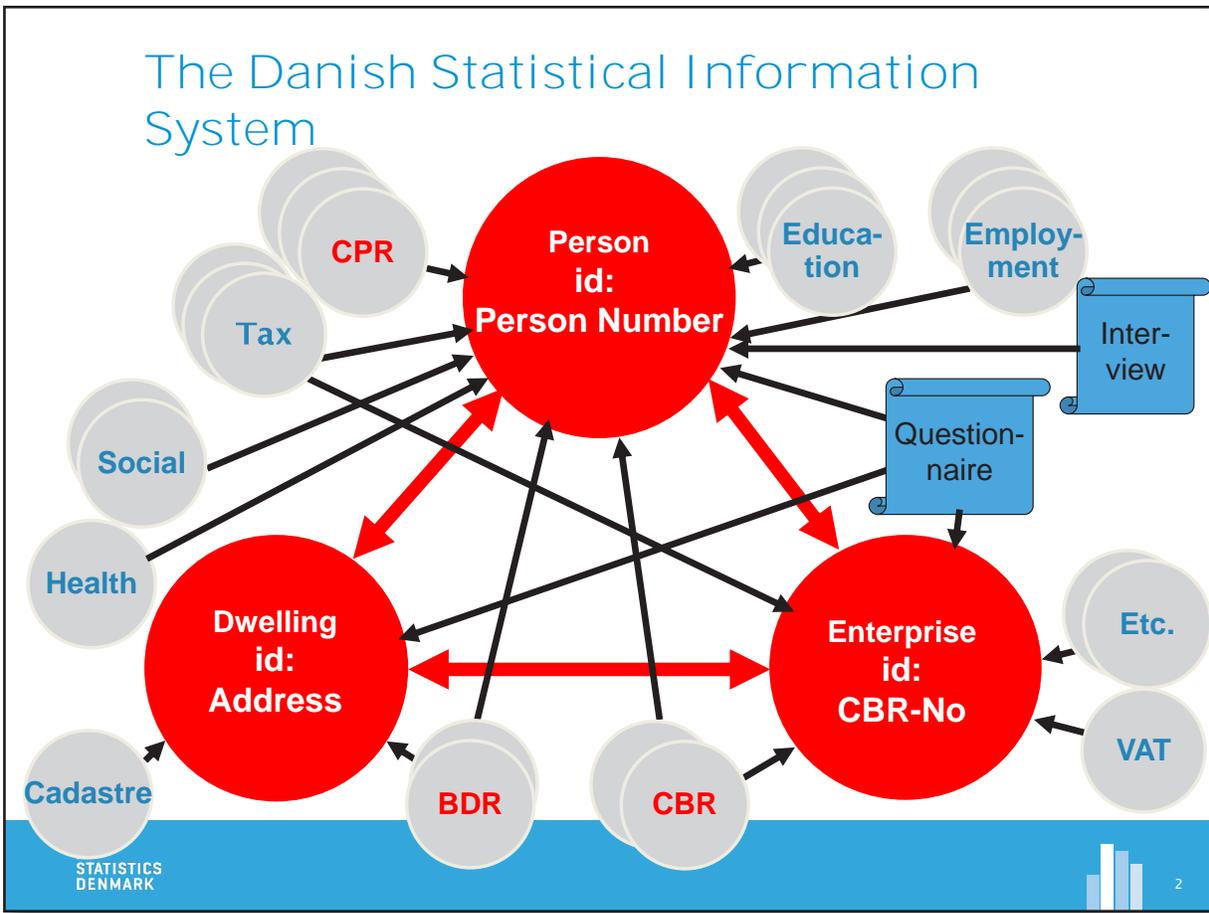
The Danish Statistical Information System


Demographic data

- Longitudinal demographic information from 1980 onwards
  - E.g. immigration and emigration
  - Marriages and divorces
  - Births and deaths (causes of death)
  - Family formation
  - References between parents and children

STATISTICS
DENMARK

3

Health data

- National Register of Patients
  - Hospitalizations and diagnoses etc. from 1977 onwards

- Register of Medicinal Product Statistics
  - Total population data from 1995 – prescripted medicines

- Health insurance
  - Contacts covered by the public health insurance e.g. visits to a doctor
  - 1992-

STATISTICS
DENMARK

4

Income, education etc.

- Income statistics, income of the year 1980-
  - Now E-income, monthly employment figures

- Cohesive social statistics / Public beneficiaries
  - Recipients of transfer benefits
  - 1984 -

  - Highest completed level of education (status 1 January) 1981-
  - Integrated Student Register (longitudinal data)
    - 1973-
    - detailed educational training programs incl. interrupted training programs

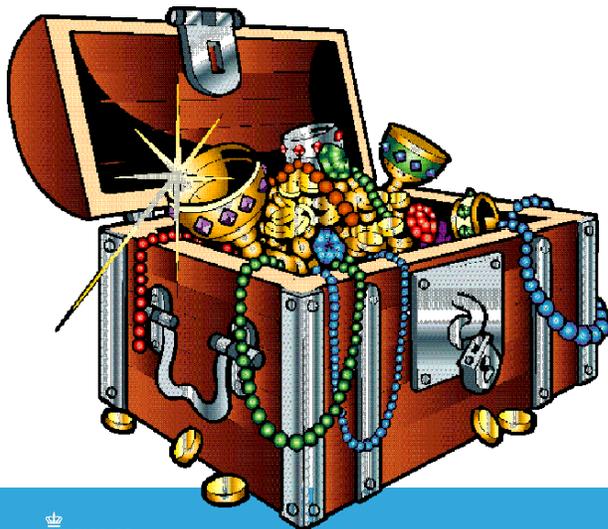
STATISTICS DENMARK

5

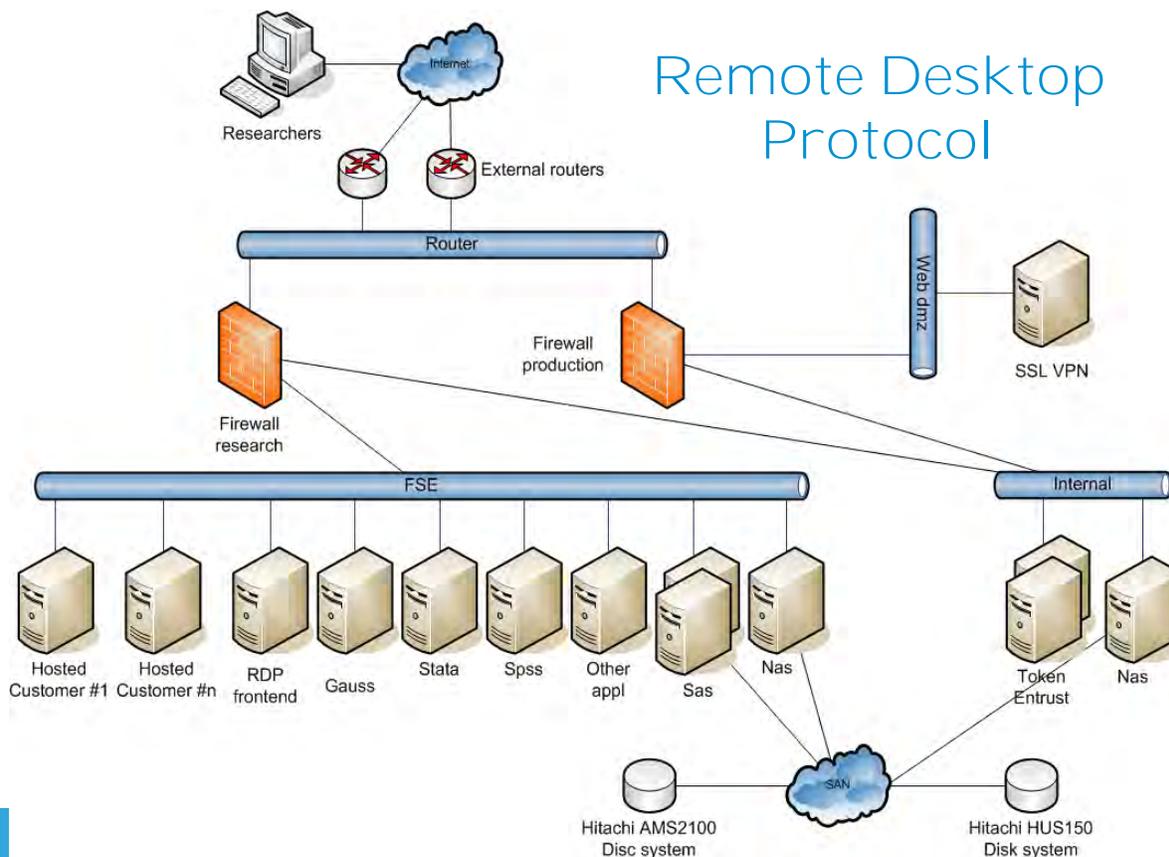
Labourmarked, business register etc

- IDA – Integrated Database for Labour Market Research
  - IDA linkages (persons - workplaces – employees)
  - 1981-

- Central Business Register (enterprises and accounts)

- Central Register of Buildings and Dwellings (BBR)
  - and real estate registers (owners of real estate)


STATISTICS DENMARK

6


Autorization:
Who can access microdata?

- Only researchers or analysts from specially authorized institutions (stable institutions with a responsible manager and with a number of researchers/analysts)

- Private companies can be authorized and have access if they have a stable research environment

STATISTICS DENMARK

9

Limitations to Data access

- Only access to data according to a "need to know" principle

- Statistics Denmark may reduce the data applied for (samples and grouping)

STATISTICS DENMARK

10

Data Security

Users
- The head of the research institute signs Authorization: Responsibility & supervision
- The researcher signs declaration to follow rules for access to micro data
- Possible to close an authorization if rules for access to micro data is not followed

Data
- All data will be **de-identified**
- Micro data stays at Statistics Denmark on special dedicated servers
- The research server are separated from the statistical production at Statistics Denmark

STATISTICS DENMARK

11

Data Security

Output

- Output with statistical results is forwarded only by e-mail

- Researchers are not allowed to print individual records and cannot download data or results

- Mail is logged

- Output is randomly checked by SD

STATISTICS DENMARK

12

DATA FLOW: PROCESS FOR REGISTERING AND REPORTING VITALS

The process for registering vital events, reporting data to NCHS, and releasing vital statistics is complex, with many steps performed by many actors from start to finish. When an event occurs, data providers—typically hospitals for birth information and funeral homes, physicians, and coroners for death information—submit birth and death data to the vital records jurisdictions so that the vital event can be reviewed, edited, processed and officially registered. The jurisdictions are then responsible for maintaining registries of such vital events and for issuing certified copies of birth and death records.

BIRTH

- Hospital reports to vital records office (VRO)

- VRO reviews data for quality
  - If needed, VRO follows up with hospital

- VRO where birth occurred shares birth record with mother's state of residence, if different

- VRO submits birth data to NCHS

- NCHS reviews data for quality
  - If needed, NCHS sends back to VRO
  - If needed, VRO follows up with hospital

- VRO conducts final year end edits and submits complete, final data to NCHS

- NCHS conducts final data quality review
  - If needed, NCHS sends back to VRO

- NCHS and vital records jurisdictions each release aggregate non-identifiable vital statistics data

There are many permutations of registering and reporting vitals; the process depends on where and how an event occurs, which determines who initiates the process. This flow chart is meant to depict the most typical scenarios for births and deaths.

DEATH

Depending upon the circumstances of the death - natural causes or questionable circumstances - the death certificate is initiated by:

- Funeral home to supply personal and demographic information

OR

- Medical official (e.g., certifying physician, coroner, or medical examiner) to supply the cause and manner of death and other medical information

- Funeral home completes death certificate with demographic information about the decedent and provides to VRO

- VRO reviews data for quality
  - If needed, VRO follows up with funeral home and/or medical official

- VRO shares death record with state of residence if person died out of state and with the state of birth so that state may mark the birth record "deceased"

- VRO submits data to NCHS

- NCHS reviews data for quality
  - If needed, NCHS sends back to the VRO
  - If needed, VRO follows up with funeral home and/or medical official

- VRO conducts final year end edits and submits complete, final data to NCHS

- NCHS conducts final data quality review
  - If needed, NCHS sends back to VRO

- NCHS and vital records jurisdictions each release aggregate non-identifiable vital statistics data

Economics of Evidence:
Public Sector Problems and Solutions

Daniel L. Goroff
Vice President and Program Director, Alfred P. Sloan Foundation

Informed by grantees such as: Cynthia Dwork, Aaron Roth, Adam Smith, John Abowd, Jerry Reiter, Sahlil Vadhan, Micah Altman, Gary King, Alessandro Acquisti, and at ICPSR, IQSS, BITSS, COS, ADRN…

Opinions are not necessarily theirs or those of the Sloan Foundation.

What Problem are We Trying to Solve?

1. Public Goods Problem for Open Data

    Due to free riding and financial challenges.

2. Externality/Spillover Problem for Evidence

    Due to inevitable validity and privacy leakage.

3. Transaction Costs Problem for Researchers

    Due to lack of trusted intermediary platforms.

Data & the "Public Goods" Problem

- Open data is a "public good," technically speaking.

- I.e., a commodity that's non-rival & non-excludable.

- E.g., lighthouses, parks, discoveries, defense, etc.

- Problem is to finance and sustain public goods.

- Solutions to free riding are taxes or philanthropy.

- Works for look-up data: SDSS, Wikipedia, GPS, etc.

Evidence & the "Externality" Problem

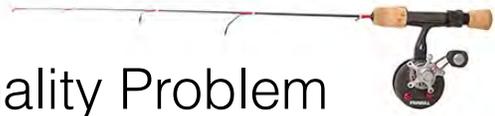
- Data is not a "public good" (excludable).

- Evidence for policy isn't either (actually rival).
  Need models, hypotheses, and causal inference.

- "Externality" or "spillover" is when you affect others
  without their choice, e.g., air or water pollution.

- Every query answered leaks *privacy* and *validity*!

- Solution: regulate bad behavior, facilitate good.

Accuracy & the Externality Problem


- Validity of testing a hypothesis against a null H?
  Reject null if p= prob of data D given H is < .05.

- Say another project tests D against another null H'.
  But should publish only if prob of D given H *or* H'<.05.

- Or try 100 tests. Noise should make 5 look significant.
  If put other 95 away, literature will differ from evidence.
  Called *p-hacking*, *hypothesis fishing*, or *data mining*.

- Solutions: Limit access. Or pre-register hypotheses.
  Or use some data to explore, set-asides for testing.
  Or control validity-leakage rate using DP methods…

Facts about Privacy [from DR14]

- Database Reconstruction Theorem: Too many
  statistics answered too accurately from a confidential
  database will expose the entire database for sure.

- Data cannot be fully anonymized & remain useful.

- Re-identifying anonymized data is not the only risk.

- Queries over large sets are not protective.

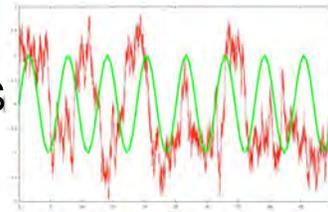
- Query auditing is problematic & provably impractical.

- Neither summary statistics nor ordinary facts are safe.

Privacy Solutions [DMNS 06]

- Idea: allow researchers to ask certain questions about a dataset D to a *mechanism* M that adds noise to the true answer, then gives an approximate answer M(D).

- Definitions: Let $\varepsilon > 0$ and let U be a database I cannot see. It has a row for each individual's information. Call a pair of datasets D and D' *neighbors* if they differ in at most one row. Before learning M(U), I have prior beliefs about the odds that U=D vs. U=D'. We say M satisfies ε-*differential privacy* if learning M(U) cannot change those odds by more than a factor of $exp(\varepsilon)$.

Differential Privacy Properties


- Note: Because $exp(\varepsilon) \sim 1 + \varepsilon$ for small ε, this means M(U) tells you almost nothing new about U=D vs D'.

- DP Theorem: There exist useful M that satisfy ε-DP. E.g., given a standard statistical question about U, compute the answer then add noise of "size" ε.

- Participation: Anything learned from M(U) or after is essentially the same whether or not your info is in U.

- Composition: Doing M1 then M2 is $(\varepsilon 1 + \varepsilon 2)$-DP.

Privacy & the Externality Problem

- Only shows how to regulate the leakage of privacy. Still can't answer too many questions, or researchers could average out the noise. Need a *privacy budget*.

- Small ε means more privacy. But requires more noise. So can ask more questions, but get less accuracy.

- Synthetic Dataset Theorem: Given D, you can run an M that approximately answers certain statistical questions in such a way that researchers can hardly ever tell M(D) from M(D'), even after many queries.

Produce Evidence but Limit Externalities?

- Let data scientists explore away at synthetic data.

- Given a hypothesis so generated, access data to test it using DP to control privacy *and* validity leaks.

- Yes, Differentially Private methods also control overfitting and false positive rates by ignoring D vs D'.

- Thus distinguish between *exploratory* work on data vs. *confirmatory* research that can produce evidence.

- Who will help facilitate all this for researchers?

High Transaction Costs for Researchers

- Gov't can try to reduce such costs: currency, FOIA.

- Administrative data use is now *ad hoc*: Hard to obtain, prepare, protect, supply, sustain, study, link.

- Need trusted intermediaries with sector expertise. Call these *Administrative Data Research Facilities*.

- For gov't *or* proprietary data, e.g., IRIS, Kilts, AISP, CDRC. ADRF's may also help with federal statistics.

- Make a network, call it the ADRN, to share standards and best practices for producing reliable evidence.

🚫Process encrypted data

The circuits can get slow.

13

Crypto Advances: Homomorphisms

• Long word, simple idea

$$\text{Encrypt}(X + Y) = \text{Encrypt}(X) + \text{Encrypt}(Y)$$

$$\text{Decrypt}(\text{Encrypt}(X + Y) = X + Y$$

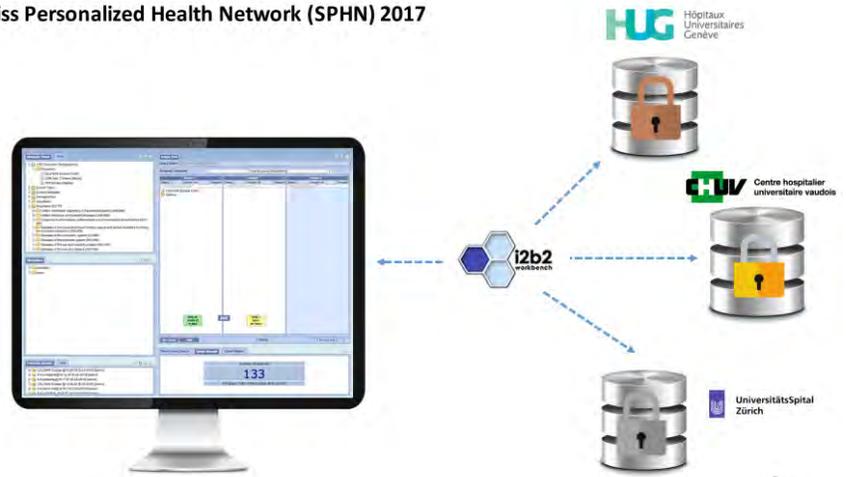
• Can perform arbitrary mathematical computations!
• Major recent advances in academia and industry.

14

Application in Health Data Mining

- EPFL & Sophia Genetics

- Integration of homomorphic crypto into popular health database exploration software (i2b2)

- Issue queries like "how many patients have congestive heart failure and genetic variant x?"


J.L. Raisaro, et al. Privacy-preserving explocation of genetic cohorts with i2b2 at Lausanne University Hospital. 3rd International Workshop on Genome Privacy & Security. 2016.

16

Real Working Software

- Time to compute is quick – seconds (or less)!

- I encourage you to watch Kristen Lauter's talk from the 2016 Genomics and Patient Privacy Conference

https://www.youtube.com/watch?v=vUtyuw7YLVM

The following video is presentation from Kristin Lauter, PhD, Principal Researcher and Research Manager for the Cryptography group at Microsoft Research. She presents a demonstration of privacy preserving technologies for genomic data sharing.

Kristin's group has won the iDASH 2016 competition in Track 3, Testing for Genetic Diseases on Encrypted Genomes (secure outsourcing). This is to calculate the

Where are We?

- The basic math behind secure computation is there.

- The software is there … for special circumstances.

- The software is not there… for arbitrary on the fly computations*

*It is for secret sharing, but not for homomorphic computation

19

What are the Challenges?

- Secure computation is NOT a panacea

- Computation can be secured, but the answers can still leak information
  - Example: Queries that reveal answers with very small counts

- There will always be a need for good key management, authentication, and (to a certain extent) trust – both in the system and the data

20

One More Thing – Secure Hardware

- Multiparty crypto may not be necessary in the future.

- Tamper resistant hardware may provide an opportunity for performing statistical analysis on plaintext.

- Hardware obscures individuals from viewing what's taking place.

- Example: our work on the IBM Secure co-processor in 2012*

*Canim M, Kantarcioglu K, Malin B. Secure management of biomedical data with cryptographic hardware. IEEE Transactions on Information technology in biomedicine. 2012; 16(1): 166-175.

An Integrated System for Confidential Data Access

Jerry Reiter
Department of Statistical Science
Information Initiative at Duke
Duke University
jerry@stat.duke.edu

1

Acknowledgements

2

The vision we are working towards

- Integrated system for access to confidential data including

    - unrestricted access to **fully synthetic data**, coupled with

    - means for approved researchers to access confidential data via **remote access** solutions, glued together by

    - **verification servers** that allow users to assess quality of inferences from the synthetic data.

3

Synergies of integrated system

- Use synthetic data to develop code, explore data, determine right questions to ask
- User saves time and resources when synthetic data good enough for her purpose
- If not, user can apply for special access to data
- This user has not wasted time
    - Exploration with synthetic data results in more efficient use of the real data
    - Explorations done offline free resources (cycles and staff) for final analyses

4

Synthetic data: Where are we now?

- Available data products (released by Census Bureau)
  - Synthetic Longitudinal Business Database,
  - Synthetic Survey of Income and Program Participation
  - OnTheMap
- Off-the-shelf software to generate synthetic data?   Not yet.
- General plug-and-play routines?
  - *Model based synthesis* – yes, but hard to characterize disclosure risks beyond re-identification
  - *Formally private synthesis* – much theoretical development, but not much practical experience for complex datasets

5

Verification servers: Where are we now?

- Allowable verifications depend on user characteristics
- We have developed verification measures that satisfy **differential privacy**
  - Plots of residuals versus predicted values for regression
  - ROC curves in logistic regression
  - Statistical significance of regression coefficients
  - Tests that coefficients exceed user-defined thresholds
- R software package in development
- Open question: how to scale up while respecting privacy budgets

6

Illustrative application: The OPM Synthetic Data Project

- Created fully synthetic version of the OPM CPDF-EHRI status file
  - Longitudinal work histories of civil servants from 1988 to 2011
  - Simulate careers, demographics, grades and steps, salaries, ...
  - Only available to OPM and Duke IRB approved researchers at the moment

7

Illustrative application: Verification of regression

- Regress log salary on demographics, including gender and race
- Hypothetical results from the synthetic data (dummy numbers as we are vetting final analyses):
  - Median salaries for Asian men are about 1.5% lower than median salaries for white men, holding all else constant
  - Huge sample sizes, so statistically significant
- Is the result from the synthetic data believable?

8

Illustrative application: Verification of regression

- User defines a threshold that represents a result of practical significance
  - Test if true coefficient for Asian male $B < -.01$
- Verification software returns differentially private answer that reflects uncertainty due to noise
  - Goal: estimate the probability, $p = \Pr(B < -.01)$
  - Output: 95% credible interval for p
  - Examples:
    - interval for p is (.92, 1.0), conclude synthetic data result valid
    - interval for p is (.52, .64), don't trust synthetic data result

9

Confidentiality protection and physical safeguards

Lars Vilhuber

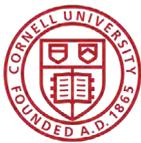
Submitting analysis programs by email or through website (possibly combined with synthetic microdata)

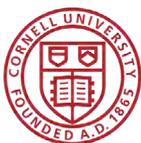
What type of room?

Access matrix for confidential data

	# access points	Control by data provider of:		Avail. analysis methods	Type disclosure avoidance
		Access computers	Access rooms		
FSRDC researcher	24 sites (~700 users)	Full	Full (badge access)	Some (choice of software)	Manual/ variety of rules
Census staff researcher	n.d.	None (VDI)	None (VDI)	Some (choice of software)	Manual/ self/ variety of rules
IAB: JoSuA researcher	414 users	None (Web application)	None (Web application)	Smaller (software, whitelist commands)	Manual/ variety of rules
CASD researcher	371 sites (1471 users)	Extra Full (custom-built hardware)	Some (university office, EU)	Some (choice of software)	Manual/ variety of rules €300/ pack of 10
Stat.Denmark (typical EU)	?	None (VDI) - Some (host institution)	None (VDI) - Some (host institution)	Some (choice of software)	Manual/ self/ variety of rules

How do results leave the room?

Typically, the **researcher** asks an **authorized agent** of the data provider to **review** the results for **risks of disclosure**, and he will then **send them** to the researcher


What if the "authorized agent" were the researcher?


self-controlled release of results

- Researcher controls release of results
  - Prepares results herself
  - According to certain prescribed rules
  - Sends them through a system
  - Automatically receives results typically per email
- Used
  - Most often by contractually-controlled non-enclave data
  - Data in some university- or faculty-controlled enclaves (HRS, Dept. of Ed)
  - Danish researcher access system

access methods: enclaves

Ease of use

Tabulations

Public-use microdata

Self-controlled release

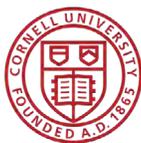
Census staff researcher	n.d.	None (VDI)	None (VDI)	Some (choice of software)	Manual/ self/ variety of rules
IAB: JoSuA researcher	414 users	None (Web application)	None (Web application)	**Smaller** (software, whitelist commands)	Manual/ variety of rules
CASD researcher	371 sites (1471 users)	Extra Full (custom-built hardware)	Some (university office, EU)	Some (choice of software)	Manual/ variety of rules €300/ pack of 10
Stat.Denmark (typical EU)	?	None (VDI) - Some (host institution)	None (VDI) - Some (host institution)	Some (choice of software)	Manual/ self/ variety of rules

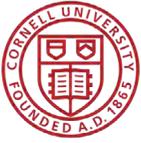
penalties


penalties

- FSRDC and federal employee:
  - federal prison sentence of up to **five (5)** years, a fine of up to **$250,000**, or both.
- France:
  - prison sentence of up to **one (1)** year, a fine of up to **€15,000**, or both.

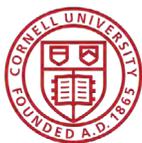
penalties

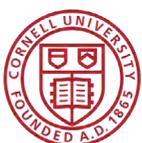
- IAB:
  - Loss of data access for up to **two (2)** years for researcher and institution
  - Contractual penalty up to **€60,000** paid by the **institution**
- Denmark:
  - Researcher: Loss of data access **for life**, or up to **three (3)** years for "minor breaches"
  - **Institution**: Loss of access for a positive but limited (undefined) period
  - No financial or penal penalties

Of Note: the FSRDC contract explicitly excludes a responsibility of the university for the actions of its employees, though university remains bound by FWA/IRB.


penalties

- Does **ease of application** matter (penal vs. contractual rules)?
- Is it conducive to more strongly **engage** the researcher's **employer** (typically but not exclusively a university)?

trust and access


What type of person?


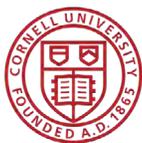
hypothesis: culture matters

- Researchers and agencies create the communities in which rules are applied and enforced
  - Training and "indoctrination":
    - Training of FSRDC researchers (short, decentralized) vs. FedStat employees (≥1 day on-site)
    - 1 full day on-site (in Paris) training for French researchers
  - Common forums:
    - Conferences: Canadian, US (FSRDC, NCHS) yearly RDC conferences
    - Discussion, local groups: users of FSRDC share a common physical space
- More or less tight binding of researchers into a community is important

virtual enclave = centralization

Concerns about centralized compute infrastructure

- Scope
  - FSRDC infrastructure dwarfed by other federal research investments (e.g. XSEDE) that cannot be utilized

Cluster	Cores	Tflops	As a multiple of FSRDC
FSRDC	240	4.36	1x
Wrangler (TACC)	2304	62	14x
Stampede (TACC)	102400	9600	2202x


summary

---

some concluding thoughts

- How to enable a scalable and secure system
  - Does it require changes in the legal framework?
  - How to build a culture of responsible and secure data access among researchers?
  - What kind of devices or access mechanisms do we want to enable?
  - Who gets to hold the data that researchers actually access?

thank you

Legal Standards for De-identification

Alexandra Wood

Berkman Klein Center for Internet & Society at Harvard University

Presentation before the Commission on Evidence-Based Policymaking
February 24, 2017

These opinions are my own. They are not the opinions of the Berkman Klein Center, any of our funders, nor (with the exception of co-authorship on previously published work) my collaborators.

Evolving landscape for government data releases

- Government agencies are making efforts to release more information to the public for a wide range of purposes from transparency and accountability to scientific research and innovation.

- Releasing data about individuals inherently carries privacy risks.

- De-identification has long been used to enable the release of data while addressing privacy concerns.

- However, scientific understanding of privacy is evolving and traditional approaches to de-identification are increasingly shown to be inadequate.

Overview of US legal framework for de-identification

- De-identification standards are highly sector- and context-specific and vary widely depending on the setting. For example, some standards provide an objective for de-identification, while others prescribe a method for de-identification.

- Applicability is typically a binary determination that turns on the interpretation of terminology such as personal information, personally identifiable information, or individually identifiable information.

- Practices also vary, but generally are heuristic and focus on withholding, removing, or coarsening pieces of information considered to be identifying.

Variations in standards: Selected laws

- HIPAA Privacy Rule

- Family Educational Rights and Privacy Act

- Confidential Information Protection and Statistical Efficiency Act

- Massachusetts data security regulation

HIPAA Privacy Rule

Method #1 for de-identifying data: Expert determination

A person with appropriate knowledge of and experience with generally accepted statistical and scientific principles and methods for rendering information not individually identifiable:

(i) Applying such principles and methods, determines that the risk is very small that the information could be used, alone or in combination with other reasonably available information, by an anticipated recipient to identify an individual who is a subject of the information; and

(ii) Documents the methods and results of the analysis that justify such determination

HIPAA Privacy Rule

Method #2 for de-identifying data: Safe harbor

(i) Categories of information from a list of 18 identifiers (e.g., names, geographic units containing 20,000 or fewer people, dates (except year), telephone numbers, Social Security numbers, etc.) are removed, and

(ii) The covered entity does not have actual knowledge that the information could be used alone or in combination with other information to identify an individual who is a subject of the information.

(45 C.F.R. § 164.514)

Family Educational Rights and Privacy Act

Permits the release of de-identified information, without consent, "after the removal of all personally identifiable information provided that the educational agency or institution or other party has made a reasonable determination that a student's identity is not personally identifiable, whether through single or multiple releases, and taking into account other reasonably available information." *(20 C.F.R. § 99.31(b)(1))*

Personally identifiable information includes, but is not limited to, names, addresses, personal identifiers (e.g., SSNs, student numbers, biometric records), indirect identifiers (e.g., date of birth, place of birth, mother's maiden name), other information that, alone or in combination, is linked or linkable to a specific student that would allow a reasonable person in the school community, who does not have personal knowledge of the relevant circumstances, to identify the student with reasonable certainty, or information requested by a person who the educational agency or institution reasonably believes knows the identity of the student [in the requested record]. *(20 C.F.R. § 99.3)*

Confidential Information Protection and Statistical Efficiency Act

CIPSEA protects data in identifiable form, meaning "any representation of information that permits the identity of the respondent to whom the information applies to be reasonably inferred by either direct or indirect means."

Confidential Information Protection and Statistical Efficiency Act of 2002, Pub. L. No. 107-347, tit. V, § 502 (4) (2002).

Massachusetts data security regulation

Personal information is defined as the combination of

(1) *a Massachusetts resident's first name (or first initial) and last name, and*

(2) any one or more of the following:

    (a) Social Security number,

    (b) Driver's license number or state-issued identification card number, or

    (c) Financial account number, or credit or debit card number.

This definition explicitly excludes publicly available information.

(201 Mass. Code Regs.§ 17.00)

Gaps in the current framework

- De-identification standards in the US often rely on concepts such as personally identifiable information that are not precisely defined.

- Guidance on selecting among and applying privacy measures is limited.

- Standards focus on releases of data in microdata (individual-level) formats.

- Standards and guidance encourage use of a narrow subset of the privacy measures available and hinder adoption of stronger techniques.

- Lack of clear guidance leads to inconsistent practices and uncertainty. As a result, similar privacy risks (or even identical data) are sometimes treated differently by different actors.

Limitations of de-identification more generally

- Advances in the scientific understanding of privacy have demonstrated that privacy approaches relying exclusively on de-identification fail to provide reasonable protection.

- While they may reduce some risks, traditional de-identification approaches

  - Do not prevent all disclosures or protect information in the manner that most individual subjects would expect,

  - Address only a subset of privacy attacks and attackers,

  - Are not readily scalable for use by non-experts, and

  - Often result in the redaction or withholding of useful information.

A modern approach

- In light of the limitations of de-identification, practitioners may consider:

  - Conducting a systematic analysis of informational risks and intended uses, and

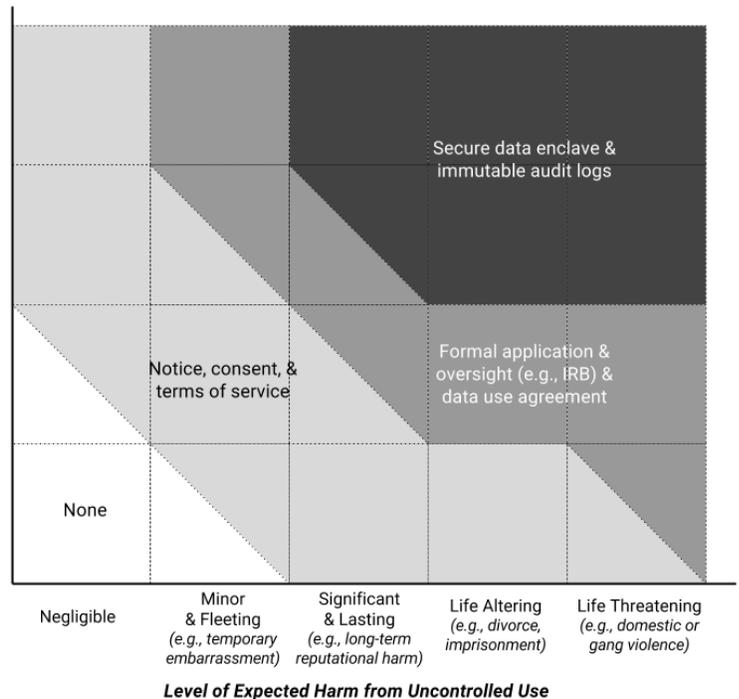
  - Implementing a combination of privacy and security controls rather than relying solely on de-identification.

- For example, a **tiered access model** can

  - Closely match combinations of privacy controls to different risks and intended uses at each stage of the information lifecycle, and

  - Bring gains in both privacy and utility for a broad range of uses across different types of data.

A modern approach

Selecting combinations of appropriate privacy and security controls based on informational risks


A modern approach: Example tiered access model

Federal-State Partnerships in Support of Data-Informed, Evidence-Based Programs

Maria Cancian

Commission on Evidence-Based Policymaking
March 13, 2017

Research | *Training* | *Policy* | *Practice*

1

Context

- **Uncoordinated programs and services are wasteful and often less effective**
- **Sharing information is necessary for coordination and responsible management of taxpayer resources**
- **We need a "Yes, Unless" expectation of data sharing:**
  - Technology and systems with capacity to safely and efficiently share data
  - Rules and policies that support responsible data sharing
  - Empowered governance structures to manage data sharing
  - Agency culture that recognizes the risks of failing to share

INSTITUTE *for*
RESEARCH *on*
POVERTY
UNIVERSITY OF WISCONSIN–MADISON

2

Opportunities for Federal Leadership

- **Clarify permissible practice and expectations**
  - Articulate a "Yes, Unless" culture
  - Remove regulatory barriers, actively support and promote appropriate data sharing as a fundamental responsibility
  - Hold federal agencies and states responsible when failure to share data imposes costs on participants and systems
- **Provide Resources**
  - Guidance and TA on sharing data across program silos
  - Model systems, infrastructure, and tools
  - Support for federal agency efforts (technology, governance, data management), and state integrated data systems

INSTITUTE *for* **RESEARCH** *on* **POVERTY**
UNIVERSITY OF WISCONSIN–MADISON

3

Recent Examples from ACF (1)

- **Information Memorandum on "Data sharing between TANF and child welfare agencies"**
  - Clarifying *existing* permissions
  - Articulating the logic and benefits of data sharing
- **Comprehensive Child Welfare Information Systems Regulation (CCWIS)** makes data sharing a fundamental component, requiring:
  - New data exchanges with education, courts, and Medicaid
  - A data exchange standard for interfaces with service providers and other agency systems

INSTITUTE *for* **RESEARCH** *on* **POVERTY**
UNIVERSITY OF WISCONSIN–MADISON

4

Recent Examples from ACF (2)

- **New Division of Data and Improvement within the ACF Office of Planning, Research, and Evaluation (OPRE)**
  - Integrate existing previously disconnected efforts:
    - State system assessment
    - PARIS data matching
    - Support for interoperability and data exchange (e.g. NIEM)
  - Support data sharing across ACF programs (e.g. TANF, child welfare, child support), with other agencies and programs in HHS (e.g. Medicaid) and beyond (e.g. SNAP) with technical and legal resources
  - Support data-informed decision making through improved data systems combined with analytic capacity, planning, and evaluation resources within OPRE

INSTITUTE for RESEARCH on POVERTY
UNIVERSITY OF WISCONSIN–MADISON

5

Recent Examples from ACF (3)

- *Proposed* **State Human Services Longitudinal Data System**
  - Aligns federal and state interests; States as willing partners, with federal government offering TA, peer learning, funding
  - Supports program management and delivers directly to program administrators – improving buy-in and data quality
  - Addresses challenge of harmonization across programs in different organizations, with capacity to roll up to national level
  - Could include incentives and capacity to share data with federal system for administrative use, research/statistical use, or both
- *Proposed* **Systems Innovation Technical Assistance Center**
  - Supports shared software and standards/architecture development
  - Current program funding "vertical" with limited support for integration
  - Current funding state-specific, not leveraging reuse

INSTITUTE for RESEARCH on POVERTY
UNIVERSITY OF WISCONSIN–MADISON

6

Key Objectives of Data Sharing

- **Improving Services, e.g.:**
  - Streamline eligibility determination by sharing verified information across programs to reduce administrative costs and burden on participants
  - Connect information from schools or health providers to child welfare records to improve continuity of educational and health services, avoid waste

- **Measuring Performance**
  - Individual program performance and variation over time or across jurisdictions
  - Indicators of performance drawn from other systems serving the same participant (e.g. the earnings of job training program participants, the educational outcomes of children in foster care)

- **Supporting Formal Evaluations and Research**
  - Reduce the costs and respondent burden associated with surveys
  - Capture detailed and accurate information on government services

Ingredients for Organizational Change (and How the Commission Can Help)

- ➢ Leadership
- ➢ Opportunity
- ➢ Definition of Success
- ➢ Metrics/Visibility Systems
- ➢ Accountability Systems
- ➢ Predictable and Repeatable Processes
- ➢ Mission-Focus Among Staff/Incentive Structures

Expanding the Statistical System's Capacity to Support Evidence-Building

Recommendations to the Commission on Evidence-Based Policymaking
from the Interagency Council on Statistical Policy (ICSP)

Brian C. Moyer

March 13, 2017

The Role of ICSP

- Advises and assists OMB in the coordination of Federal statistical activities
- Fosters interagency coordination and collaboration
- Membership: 13 statistical agency heads + 1 rotating member, led by the Chief Statistician of the United States
- Authorized by 44 U.S.C. § 3504

2

The U.S. Federal Statistical System

- The U.S. decentralized system includes about 120 agencies
- A substantial portion of official statistics are produced by 13 principal statistical agencies

3

View Around the President's Cabinet Table

Agriculture	Commerce	Defense	Education	Energy

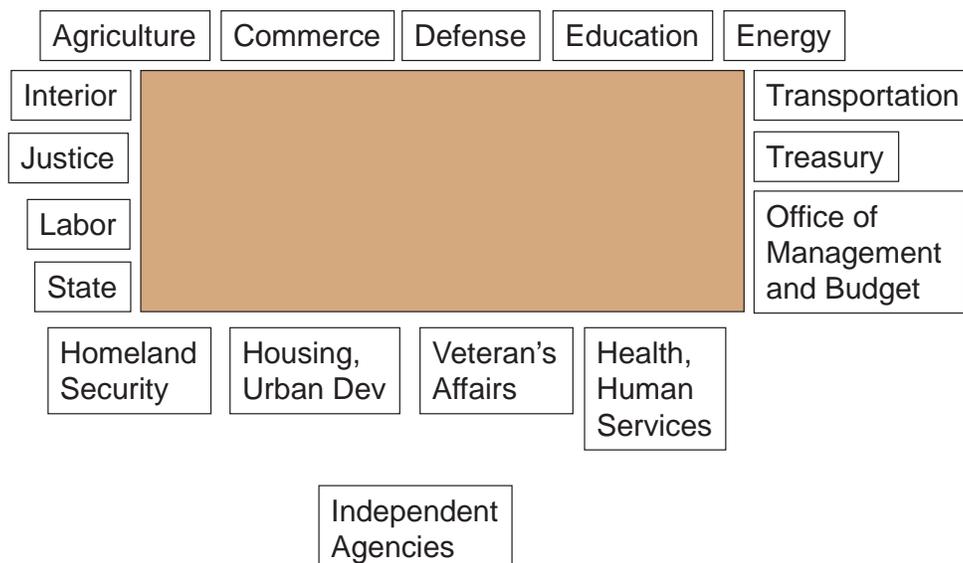
Interior		Transportation
Justice		Treasury
Labor		Office of Management and Budget
State		

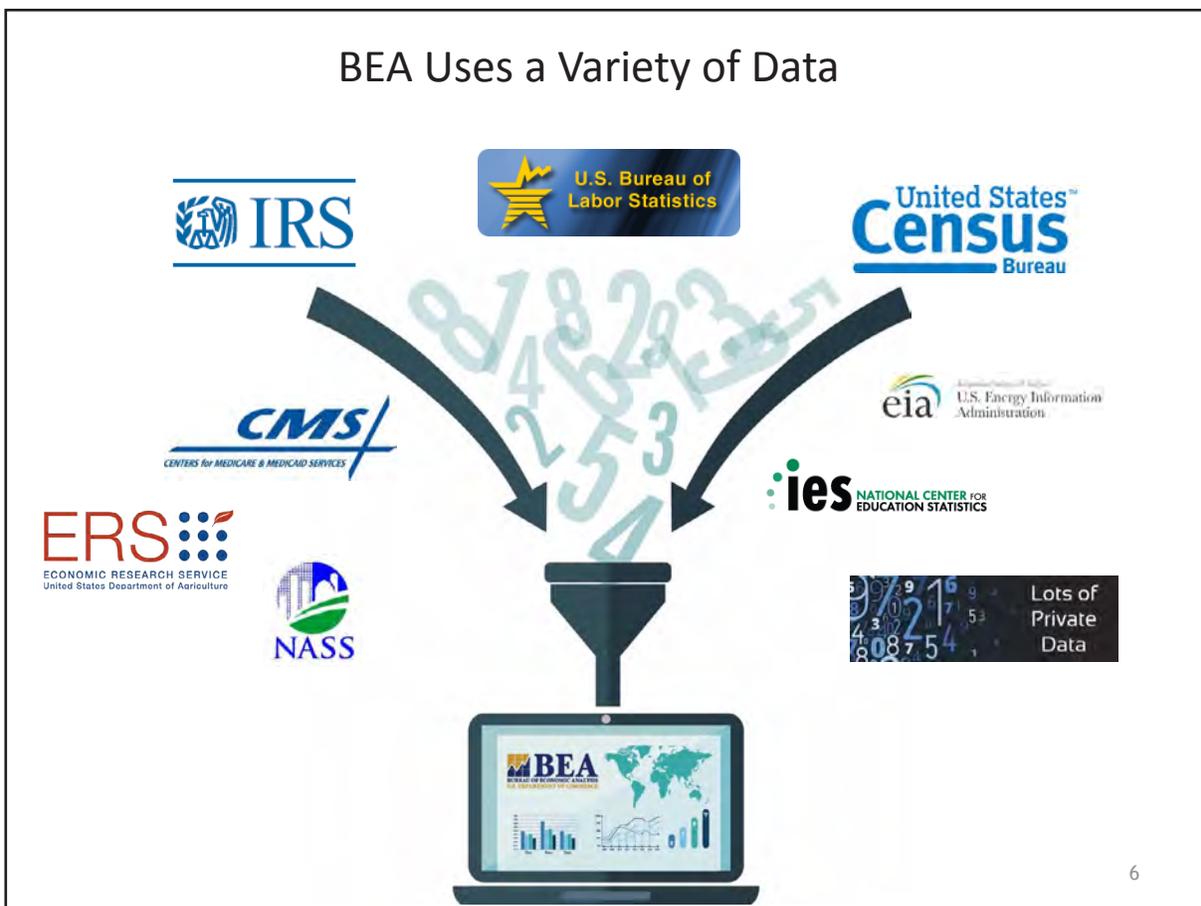
Homeland Security	Housing, Urban Dev	Veteran's Affairs	Health, Human Services

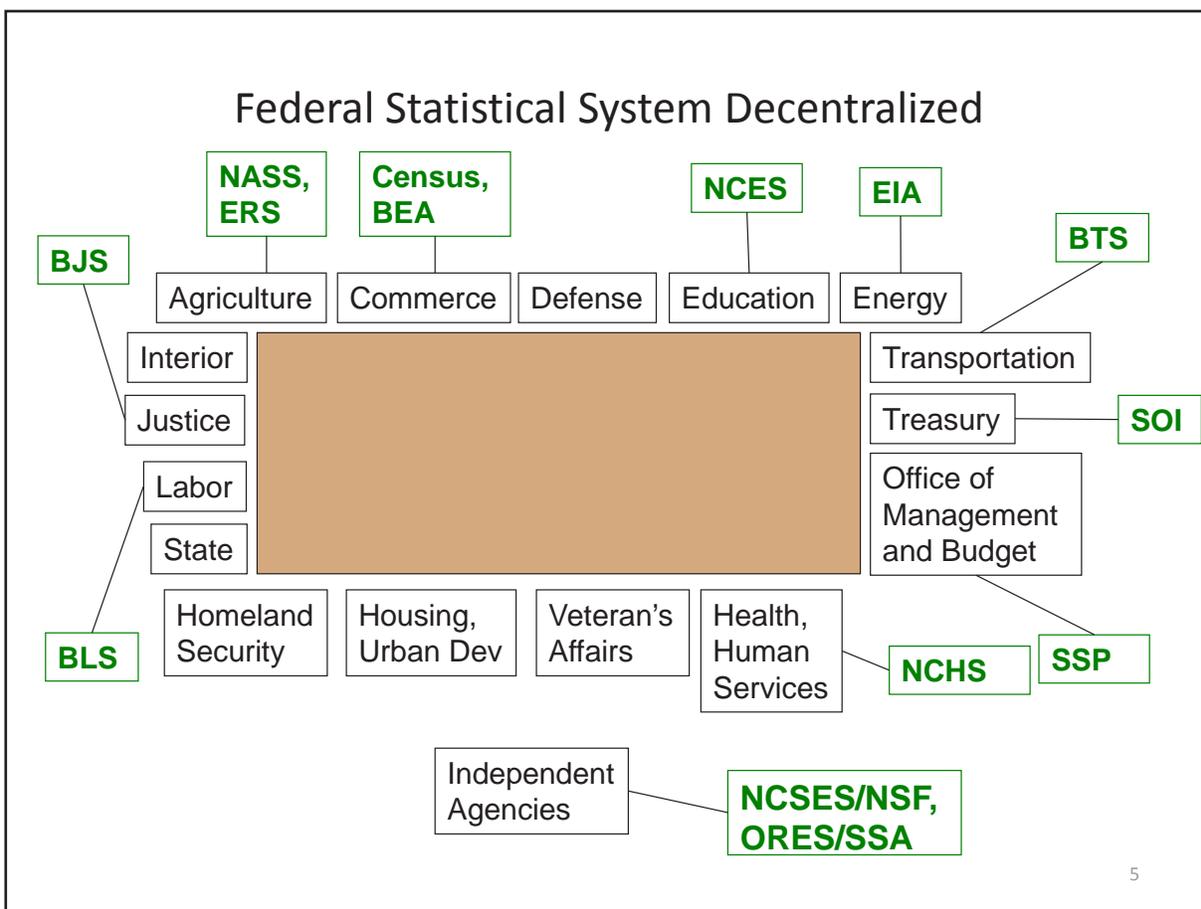
Independent Agencies

4

Federal Statistical System Decentralized

BEA Uses a Variety of Data






Recommendations

- Establish a research environment that brings together data sets from across the statistical agencies

- Streamline the research approval process to expedite evidence-building work

- Modify legislation to expand the allowed use of administrative data for statistical purposes

- Implement strategies that increase access to and improve the quality of State and Local government data

7

Establish a new research environment

- Build a research and computing environment that more fully supports the use of statistical information for a range of activities, including evidence-based policy research

  - Available to governmental and non-governmental researchers

  - Provides convenient data access for users who are not located geographically close to statistical agency operations

  - Equipped with systems designed to enhance privacy and protect data confidentiality

8

Streamline the research approval process

- Current approval process is cumbersome

- Recommend modifications to existing process, not elimination

    - Establish review boards composed of technical representatives from the agencies that own the data to be used in the proposed project

    - Harmonized, transparent processes for requesting and accepting research project proposals

- ICSP can oversee and coordinate these modifications

9

Modify legislation to expand allowed use of data

- Regulations that are in place to protect data confidentiality and privacy sometimes prevent statistical use of data

    - Example 1: Use of federal tax data by non-Treasury employees is limited to "tax administration" purposes

    - Example 2: Census Bureau has broad access to federal tax data, BEA has limited access, and BLS has no access

- Recommend broadening/amending language in the Internal Revenue Code to address above examples

10

Increase access to and quality of State and Local data

- Many valuable types of administrative data are collected by State and Local governments but made available only in a limited manner to Federal agencies

- Process for Federal agencies to acquire the data can be very time-consuming and costly (e.g. BLS QCEW agreements)

- ICSP can oversee a review of existing State and Local data collections to assess current needs and avoid duplication of requests made by Federal agencies

  - Use results to formulate consolidated requests by Federal agencies, identify pilot projects to improve data quality

11

From Strategy to Action:
Improving Program Outcomes through
Targeted Data-Sharing Across Programs

Commission on Evidence-Based Policymaking
March 13, 2017

Presented by:

Erin Ulric, MPH, Nutrition Services Branch Chief (WIC, CACFP, Early Childhood Obesity Prevention)

Colorado Department of Public Health and Environment

In Today's Discussion:

- Describe Colorado WIC, the services it provides and the data it collects

- Present Colorado WIC's strategic planning efforts including a focus on measuring progress towards goals

- Describe the current data sharing efforts in WIC and across the state (specifically with the Census Bureau)

- Share barriers to expanding data sharing across efforts for Colorado and other Mountain Plains Region WIC States

What is WIC?

WIC is The Special Supplemental Nutrition Program for Women, Infants and Children.

WIC's goal is to help keep low-income pregnant and breastfeeding women, infants and children younger than age 5 healthy. To do this, WIC provides:

• Personalized nutrition consultation

• Breastfeeding information, support and referrals

• Free, healthy food

• Referrals for medical and dental care, health insurance, child care, housing, lactation support, and other services that can benefit the whole family

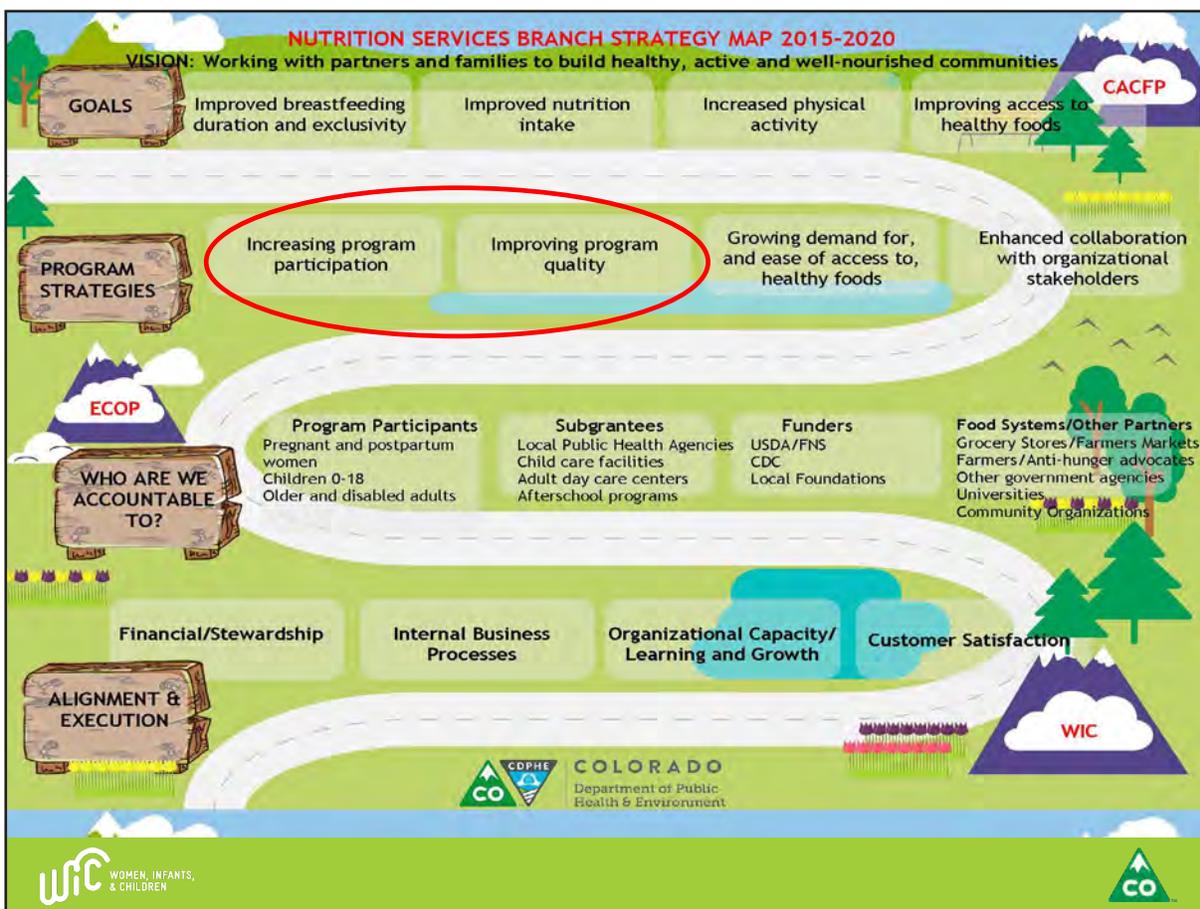
WIC WOMEN, INFANTS, & CHILDREN   CO

What data do we collect?

Basic demographic information

Quantitative and Qualitative Nutrition Measures

Information about all services provided during the appointment

WIC WOMEN, INFANTS, & CHILDREN   CO


Colorado WIC and the Census Bureau

- Agreement between US Census and USDA was signed in August of 2014.

- The agreement between Colorado WIC was formalized in March of 2015 and the final data compilations were provided to Colorado WIC in May of 2016.

- Data provided showed potentially eligible populations from calendar years 2013 and 2014

Use of Census Bureau Data

- Track program performance and identify populations for targeted outreach

- Colorado Gap Map

1	52.9	(2.2)	62.2	(2.8)
2	53.7	(1.8)	57.2	(2.8)
3	53.8	(2.0)	47.7	(2.7)
4	52.5	(1.8)	41.3	(3.3)

Barriers to Data Sharing

- Complexity of data and a lack of resources to understand and extract the data

- State leadership buy-in and encouragement of data-based decision making

- Different legal interpretations of data-sharing by state/agency/program

- Collaboration between programs to understand what data is available and how it can be used

Future support for data-sharing

Increased technical assistance and legal guidance around acceptable data-sharing from the Federal level to the States

Targeted funding for research, data collection and analysis

Involve third party entities (i.e. National WIC Association, American Public Health Association) in disseminating best practices to their respective members to increase buy-in

This page intentionally left blank

Appendix G: CEP Public Input–Hearing Testimony and Other Public Comments

The Commission provided numerous opportunities for any member of the public to provide input to the Commission's fact-finding. The Commission convened three open public hearings—in Washington, DC, Chicago, and San Francisco—during which any member of the public who requested to testify before the Commission was allowed to present. A total of 39 members of the public presented information during the three hearings.

The Commission also issued a Request for Comments in the Federal Register and accepted comments by email, which generated over 350 responses from the public.

Appendix G includes written testimonies, a copy of comments submitted to the Request for Comments, and other public comments provided to Commissioners and staff.

Washington, DC Public Input–Hearing Testimony

H1_2016_06
October 21, 216 Hearing
Young Invincibles
Presenter: Tom Allison

Abstract

Policymakers are making decisions about higher education without crucial performance measurements. The Commission on Evidence-Based Policymaking represents a unique opportunity to address this problem, and collect and use the information students prioritize the most: how different colleges serve today's diverse student bodies, which majors and programs lead to specific occupations and industries, and whether students are repaying their student loans.

Statement

Thank you for the opportunity to speak before you today. My name is Tom Allison and I am the Deputy Director of Policy and Research for the Young Invincibles, a national research and advocacy organization working to expand the economic opportunities for young adults.

We know a lot about college and universities: how much schools charge for tuition and fees, how many students they enroll, and what types of programs or majors they offer.

We also know a lot about jobs and workforce trends: how many people are unemployed, how much money different types of workers make, which industries are growing and shrinking, and what skills employers are looking for in their workers.

The problem arises however, when attempting to draw connections between what we know about colleges and universities, and what we know about jobs and the workforce. Preventing us from connecting that link, is the Student Unit Record Ban, a single paragraph in the 2008 reauthorization of the Higher Education Opportunity Act, prohibiting the Department of Education from collecting and using student-level data. This is frustrating for today's students, who carry challenges and aspirations unique from previous generations, and the majority of which pursue higher education to improve their economic opportunities. Choosing where to go to school, what to study, and how to pay for it comes with the highest stakes of any decision in their life. Students and families need and deserve better insight to inform these decisions.

Moreover, without outcomes information on which schools and programs lead to jobs and ultimately financial security for their graduates, policymakers are left in the dark, unable to intelligently align funding with policy priorities. Colleges are also blind to students' trajectories after they leave campus and cannot adjust academic programs or systems to ensure students can land good jobs or pursue further education.

Over the course of two years, Young Invincibles conducted workshops, listening sessions, and roundtable discussions with current and aspiring college students across the country to better understand their priorities and values in attending and paying for college. We synthesized their voices in the Student Agenda for Data Reform and organizations representing over one million students currently support it. We will submit it in our written comments to the Commission, but in brief the agenda calls for overturning the student unit record ban, collecting more information about innovative platforms and alternatives to traditional higher education, and to protect the privacy and security of sensitive student information.

DC ■ CA ■ IL ■ NY ■ TX

younginvincibles.org

Facebook: /together.invincible | Twitter: @younginvincible

I'd like to dedicate the remainder of my time to read comments from a former student leader and recent graduate from the University of Nebraska, named Thien, whose story illustrates the need to improve our postsecondary infrastructure:

> As a 17-year-old, I did not have nearly enough knowledge of federal loan programs, extra college fees, trends in increasing tuition costs, or credit transferability to make the best possible decision when considering the investment I was making in paying for school. Some online tools can be helpful in estimating front-end costs, but they do little to educate on what life after graduation, or dropping out, would bring. It only takes a few clicks for a student to receive thousands of dollars in loans, but some can end up repaying them for decades afterward. Colleges need to be more transparent when advertising their costs by also informing prospective students on the costs that go along with repayment.
>
> We need more information on which schools best serve first generation and minority students like myself to feel comfortable and assured we'll find a college committed to our success. A college campus can be a very unfamiliar environment when you don't have family members to help navigate the strange new setting. Our institutions of higher education need to paint a more accurate picture of their minority communities, and the rate of success of those communities experience after graduation, including how prepared they are for the workforce. It's a great resource for some of us, who are not used to asking for help and may let ourselves fail out of college before mentioning anything to anyone, but it's frankly not enough.
>
> I can't speak for every low-income, first generation, minority college student in America, but I know these words resonate with a lot of my peers. While we know we need to take the reins of our own success, we need to be empowered to do so, and it is clear that there is a lot of information that needs to be made available before students can make a decision that will impact the rest of their lives and those close to them. What we need right now is better data, more of it, and to have it in a transparent and easily digestible form.

You can read the rest of Thien's story and others on our website. Thank you for your time.

H1_2016_10
October 21, 2016 Hearing
Pew-Macarthur Results First Initiative
Presenter: Sara Dube

October 14, 2016

Dear Members of the Commission on Evidence-Based Policymaking:

The Pew Charitable Trusts promotes transparency and accountability in government through the use of rational, reliable decision-making based on facts and evidence. We bring forth research that shows which policies, practices, and programs are effective. We have used this evidence-based approach to support successful home visiting programs for new mothers, evaluations of state-based tax incentives, and public safety programs to reduce recidivism. Our experience shows that helping policymakers enact evidence-based policies—those that improve states' fiscal health and enjoy broad bipartisan appeal— shifts policymakers' thinking about how to invest taxpayer dollars. As lawmakers see the benefits of evidence-based policymaking in one key policy area, they are more inclined to explore reforms in others.

One of our most successful evidence-based initiatives is the Pew-MacArthur Results First project, a joint effort of The Pew Charitable Trusts and the John D. and Catherine T. MacArthur Foundation. A growing number of states and counties are partnering with the project to make evidence-informed decisions in eight policy areas. At present, we work with 22 states and seven counties to incorporate rigorous research into their policy and budget processes and use evidence to identify and invest in programs that achieve successful outcomes and positive returns on investment.

We applaud the federal Evidence-Based Policymaking Commission's work and share your commitment to bring data and evidence to the forefront of federal decision making. We stand ready to be a resource as you consider how federal policies and practices could support state efforts to use data and research in the policymaking process—and offer our experiences at the state and county level that can inform federal level policies and practices.

The Results First approach includes:
- Creating an inventory of currently funded programs;
- Assessing which programs are most likely to work, based on the best available research;
- Utilizing the customized Results First cost-benefit model to compare programs based on their expected return on investment; and
- Using the results to inform budget and policy choices.

New Mexico has used the Results First approach to compare the expected outcomes of adult criminal justice, child welfare, early education, and behavioral health programs. Using their Results First analysis, state leaders directed more than $100 million to evidence-based programs. In addition, the state is building a culture of evidence by incorporating evidence into their policymaking processes. For example, the Corrections Department adopted a policy that mandates that 70 percent of funds are directed to evidence-based programs. The department also adopted contracting standards that require vendors to document their use of evidence-based practices and monitor outcomes for programs that are developed in New Mexico to ensure that they meet the state's goals.

Mississippi passed legislation in 2014 establishing evidence standards for evaluating the state's corrections, health, education, and transportation programs. Using the Results First model, the state determined that a shock incarceration program—a paramilitary, boot-camp intervention—currently required by statute has been proven ineffective by national research. The legislature subsequently moved to eliminate the program in 2017, and is now developing an evidence-based alternative. In addition, the state, through its budget instructions, now requires executive agencies to justify funding for any new program by identifying evidence supporting the program's effectiveness. Mississippi policymakers expect to use this information to bolster the state's reinvigorated performance-based budget system.

New York State has used the Results First framework to target more than $50 million in state general funds over three years toward effective evidence-based alternatives to incarceration programs. Recipients of these funds are required to show that the programs are being implemented according to their original design—demonstrating fidelity—and that they are achieving expected outcomes. The state also leveraged its Results First analysis to compete for and win a $12 million "Pay for Success" grant from the U.S. Department of Labor.

Iowa's Results First analysis confirmed that the state's existing community-based domestic violence treatment program was not effective in reducing recidivism among domestic abusers. In fact, the model showed that the state was losing $3 for every $1 invested in the program. To improve outcomes for both victims and taxpayers, the department partnered with the University of Iowa to pilot an alternative program known as Achieving Change Through Value-Based Behavior, or ACTV. Preliminary results of the pilot demonstrated positive effects in reducing recidivism and the department subsequently began shifting funds away from the ineffective program and toward ACTV.

Colorado has completed program inventories and cost-benefit analyses in the adult criminal justice, juvenile justice, and child welfare policy areas, and is using their results to re-allocate funds in the FY 16-17 state budget. For example, the state will repurpose $1.9 million in FY 2016- 17 and $2.4 million in subsequent years for a new community corrections pilot project for at-risk offenders, centering the offender's treatment on cognitive behavioral therapy (an evidence-based program). The state has also dedicated $7.2 million (in FY 2016-17, with investments of $9.5 million each year after) to Communities That Care, a prevention system designed to reduce levels of adolescent delinquency and substance use through the selection and use of effective evidence-based preventive interventions tailored to a community's specific profile of risk and protection.

These are just a few of many examples of states using evidence to inform their budget and policy choices. We will submit additional examples and information in response to your request for comments via the Federal Register.

As you develop your recommendations, please consider the effect of federal policies on these state and local efforts, and feel free to contact us and our partners with any questions about the lessons learned at the state level and how they could be applied at the federal level.

Thank you,

Sara Dube
Director, Pew-MacArthur Results First Initiative
The Pew Charitable Trusts

H1_2016_02
October 21, 2016 Hearing
National Prevention Science Coalition to Improve Lives:
Diane Fishbein

> An Automated Evidence-Based-Policy Clearinghouse for Researchers, Practitioners, Federal
> Agencies, and Policymakers: A Proposal to the New Evidence-Based Policymaking Commission

We are aware of your new Evidence-based Policymaking Commission, recently created by Congress and signed into law by President Obama. The bipartisan members who conceived of the need for this Commission are to be congratulated—a recognition of the need to infuse scientific evidence into the decisions of policy-makers is the first step to effectively designing policies that improve our lives while not wasting tax-payer money on unproven strategies.

Our understanding is that Commissioners have been charged with three general tasks: (1) to improve the federal data infrastructure while respecting privacy and security concerns; (2) to incorporate outcomes measurement, cost-benefit data, evaluation, randomized controlled trials (RCTs), and rigorous impact analysis into federal program design; and (3) to consider the value and nature of a clearinghouse that would facilitate access to data by various constituencies and enable the research community to judge what works and what does not.

The Commission will focus on ways to incentivize the rigorous evaluation of programs and policies that aim to reduce the problems associated with detrimental prevailing conditions and promote more healthful and productive outcomes. Until now, many programs we invest in do not possess stringent indicators of their effectiveness and, thus, there is no justification for their continuation.

There is a wealth of data already collected by the federal government and other agencies and organizations reflective of a broad range of phenomena, from physical health to juvenile and criminal justice to climate change. Existing data reserves are currently not well organized and thus an infrastructure is needed to increase the utilization of these data.

To facilitate the process of organizing and fully utilizing the data, we recommend a means to directly and expeditiously improve policy decisions. Our proposal is highly compatible with the law by incorporating federal agency and other data, as well as methodological components that will be readily accessible and understandable to those who stand to benefit. And we believe there will be widespread support from Congress, the White House and a number of organizations which have an interest in evidence-based policy-making.

We propose that the federal government (and expert contractors) develop an automated clearinghouse—perhaps called the "National Evidence-Based Toolkit for Intuitive Navigation" (NETIN)—that will provide comprehensive information regarding evidence-based programs and policies (EBPs) to users; e.g., researchers (who can populate the database), policy-makers (who need to know what to legislate and fund), and community organizations, practitioners and government agencies (that need to identify best practices). The data populating this toolkit will provide parameters needed to readily map available EBPs to existing needs, whether that be to identify best violence prevention practices for any given community or to determine which policies to fund to reduce poverty. Also needed is flexibility to include innovative and/or promising programs that have yet to be subjected to rigorous evaluation but are in the database denoted by their stage of development and need for further study (as per the #2 mandate above).

Parameters will be intuitively searchable and fields will be delineated by relevant characteristics; e.g., outcome of interest (e.g., diabetes, violence, contaminated water); setting (e.g., school, family, community, national); target population (e.g., special needs children, parents, community stakeholders, minorities); implementation protocols and frameworks (costs, timeline expectations to achieve impact, strategies to shift resources from existing to promising or evidence-supported approaches); pertinent literature and resources on assessing and utilizing research; cost-benefit analyses; and other information deemed helpful. The goal is to provide a comprehensive, one-stop resource that is more user-friendly and searchable on dimensions that are not currently available, providing an efficient and valid method to guide evidence-based policy-makers and others who might benefit from the resource.

The system would be both iterative and interactive; e.g., a search for a category of programs may elicit a notation about the need for extra diligence or a particular protocol for implementation. Or reference materials may be recommended if using certain interventions. At all stages of navigation, weblinks would lead to relevant information.

Finally, the Clearinghouse would provide a searchable methodology section for researchers who want to fill in gaps in the Clearinghouse database. There would be guidance on design, methods, statistical techniques, evaluation protocols, and strategies for translation.

We realize this will be a very large and complex undertaking that will take years to complete and will require continual updating. There will also be a need to establish criteria and thresholds for designating programs and policies as evidence-based, not only relative to the statistical findings from RCTs, but the population significance of those results (e.g., how broadly are effects achieved?). Fortunately, there are a number of existing registries that evaluate programs; they can be utilized and integrated as best seen fit. The Commission and their advisors will also want to make decisions about what policy areas to cover (from human behavior and health to security, the economy, and the environment). These objectives for a clearinghouse can be accomplished with sufficient funding and commitment, as well as by calling upon the expertise of evidence-based policy-making organizations, academics, researchers, current registry experts, federal government database keepers, implementation scientists, methodologists, computer scientists, and statisticians. And critical to this effort, to ensure its usability and utility, input must be sought from all potential users (e.g., community groups, policy-makers, agencies, foundations) working in concert with experts.

This proposal is reflective of what policy-makers, practitioners, stakeholders and others need to make informed, adequately justified, and effective decisions when identifying programs and policies that will serve communities and the nation. We have outlined a general roadmap for the creation of a clearinghouse—the Commission's 3rd consideration—with details to be fleshed out after thorough discussion and consultation. Our hope is that the Commission will include such a plan that will bring to fruition their charge to design a data infrastructure and incorporate results from existing and newly conducted studies. There is potential to greatly improve the operations of government, the services provided to citizens, and their financial impact.

October 21, 2016 Hearing
New America
Presenter: Rachel Fishman

Rachel Fishman, Senior Policy Analyst at New America
Submission for the First Public Hearing of the Commission on Evidence-Based Policymaking (CEP)

Abstract: The US Department of Education puts out $130 Billion a year on federal financial aid to help students go to college, and billions more are spent by other federal agencies on higher education through tax credits, the GI Bill, and more. Despite having a tremendous amount of administrative data, policymakers, students, and families know shockingly little about how particular schools and programs are serving students due to a law banning the connecting of these data sets. In an era when college has never been more important nor more necessary, we believe this issue is one the Commission should address directly.

Oral and Written statement: Thank you for the opportunity to speak today about the better use of existing higher education data to support improved decision making by families and policymakers. My name is Rachel Fishman and I am a Senior Policy Analyst at New America in the Education Policy Program which uses original research and policy analysis to help solve the nation's critical education problems.

It's hard to open a newspaper or turn on the television these days without finding another report of the questionable value of college degrees. As anxiety over student debt and college costs reaches new heights, the public is growing increasingly uncertain about the value of a college education. The answer to the question "Is college worth it" is an unequivocal "yes." *On average*. But the real question is: In which program, at which college, at which price and for which students is it worth it?

Students, families, and taxpayers are spending unprecedented amounts on higher education, but remain largely in the dark about *how* to spend these precious dollars. And while colleges and universities spend hundreds of thousands of hours collecting and reporting data, they don't know how their students are faring compared with similar students at similar schools. Institutions of all types are subsidized with hundreds of billions of dollars a year in federal financial aid (not to mention billions more in tax credits, GI Benefits, Department of Labor funds, and more), but taxpayers don't know if these dollars are being wasted at diploma mills or poor-performing institutions. Policymakers have no sense of whether their reforms and investments are helping or hurting the families that most need the boost higher education can provide. At a time when higher education has never been as important or as expensive, it's unimaginable that we can't answer these critical questions.

Why can't we answer them? Because the federal government either doesn't have—or can't use—the right data. That's true, not because it is technically impossible, but because it is illegal. In 2008, Congress passed a law that banned the creation of a federal student unit record system to enable *existing* data systems to speak with one another and answer critical questions.

2

The current hodgepodge of data systems cannot answer basic question like:

- How do part-time and older learners fair in the current system?
- What happens to students who transfer from particular colleges?
- How many—and which—students complete at particular colleges?
- Do students who get some of the more than $30 Billion spent annually on Pell Grants graduate?
- Are graduates able to find jobs that allow them to pay down their debts?

A system that uses already-collected administrative data would allow us to answer these questions.

Creating a Student Unit Record would not require the collection of additional student data, but would allow the connecting of existing data already held by a variety of federal and state agencies. Protecting these data at all points of the lifecycle is crucial, and it is worth considering housing such a system in the Department of Education's National Center for Education Statistics, which is classified as a statistical agency and therefore subject to stringent privacy and security requirements under the Privacy Act of 1974, the Education Sciences Reform Act of 2002 (ESRA), and the E-Government Act of 2002. We can also look to state level systems for best practices that could be implemented at the federal level.

We believe using existing administrative data to better understand the outcomes of students at our nation's colleges is exactly the type of critical policy issue the Commission was designed to address. We know we have just scratched the surface here today and we will provide much more detail about the existing administrative data sources as well as privacy and policy considerations in separate written comments. Thank you for your time and attention and I look forward to answering any questions.

American Evaluation Statement
for the
Commission on Evidence-Based Policymaking

Thank you for the opportunity to discuss the important topic of evaluation of federal programs. I am a professional independent evaluator, formerly Director of Evaluation at the Office of Inspector General, Department of Health and Human Services and the Federal Housing Finance Agency. I am writing as Chair of the Evaluation Policy Task Force of the American Evaluation Association (AEA), the professional organization devoted to the application and exploration of evaluation in all its forms since 1986.

AEA has approximately 7,000 members across all 50 states, as well as 80 other countries. Members have gathered together from many interdisciplinary fields (such as public policy and administration, political science, economics, statistics, psychology, sociology, education, public health, demography, ethnology, etc.) to create a community of learning and practice over the past three decades. Members in academe have worked to develop, refine, and teach evaluation methods, while members in practice have served the evaluation needs of many organizations including agencies across the federal government. Members serve in many federal evaluation, policy, and inspector general offices, and at the Office of Management and Budget.

AEA has developed professional standards for the quality of studies and ethics for the multidisciplinary members of the field. Of particular interest today is AEA's paper: *An Evaluation Roadmap for a More Effective Government.* This document describes many types of evaluation that can address management requirements, as well as principles and practices for ensuring evaluation quality and usefulness, including methods, human resources, budgets, independence, transparency, and professional ethics in a government setting. For your convenience, I have attached a copy for your reference.

I focus here on three main topics: 1) the importance of evidence and the availability of data for government decision makers; 2) evaluation methods; and 3) evaluation in government settings.

Evidence and Data for Decision Makers

Government decision makers, including both the Congress and Executive Branch agencies, need appropriate evidence to make informed decisions to assess and improve the relevance, efficiency, and effectiveness of government programs, policies, and activities (hereafter "programs"). AEA applauds the work of the Commission to help Congress embed evaluation into program design and to ensure that quality data are available for evaluation.

Federal program design should include an appropriate evaluation framework to guide data collection and use over the life of a program. This includes data needed for rigorous impact evaluations as appropriate. Measures of a program's key processes and outcomes should be established while the program is being conceived and developed. In fact, taking time during the process of conceptualizing a new program to specifically define expected outcomes is most useful in establishing relevant metrics. Preliminary metrics should be put into place by the time program implementation begins, thus allowing key data to be collected to monitor program

implementation, determine progress, and set the stage for methodologically rigorous studies. It is vital for some study methods that data be collected prior to the program intervention.

We support the Commission in its efforts to consider *whether and how a clearinghouse for program and survey data should be established*. We encourage efforts to ensure that verifiable, reliable, and timely data are available to permit the objective evaluation of programs, including an assessment of assumptions and limitations in such evaluations. Agencies should use evolving best practices for data security, and ensure that publicly available data are aggregated or otherwise stripped of all information that could be used to identify particular individuals or businesses.

The proposed clearinghouse could also serve as a repository for the evidence contained in evaluation reports, providing an archive capacity for the collection, dissemination, and preservation of knowledge and lessons learned from evaluation studies. This would provide an enhanced base for guiding future program design and management, which often requires a critical mass of knowledge to properly comprehend and address the complexity of program processes and influences. It would also be a great benefit for future meta-analyses of evaluation findings.

While recognizing the high value and strategic importance of large-scale archives and datasets, the availability of these existing data should not reduce the capacity to gather targeted data as needed to address important program evaluation questions.

Evaluation Methods
The Commission is charged with making *"recommendations on how best to incorporate outcomes measurement, institutionalize randomized controlled trials, and rigorous impact analysis into program design."* We believe that the key to such evaluation activities is for federal entities, (including Congress, as well as Executive Branch agencies and the White House Office of Management and Budget (OMB)), to identify the important evaluation questions that they need answered to effectively direct the future of Federal programs. Such questions could be effectively embedded in authorizing legislation or in congressional committee reports associated with legislative authorizations or renewals. Executive Branch agencies can do so in their budget documents and implementation plans. Evaluators, in consultation with other experts, can then identify which scientific methods are best suited to answer those questions. Specifically defining program activities and expected outcomes has proven very useful in choosing relevant evaluation questions about program operations and impact.

Such questions, and associated evaluations, are needed throughout the life cycle of programs, from their initial authorization through all phases of their implementation. For example, during early stages in the life of programs, key questions might center on the fidelity of their implementation with statutory requirements and on early implementation problems and successes. As the program matures, decision makers might want to establish metrics to track such features as enrollment of intended beneficiaries or establishment of required administrative systems and other infrastructures. Gradually, interest may shift to outputs, in terms of benefits provided and beneficiaries served. Ultimately, decision makers and citizens will want information about the impact of programs on people's lives, the economy, public health, safety,

or other factors or goals associated with the purpose of the programs. Throughout the life of the programs, government officials and taxpayers will want to know if funds are being misspent or wasted.

While interest will ultimately focus on program impact and value received for investments made, citizens and decision makers do not want to wait until a program has run its course and then determine whether it has been working. Along the way, they will want to know if implementation problems can be corrected and whether the programs can be improved.

All of these questions are important. But the methods for answering them can be complex. Evaluation professionals have a broad range of methods—based on research— from which to draw on to answer both impact and operational process questions. Rather than legislating, requiring, or overemphasizing any single specific method for impact analysis in federal guidance, AEA recommends that federal policy require that careful consideration be given to a range of evaluation methods that may be appropriate or feasible in any given circumstance.

Over the years, the evaluation field has developed an extensive array of analytic approaches and methods that can be applied and adapted to a wide variety of programs and circumstances, depending on the program's characteristics and implementation stage, the way the results will be used, and the kinds of decisions that need to be made. In designing evaluation studies it is important to recognize that every method has pros and cons and strengths and weaknesses that must be addressed in matching them to answer the specific questions, circumstances, and intended uses of results. There are real-life factors which can render designs infeasible, impractical, or inappropriate. To ensure adequate deployment, every study design must examine and address feasibility constraints, including resources (funding and time limits), conditions in the field, ethical considerations, stakeholder concerns, etc. All evaluation methods should be context-sensitive and have cultural relevance.

Agencies should not only focus on tools for evaluation inquiry, but foster evaluation thinking as well. High-stakes program decisions should be based on a preponderance of evidence developed using sound methods. Some programs may need a high level of credibility and precision in the portfolio of evidence upon which leaders base a decision. This may require multiple studies and methods as well as a combination of process and impact evaluations to assess and understand the effectiveness of an approach within the portfolio of evidence. A range of analytic methods may be needed, and often several methods—including quantitative and qualitative approaches— should be used simultaneously. Multiple methods can offset the shortcomings of any one method with the strengths of another.

In fact, some decisions about how to improve the reach and impact of a given program may not require a high level of precision or a large portfolio of evidence. Some evaluation approaches are particularly helpful in a program's early developmental stages, whereas others are more suited to ongoing and regularly implemented programs or to ex-post analysis of temporary programs upon their completion. The broader policy and decision-making context also can influence which approach is most appropriate. Sometimes information is needed quickly, requiring studies that can use existing data or rapid data-collection methods; at other times, more sophisticated long-term studies are required to understand fully the dynamics of program

administration and beneficiary behaviors. Moreover, different approaches can complement one another.

The opportunity to capitalize on early successes, identify implementation impediments, or make mid-course corrections is critical. So it is essential to conduct ongoing formative evaluation throughout the program's life cycle. For example, evaluation can address questions that arise during implementation of the program, such as the validity of assumptions that underlie program design, or challenges to implementation in the field. Early in the program's history, relatively simple information may be needed quickly (e.g., regarding obstacles to participation in the program). Evaluators should match the methodology to the questions at each stage of program development and to information needs, which may call for a range of methods over time, including targeted data collection that may not always include outcomes measurement.

Today we see considerable interest in impact analyses, including randomized controlled trials. No doubt these are valuable tools and have their place. But we wish to emphasize that they represent only some of the methods that can and should be applied, depending on the questions that need to be answered. They are not intrinsically better than other methods, except in those circumstances where they are most appropriate and feasible. An overarching focus on these methods to the exclusion of others will deprive decision makers of valuable insights about ways to improve program effectiveness and efficiency, and, when appropriate, whether to increase or diminish program funding.

Most federal evaluations need to go beyond estimating aggregate impacts to also addressing "what works for whom, and under what circumstances." If the data from evaluation studies are to be of most use in guiding evidence-based decision making, they need to be able to support conclusions about how program impacts vary across subgroups of those affected by the programs and also conclusions about the contexts in which the specific program activities are most effective.

Numerous examples are available of evaluations that have enhanced the effectiveness and impact of programs but that were conducted early in the program's life. One that comes to mind is the evaluation conducted by the Institute of Medicine during the first five year of the PEPFAR program. This was done at the request of Congress, embedded in the original authorizing statute. It provided feedback on implementation issues that was available to decision makers at the time of the program's first reauthorization. It is fair to speculate that this early feedback contributed to the impact of that program from that time forward, and in many ways was as or more impactful than studies performed in later years.

Other studies can affect programs and their impacts when performed several years into their implementation. One example is a series of evaluations and audits that identified serious problems of service quality, cost, and fraud within Medicare's home health program. Based on those studies, the Congress reformed the structure of the program, leading to savings of some forty plus billions of dollars and the abandonment of participation in the program by many high risk providers. These impacts were verified by independent reviews conducted by the Government Accountability Office. It is especially noteworthy that it was not a single impact study that led to these reforms, but rather by a body of work spanning several years.

Many other evaluation studies that lead to improved program impact and efficiency are documented on the websites of various Federal Offices of Inspectors General. They illustrate the value of using a body of work and mixed methods to assess both implementation and effectiveness of federal programs.

Evaluation Capacity in Government Settings
AEA believes that all federal entities should have the ability and should be encouraged (and in some cases, required) to evaluate programs. However, each agency or department should develop structures and plans for their evaluation functions that are best suited to their missions, organizational structures, stakeholders, environments, timing of and need for evidence in decision making, and available resources.

Because evaluation should serve as an essential core function in good governance, agencies should be required to apply the findings and conclusions of evaluations to program design, management, reform, expansion, or termination—ensuring that policy formulation will be more open, consultative, and evidence-informed. Agencies should, to the extent practical, conduct impact evaluations on pilot programs before attempting to expand or replicate them.

A framework for the planning and conduct of evaluations should also include:
 a. A public evaluation policy statement
 b. A sound procedure for establishing annual and multi-year evaluation agendas and timetables
 c. Consultation with appropriate congressional committees, OMB, and other external program stakeholders on their information needs
 d. A dissemination plan, preferably with public access
 e. Resources needed to support evaluation, and
 f. Plans regarding how the findings and conclusions of evaluations shall be considered in subsequent program design, program management, and decisions regarding program reform, expansion, or termination.

The organizational structure of evaluation efforts is also important. Thus, it is vital to ensure an appropriate mixture of independence and collaboration between the evaluators and program offices with regard to evaluation design, conduct, and reporting. Consultation is needed to ensure relevance, but independence is needed to ensure impartiality. Depending on the unique organizational structure of each agency, an independent central evaluation office could be responsible for: developing and promoting program evaluation expertise throughout an agency; planning, conducting or procuring evaluation studies; and ensuring appropriate follow-up of evaluation findings and recommendations.

Adequate staffing of evaluation units and support for professional development is also necessary if the Commission's work is to achieve the kind of benefits foreseen by Congress. To ensure that decision makers use the evidence produced in evaluation studies, agencies should invest in training those staff responsible for program design, implementation, and management regarding the proper conduct of evaluation and the use of findings in program decision making.

Summary

1. Government decision makers must have appropriate credible evidence to make informed decisions regarding the structure and operations of federal agencies and policies, and to maximize their effectiveness and efficiency.

2. For key decision points within programs, federal entities (including Congress, executive branch agencies, and OMB), should identify important evaluation questions. Evaluators, in consultation with program officials, should select methods best suited to answer those questions.

3. All federal entities should have the authority and resources to conduct evaluations, and should be encouraged (and in some cases, required) to evaluate various programs. However, each agency or department should develop structures and plans for those evaluation functions best suited to their mission, organizational structure, stakeholders, environment, and timing of and need for evidence in decision making.

4. Recognizing the importance of assessing program effectiveness, the opportunity to capitalize on early successes or to make mid-course corrections is also critical. So it is essential also to conduct ongoing formative evaluation throughout the program's life cycle.

5. The proposed Evidence Clearinghouse should serve as a repository for the evidence contained in evaluation reports and as an archive for the collection, dissemination, and preservation of knowledge and lessons learned from evaluation studies.

The Education Trust
Presenter: Tiffany Jones

The Education Trust

**Closing the gaps in opportunity and
achievement, pre-k through college.**

Commission on Evidence-Based Policymaking – Public Hearing
Friday, October 21, 2016

Comments submitted by:
Tiffany Jones, Director of Higher Education Policy
The Education Trust

Abstract: The availability of high-quality, robust data systems is essential to helping the
public understand how students are faring at particular institutions, identifying equity
gaps, and better incentivizing improvement and success. Having better information on the
college participation and outcomes of all students also helps ensure that students can make
the best postsecondary decisions for themselves, with the billions of dollars that the federal
government annually invests in student aid. We believe that the most efficient and effective
way to gather complete and more honest data is through a (modified) unit record system,
and we support both an effort to eliminate the current student unit record ban and an
effort to expand and improve the current data collections, including, for example, data on
part-time students and transfers, and making Pell status transparent in the collections.

Oral and Written Statement:

Thank you for the opportunity to speak. My name is Tiffany Jones and I am the Director of
Higher Education Policy at The Education Trust. Ed Trust is committed to advancing
educational opportunities for all students, but especially low-income students and students
of color. We aim to advance equity in higher education by encouraging policymakers and
the public to hold campuses accountable for student outcomes and supporting
improvement at campuses committed to serving low-income students and students of
color.

Since the original Higher Education Act (HEA) was passed in 1965, the U.S. has made
substantial progress in college access. College-going rates have climbed for students from
all economic and racial groups. Yet despite this progress, low-income students today enroll
in postsecondary education at rates lower than high-income students did in the mid-1970s.
In every category of postsecondary education, low-income students and students of color
are less likely than others to earn the degrees that they want and need, and far more likely
to end up with debt and no degree.

Before disaggregation of data was required in K-12, we knew anecdotally that schools were
not educating all groups of students well. But we did not know just how significant the
inequities were, and we didn't know which schools were making progress and which
weren't.

That, unfortunately, is where we still are in higher education — especially in regard to low-income students. We have some limited research on, for example, overall Pell graduation rates, but we don't currently know which institutions are serving these students well and which aren't. Pell graduation rate data will be incorporated into IPEDS in the coming years, but to date these data have not been included in annual IPEDS data collections. IPEDS also doesn't include data on part-time students or students who don't start in the fall or students who transfer in from another college.

If we have learned anything from past experience, it is this: that students who aren't measured don't count. If you want these students to count, and I know you do, you need to make the same shift to demanding better data that you have made in K-12.

We believe that the most efficient and effective way to have complete and more honest data is through a (modified) unit record system. The current ban on a federal student unit record system makes it impossible for federal policymakers to get a comprehensive picture of how students are moving through postsecondary education and attaining degrees and certificates. The commission should recommend the overturn of the unit record ban and the ban on a federal database of WIOA data, so that we can have a nationwide, inclusive data set to show how people are moving through a variety of education pathways.

Creating a student unit record system can begin by leveraging existing resources from the U.S. Department of Education (which houses the National Student Loan Data System and Integrated Postsecondary Education Data System), Social Security Administration, the Department of Defense and Department of Veterans Affairs, among others, to create a more complete picture of the higher education landscape. These sources provide valuable data on important subgroups of students who are often overlooked, including Pell Grant recipients, student loan borrowers, and student veterans. If linked, these data would produce valuable information about enrollment and completion rates, and post-college employment and earnings.

We also support an effort to expand and improve the current data collections, including, for example, data on part-time students and transfers, and making Pell status transparent in the collections.

Thank you for having this hearing and taking an important and critical step toward advancing the quality and availability of higher education data — specifically, a step that ensures better data that can be used to empower students, families, the public, advocates, and campuses as we aim to increase higher education equity and student success.

I look forward to answering any questions.

H1_2016_10
October 21, 2016 Hearing
National Campaign to Prevent Teen and
Unplanned Pregnancy
Presenter: Kelleen Kaye

October 14, 2016

Dear Chair Katharine G. Abraham, Co-chair Ron Haskins, and members of the Commission:

On behalf of The National Campaign to Prevent Teen and Unplanned Pregnancy, thank you for the opportunity to submit a statement for the record for the Commission on Evidence-Based Policymaking (CEP) meeting to be held on October 21, 2016. The National Campaign, a research-based, nonpartisan, nonprofit organization was founded in 1996. We work to improve the lives and future prospects of children and families by ensuring that all children are born into families committed to and ready for the demanding task of raising the next generation by reducing unplanned pregnancy among teens and young adults. The National Campaign works towards three ultimate outcomes:

- Reduce the rate of teen pregnancy by 50% by 2026.
- Reduce the rate of unplanned pregnancy among women age 18-29 by 25% by 2026.
- Reduce the disparities in teen pregnancy and unplanned pregnancy rates among racial/ethnic and socioeconomic groups by 50% by 2026.

Ensuring that young people have access to high quality, evidence-based teen pregnancy prevention education is one critical element in helping more young people delay pregnancy and parenting.

Given our long-standing commitment to research, evidence and evaluation, we applaud the establishment of the Commission and appreciate the important issues it is tackling. In this statement, we offer feedback about several of the duties the Commission is tasked with, along with information about two tiered evidence-based programs—the Personal Responsibility Education Program (PREP) and the Teen Pregnancy Prevention (TPP) Program—which we hope will be helpful as the Commission goes about its important work.

The Commission poses several important questions with respect to data infrastructure and access, including a request for examples of best practices related to linking local, state and federal data. Not surprisingly, this type of endeavor raises many technological, ethical, and legal challenges, particularly as they relate to the balance between data access and privacy. One example that may be helpful to consider is the Longitudinal-Employer Household Dynamics (LEHD) program. We highlight this program for its ability to successfully navigate challenges associated with partnership formation, privacy protection, and data access while producing data that have greatly impacted policy.

Similarly, the Commission poses several questions related to the potential benefits and challenges of developing a clearinghouse for administrative and survey data. While The Campaign strongly supports greater access to administrative and survey data, and a

clearinghouse would be beneficial in theory, we believe such an effort would likely fall short of its goals and would be difficult to maintain. It is particularly difficult to imagine a single clearinghouse that gathered data and evidence across all policy domains in a way that adequately captured the complexities of these data and the programs they reflect. Rather, we believe those resources would be better committed to helping agencies maintain and enhance the data access they already have in place. In our experience, as these agencies try to meet growing data collection costs with fixed or even diminishing budgets, the availability of policy relevant data has been shrinking in critical ways. Key questions have been cut from surveys and online access to data has been curtailed. This is particularly true as it pertains to tabulating results for states or localities. For example, one can no longer use the online vital statistics data to look at key policy questions like variation in Medicaid or WIC participation at the state level. It is also the case that some particularly rich data, such as the Medicaid Max files, are not available as de-identified files, thus making them difficult to obtain and underutilized. There are likely similar limitations in other policy domains as well. We believe that with relatively modest investments and vocal champions, data access could be greatly expanded.

We also would like to comment on the Commission's interest in how data and findings from evaluations can best be used to improve policies and programs. We offer two examples of tiered evidence grant making from the US Department of Health and Human Services (HHS) that use evaluation results to continually improve those programs.

The TPP Program and PREP, like the Maternal, Infant and Early Childhood Home Visiting program, have been recognized as pioneering examples of tiered evidence-based policymaking,[i] and represent an important contribution to building a body of evidence of what works. They include high quality implementation, evaluation, innovation, and learning from results. The majority of funding from the TPP Program and PREP goes toward replicating program models that have been demonstrated to change behavior using well recognized high standards of evidence. A smaller portion of funding is reserved for research and demonstration projects to develop, replicate, refine, and test additional models and innovative strategies. This ensures that the menu of effective approaches to reducing teen pregnancy will continue to grow and be refined.

TPP Program and PREP grantees can choose from a list of effective models that have been identified through HHS' ongoing systematic review of the teen pregnancy prevention research literature. Since 2009, HHS has sponsored this review of the literature to help identify models with evidence of effectiveness in reducing teen pregnancy, sexually transmitted infections (STIs), and associated sexual risk behaviors. The review, conducted by Mathematica Policy Research, looked at hundreds of evaluations and initially identified 28 models that met Tier 1 criteria. That is, they must have been evaluated using a randomized controlled trial or quasi-experimental design, demonstrate changes in behavior (not just knowledge or behavioral intent), and results must be published in a peer-reviewed journal. The evidence review is updated periodically to capture the latest evaluation studies, and now includes 44 models.[ii] The wide range of models on the HHS list of evidence-based programs gives grantees the flexibility to choose an effective approach that reflects their needs, population, and values, recognizing that what people in New York City may choose for high school age teens might be different from what people in Mississippi choose for middle school youth.

The TPP Program is a discretionary program administered by the Office of Adolescent Health (OAH) that was originally funded in FY 2010 at $110 million. It supported an initial cohort of 102 grants for a five-year period. Funded at $101 million for FY 2016, the TPP Program currently supports 84 competitive grants to a broad range of organizations and agencies serving youth in 39 states and the Marshall Islands. The grantees focus intensely on communities with the highest teen birth rates and the most at-risk youth. These five-year grants were awarded in FY 2015 and are contingent on continued appropriations. As noted above, approximately 75% of the grant funds are used to replicate program models that have already been shown through careful evaluation to change teen behavior (Tier 1), and approximately 25% of the funds support research and demonstration projects to develop, replicate, refine, and test additional models and innovative strategies to prevent teen pregnancy (Tier 2).

PREP, established in FY 2010, continues to be funded at $75 million in mandatory funding annually through FY 2017. Administered by the Administration on Children and Families (ACF), PREP supports states, communities, and tribes to educate adolescents on both abstinence and contraception to prevent pregnancy and STIs, and on other adulthood preparation topics such as healthy relationships, communication with parents, and financial literacy. PREP focuses on youth at greatest risk of teen pregnancy and geographic areas with high teen birth rates. For example, 34% of grantees targeted youth in foster care and 74% target youth in high need areas.[iii] Most of the PREP funding ($58 million) supports grants to states, territories, and tribes and emphasizes the use of evidence-based programs. Indeed, more than 95% of youth served by the state grants received one of the evidence-based programs from the HHS list referenced above.[iv] An additional $10 million supports competitive grants to public and private entities to develop, replicate, refine, and evaluate innovative strategies to reduce teen pregnancy and repeat pregnancies among youth up to age 21. These grants are subject to rigorous evaluation and reflect a "Tier 2" approach that supports innovation, fills gaps in existing programs for underserved populations, and expands knowledge about what works.

Both programs have invested heavily in the highest standards of evaluation and learning, as well as in innovation. OAH funded 41 rigorous evaluations during the first round of TPP Program grants that ran from 2010-2014.[v] The recently released findings—90% of which were from randomized control trials—indicate that four of the Tier 1 programs were found effective in changing behavior in additional settings and new populations. Among the Tier 2 grantees, 8 new, innovative models were found to be effective. Overall, these evaluations help build a body of evidence about where, when, and with whom specific models are most effective, and have expanded the menu of effective program models from which communities can choose. The results, along with implementation lessons, also help guide the second round of TPP Program grantees, and the many communities that look to the HHS list of evidence-based programs for guidance on what approaches will work best for them. Many of these findings and valuable implementation lessons were recently published in a special supplement of the *American Journal of Public Health*.[vi] PREP grantees have also been subjected to rigorous evaluations through several different federally sponsored studies, and several studies have already been added to the HHS evidence review.

The commitment to evidence-based investments and innovation in the area of teen pregnancy prevention has been pivotal in changing the landscape. Before these two programs began, there

were no federal investments dedicated to evidence-based teen pregnancy prevention programs; research in this area had primarily come from private investments, with few resources available to replicate or further evaluate the existing models.

The National Campaign also offers PREP and the TPP program as two examples where evaluation—specifically randomized control trials and quasi-experimental designs— have been successfully incorporated into the program designs. These are two of the few government programs that use evidence and evaluation criteria throughout the grant life cycle.[vii] In fact, only about $1 out of every $100 spent on federal programs is backed by any evidence that the money is being spent wisely.

We believe rigorous evaluations have been successfully implemented for a few reasons. Importantly, the legislation for both programs specifies that some portion of funds should be used for evaluation. Program requirements also signify that evaluations are a priority. For instance, PREP grantees must participate in a federally-led evaluation, if chosen, and the "Tier 2" innovation grantees are required to conduct their own rigorous evaluations, unless selected to be part of a federally-led evaluation. All TPP Program grantees are required to conduct some program evaluation, with a subset selected for rigorous impact evaluation.[viii] In addition, there are several federally-led evaluation studies that include large, multi-state, rigorous evaluations conducted under contract to OAH.[ix] Besides rigorous evaluations, mandatory reporting of performance measures is another way that OAH and ACF ensure grant projects are making sufficient progress toward their stated missions and that there is continuous quality improvement.

Of course, providing support for grantees is another vital component to ensuring evaluations are successful. From review of initial evaluation designs to preparation of the final evaluation reports, TPP Program and PREP grantees received ongoing evaluation training and technical assistance support to ensure rigorous methods and reporting.[x, xi] In addition, it is essential to have a commitment to evaluation and learning from program leadership and adequate federal staff capacity to carry out that commitment. Leadership at OAH and at ACF demonstrated such commitment, built staff capacity, and worked closely with evaluation experts at the ACF Office of Planning, Research and Evaluation (OPRE) and the Office of the Assistant Secretary for Planning and Evaluation (ASPE).

In closing, thank you for considering our input for the Commission for Evidence-Based Policymaking. If you have any questions or need additional information, please contact me at 202-478-8512 or kkaye@thenc.org.

Sincerely,

Kelleen Kaye
Vice President, Research and
Evaluation

Commission on Evidence-Based Policymaking (CEP)
First Public Hearing: Friday, October 21, 2016

Comments Submitted by

Christine M Keller, PhD
Association of Public & Land-grant Universities (APLU)
Vice President, Research and Policy Analysis
ckeller@aplu.org

</div>

Abstract: *The most significant barrier for evidence-based policymaking and decisions within higher education is the ban within the Higher Education Opportunity Act of 2008 that prohibits the Department of Education from collecting student-level data for postsecondary students.   The lack of national student-level data prevents the Department from calculating comprehensive progress and completion outcomes for students as they move across different higher education institutions, especially as they cross state boundaries. It also prevents the linking of postsecondary data with federal data from other agencies that would allow better evidence of outcomes after college (e.g., earnings, employment) as well as outcomes for students in key federally-funded programs (e.g., Pell grants, veterans benefits). The result is that students and families are left in the dark as they make the critical decision of which college or university is the right fit; policymakers struggle to appropriately hold accountable institutions receiving taxpayer dollars; and institutions lack the information they need to assess their performance and improve.*

Oral and Written Statement
Co-chairs Abraham and Haskins and distinguished members of the Commission, thank you for the opportunity to submit comments for your consideration during this hearing. My name is Christine Keller and I am the Vice President of Research and Policy Analysis at the Association of Public and Land-grant Universities (APLU). APLU is a research, policy, and advocacy organization dedicated to strengthening and advancing the work of public universities in North America.

A top priority for APLU is to foster the widespread use of data and evidence to support decision-making - on university campuses and as the basis for sound and effective federal policy. APLU believes the most significant barrier for evidence-based policymaking and decisions within higher education is the ban that prohibits the Department of Education from collecting individual-level data for postsecondary students (Higher Education Opportunity Act of 2008). Lifting the ban in order to create a limited federal postsecondary student-level data system would produce more accurate details of student enrollment patterns, progression, completion, and post-collegiate outcomes. Such a system would assist with national priorities such as providing students and their families with more complete and accurate information when selecting a college. And better ensure that policymakers can appropriately allocate public resources and evaluate program effectiveness.

A student-level postsecondary data system would address one of the most significant shortfalls of the current institution-level data collections within the Department of Education – the inability to accurately report the

progress and completion of all students across multiple institutions and state boundaries. The current federal graduation rate only reports the completion of full-time students who start and finish at their first institution. Students who start their studies part-time or transfer institutions are not reported in the federal rate. Data from the National Student Clearinghouse demonstrate that these students comprise an increasingly large proportion of today's students. Sixty-four (64) percent of bachelor's degree recipients from public universities attend more than one institution before graduation and more than 60 percent of community college students attend part-time. Yet these students are missing from the federal graduation rate.

The Department of Education, to its credit, has made multiple attempts to address these shortcoming within the constraints of an institutional level collection. However, the information provided remains inadequate for consumers and policymakers, adds reporting burden for institutions, and, the latest attempt was judged too unreliable by the Department of Education to release the data publicly after the first year of collection. A student-level data collection would simplify the creation of progress and outcomes measures as well as increase reliability and consistency of the metrics across institutions.

A second significant shortfall of the current postsecondary data is the inability to create linkages between postsecondary education data and other federal data systems. Linking with other federal data systems would harness the data already collected through other agencies to provide key information such as employment and earnings after college for all students.   Progress and completion rates could be reliably and accurately calculated for student participating in federal programs such as Pell grants or GI Benefits. Combining information across federal agencies would streamline data collection, minimize duplicate reporting by institutions, and reduce the chance of errors in the resulting metrics.

Any student-level data system must include a robust set of protections and protocols to safeguard student data from unauthorized use or disclosures and to secure its collection and storage. Policies and procedures to protect data must be transparent and utilize evolving best practices for data security to address real and legitimate concerns about privacy and security, but privacy and security should not be used as an excuse for blocking transparency and access to more complete data.

Following are two specific examples from APLU members that illustrate why lifting the ban to create a system with more comprehensive and accurate data is a top priority for our association.

Example 1: Student Achievement Measure
As I mentioned earlier, the current federal graduation rate only includes first-time, full-time students who start and finish at their first institution. To help fill the data gaps in the federal system, the higher education community created **the Student Achievement Measure** (www.studentachievementmeasure.org) or SAM. SAM is a voluntary initiative that allows institutions to report the progress and completion of full-time, part-time, and transfer students. Over 600 colleges and universities from all 50 states and the District of Columbia are participating in SAM and reporting the outcomes of 600,000 more students than the federal government's measure.

One of the SAM participants is the University of North Texas. The federal graduation rate for UNT shows that just under half of first-time, full-time student who started in Fall 2009 graduated within 6 years. With only the information provided by the federal graduation rate, it appears that the other half of the students who started at the University of North Texas failed. However, by using the SAM methodology, UNT is able to show that another 13% of students graduated from another institution and another 14% are still enrolled pursuing their degree, for a total of 76% students who have graduated or are still enrolled.

SAM also reports the outcomes for the nearly 3,000 students who started at the University of North Texas as transfer students in Fall 2009 and are missing from the federal **rate** – 80% have graduated or are still enrolled after 6 years. All totaled, SAM includes another 3,000 of the University of North Texas's students who are not included in federal graduation rate.

SAM provides a powerful model of the type of information that would be available if the ban on collection of student-level data were lifted. However, SAM is not a substitute for a federal student-level data system. SAM is voluntary and does not include all postsecondary institutions. Nor is SAM the official data included in the U.S. Department of Education's College Scorecard, the U.S. Department of Veterans Affairs' college comparison tool, or other consumer information tools. A more complete federal solution is still needed.

Example #2: University of Texas System
A second example comes from the University of Texas System. The UT System has demonstrated the usefulness of student-level data as part of their consumer information tool – seekUT (http://utsystem.edu/seekut/). By combining student-level data and the state workforce data, the UT System is able to present information such as the average cumulative student loan debt and median earnings at one, five, and ten years post-graduation for students graduating from specific programs at the UT institutions.

However, as useful and powerful as having earnings data at the state level has been, there were key limitations that hindered the UT System's ability to answer critical questions. Without a federal postsecondary data solution they were limited to data for those graduates that remained in Texas after graduation and unable to account for the earnings of graduates that move out of state. UT System administrators recognized that they needed national data across all states to evaluate and improve academic programs. And provide students with more comprehensive employment and earnings information to show a realistic picture of earnings after graduation. This information would help students make more informed decisions about their choice of majors and appropriate amounts of debt.

In fact, the UT System felt that national employment and earnings data would be of such high value that they recently finalized an agreement with the US Census Bureau to provide national post-college outcomes for UT graduates through a pilot research project.   The Census-UT System collaboration is an important demonstration of how higher education and federal agencies can break down silos and work together. Imagine how valuable would it be if all colleges and universities and state systems could have access to similar information to support institutional evaluation and improvement and student decision-making – without each entity negotiating a separate agreement?   A national student-level data system could help all institutions more readily reach that goal.

In sum, lifting the ban on the collection of student-level postsecondary data would provide access to more comprehensive, meaningful data and allow for the better alignment and integration with other federal data systems. The results would strengthen the federal government's ability to provide essential information on higher education – for student and families to make more informed decisions about where to attend college; for policymakers to determine allocations of public resources and evaluate program effectiveness; and for college leaders to develop institutional policies and practices that support successful outcomes for all students.

As the Commission continues to develop a strategy for increasing the availability, alignment, and use of high quality data to inform policy and decision-making, we encourage your consideration of the acute need for more accurate and complete postsecondary data for all users.

APLU is a research, policy, and advocacy organization dedicated to strengthening and advancing the work of public universities in the U.S., Canada, and Mexico. With a membership of 236 public research universities, land-grant institutions, state university systems, and affiliated organizations, APLU's agenda is built on the three pillars of increasing degree completion and academic success, advancing scientific research, and expanding engagement. Annually, its 194 U.S. member campuses enroll 3.9 million undergraduates and 1.2 million graduate students, award 1 million degrees, employ 1 million faculty and staff, and conduct $40.2 billion in university-based research.

American Principles Project
Presenter: Emmett McGroarty

</div>

American Principles Project

Abstract: We urge the Commission to resist calls to repeal the statutory prohibition on the development, implementation, or maintenance of a federal student unit-record system. Such a system would curtail liberty interests of the individual, would invite the collection and use of ever-more data, and would fundamentally alter the relationship between the individual and government in a way that is incompatible with our constitutional republic.

Statement by Emmett J. McGroarty, JD
Before the Commission on Evidence-Based Policymaking

The Commission on Evidence-Based Policymaking was created to pursue a laudable goal: To improve analysis of the effectiveness of federal programs.[1] But when such a pursuit is used to justify collecting, conglomerating, and tracking massive amounts of Americans' personal data, as is certainly true in the realm of education, it's necessary to examine the dangers and the tradeoffs. American Principles Project (APP) believes that such activities suppress the liberties of the people and pervert the relationship between the people and government. We urge the Commission to reject calls to establish a federal student unit-record system and to engage in such Orwellian activity.

Section 134 of the Higher Education Act wisely prohibits the development, implementation, or maintenance of a federal student unit-record system (one that would allow the government to collect personally identifiable information (PII) on individual higher-education students and link education data to workforce data).[2] Recently, though, an orchestrated demand for repeal of this prohibition has been swelling.[3]

According to well-funded organizations[4] with a vested interest in accessing that data for their own purposes, the federal government suffers from data-deprivation. Think how much more efficiently our nation could operate, and how much more the government could help people run their own lives, if it maintained a centralized repository tracking almost every conceivable data point about every citizen – where he attended school, what courses he took, what grades he earned, what extracurricular record (good or bad) he compiled, what jobs he applied for, what jobs he got, what salary he made, whether he was promoted, what salary he earned in his new position, whether he lost his job and why, whether he joined the military, what sort of

military record he established, whether he was arrested and for what, whether he went to jail, and on and on *ad infinitum.*

This is not a description of a free and open United States of America. This is a description of a totalitarian society that keeps tabs on its own citizens – for their own good, of course. It's also a description of what would inevitably happen with the establishment of a student unit-record system, all in the name of "better consumer information," "accountability," and "transparency."

What's wrong with a federal unit-tracking system?

First, it would compile students' personally identifiable information (PII) without their consent – or even their knowledge that their data is being collected and disclosed. It's one thing to collect data from a student who voluntarily (which of course presumes actual notice of the program) participates in a government program and understands that participation will expose his PII to program administrators; it's quite another to forcibly suck every individual into a data-collection system simply because he enrolled in an institution of higher education. Telling that student that he must hand over his personal data to promote a greater good as defined by bureaucrats and lobbyists – or even worse, just dragooning him without telling him anything – is simply un-American.

Second, the purposes of the proposed system would be so open-ended that the repository is certain to be expanded over time to centralize data far beyond collegiate and employment data. In the creative bureaucratic mind, literally everything can be linked to education. So why stop with employment data? Why not see how one's education affects his participation in the military? Or his health? Or his criminality? Or his housing patterns? Or the number of children he has? Or whether he purchases a gun? Or his political activity? Inquiring bureaucrats want to know, and every question can be justified by citing "better consumer information."

And will this dossier created on every citizen become permanent? Presumably so. If the goal of providing maximum consumer information is to be achieved, both historical and current data – constantly updated and expanded – must be compiled and preserved.

Perhaps this expansion won't happen. Perhaps the federal government, in stark contrast to its behavior over the last 100 years, will stay within its boundaries. But reality-based Americans know the government will push the envelope as far as it possibly can, as it always does. And they know that giving that government access to such a treasure trove of data is dangerous to privacy and to individual liberty.

Third, the idea that this massive repository of PII will be protected against unauthorized access and data breaches is quite simply delusional. Less than a year ago, a hearing of the House Committee on Government Oversight and Reform[5] revealed the shocking lack of student-data

---

[5] U.S. Department of Education: Information Security Review" (Nov. 17, 2015), *available at* https://oversight.house.gov/hearing/u-s-department-of-education-information-security-review/.

security throughout the U.S. Department of Education (USED). The problems encompass both lax controls over the people allowed access to sensitive data, as well as outdated technology and inadequate security to prevent unauthorized access.

USED's system contains over 139 million Social Security numbers (largely through its office of Financial Student Aid), along with sensitive borrower information about students and families contained in the National Student Loan Database. The findings of the Office of the Inspector General (OIG) and the General Accounting Office were disturbing:

- Of the 97,000 account/users with access to this information (government employees and contractors), fewer than 20 percent have undergone a background check to receive a security clearance.
- The security mechanisms protecting that data are grossly inadequate. As one OIG witness testified, "During our testing . . . OIG testers were able to gain full access to the Department's network and our access went undetected by Dell [the vendor] and the Department's Office of the Chief Information Officer."
- USED ignored repeated warnings from OIG that its information systems are vulnerable to security threats.

That the federal government should now consider ballooning the sensitive data contained in these insecure systems is at best misguided and reckless.

Even if the data systems were secure, the Obama administration's gutting of the Family Educational Rights and Privacy Act (FERPA) means that government education officials (federal, state, and local) now have enormous leeway to disclose PII on individual students without their consent. Pursuant to the recent FERPA regulations, these officials may share private PII with other government agencies, nonprofit entities, corporations, researchers, and literally anyone on the planet as long as the disclosure can be characterized as an audit or evaluation of a (broadly defined) "education program."[6]

Will the new conglomeration of student data be fair game for disclosure under these regulations? The danger is too real to dismiss.

The philosophical problem with a federal student unit-record system is that it treats free-born American citizens as objects of research and study. It assumes that the goal of benefitting others in society, in vague and theoretical ways, authorizes the powerful federal government to collect and disseminate millions of data points on individuals – without their consent. This fundamentally changes the relationship between the individual and government. Collecting and holding massive amounts of data about an individual has an intimidating effect on the individual—even if the data is never used. This is even more so the case when the collector has

Dr. Katharine G. Abraham, Chair
Mr. Ron Haskins, Co-Chair
Evidence-Based Policymaking Commission
U.S. Census Bureau
4600 Silver Hill Road
Suitland, MD 20746

Dear Chairwoman Abraham and Co-Chairman Haskins,

We are writing to encourage you to consider including the attached policy recommendations in your final report to Congress and the Administration.

We believe that the Commission can help invest taxpayer dollars in what works by assisting policymakers at all levels of government in:

- Building evidence about the practices, policies and programs that will achieve the most effective and efficient results so that policymakers can make better decisions;
- Investing limited taxpayer dollars in practices, policies and programs that use data, evidence and evaluation to demonstrate they work; and
- Directing funds away from practices, policies, and programs that consistently fail to achieve measurable outcomes.

Although the Evidence-Based Policymaking Commission Act of 2016 directs the Commission to study and report on several important topics including data privacy and data sharing, our attached policy proposals focus on the provision that directs the Commission to "make recommendations on how best to incorporate outcomes measurement, institutionalize randomized controlled trials, and rigorous impact analysis into program design."

We thank you in advance for your consideration of our recommendations.

Sincerely,

INVEST IN WHAT WORKS COALITION RECOMMENDATIONS

Data Collection

- **Federal Data Infrastructure**: The Commission should consider recommending that Congress and the Administration provide sufficient funding to help the U.S. Census Bureau accelerate the process of acquiring key administrative data-sets from local, state, and federal agencies, and strengthen its infrastructure for processing, standardizing, linking, and making data available to other government agencies and independent researchers via data use agreements with strong privacy protections. As part of this effort, the Census Bureau should develop an inventory of data-sets at the local, state, and federal levels and make this inventory accessible to government agencies and independent researchers.

- **Federal Data Inventories**: The Commission should consider recommending that Congress and the Administration codify into law what is already required by the May 2013 Executive Order by passing the OPEN Government Data Act. This legislation would mandate that every federal agency create an enterprise data inventory of all data sets held by the agency and make these lists public in machine-readable formats with strong privacy protections.

- **Federal Data Information Technology:** The Commission should consider recommending that Congress and the Administration provide sufficient funding to allow every federal agency to update and modernize its IT infrastructure that supports data collection, analysis, sharing, and usage so that data can be appropriately structured, protected, analyzed and disclosed in line with the updated information policy of the United States. A 2016 report by the U.S. General Accountability Office highlighted the urgent need for the U.S. government to modernize its aging legacy systems.

- **Workforce Data**: The Commission should recommend that Congress and the Administration allow the linking of workforce datasets (including but not limited to state and federal unemployment insurance and new hires data sets) to improve the effectiveness and efficiency of publicly-supported workforce development programs, as long as the linking is consistent with strong privacy protections. For example, many states cannot determine the impact of their job training programs without the ability to link their participant information with information about wage earnings across multiple states where participants obtain employment.

- **State Education and Workforce Data Systems**: The Commission should recommend that Congress and the Administration support the enhancement of the existing State Longitudinal Data Systems (SLDS) program administered by the U.S. Department of Education, which helps states integrate education and workforce data, and the proposed expansion of the Workforce Data Quality Initiative that would help build state and local capacity to track employment and educational outcomes of Workforce Innovation and Opportunity Act program participants, including those with disabilities, and provide information about job success rates and training programs.

- **Federal Education Data Identifiers**: The Commission should consider recommending that Congress and the Administration direct federal agencies to standardize the way they collect

and share student-level identifiers (e.g., de-identified but encrypted) so that researchers can more effectively evaluate publicly-supported education and workforce development programs. This information should be housed in one federal agency in order to promote appropriate sharing and usage of this standardized data.

- **Federal Programmatic Data:** The Commission should consider recommending that Congress and the Administration authorize every federal agency to set aside 1% of their program funds for program evaluations that generate programmatic outcomes data that can help make federal programs more effective and efficient.

Data Analysis

- **Data Leadership and Infrastructure**: The Commission should consider recommending that Congress and the Administration direct every federal agency to have a senior staff member (i.e., Chief Evaluation Officer or equivalent position) with the authority, staff, and budget to develop important programmatic data through the evaluation of its major programs and to use this programmatic data and available administrative data to inform the agency's policies and improve its programs.

Data Sharing

- **Local and State Data Systems**: The Commission should consider recommending that Congress and the Administration clarify that local and state agencies can invest federal program funds in strengthening their data infrastructures for processing, standardizing, linking, and making data available to other government agencies and independent researchers via data use agreements with strong privacy protections.

- **Federal Education Data Infrastructure:** The Commission should consider recommending that Congress and the Administration strengthen the U.S. Department of Education's (ED's) data infrastructure, including the hiring and training of key analytic staff, to manage the collection, quality, release, and analysis of education data with strong privacy protections and the support the proposed InformED initiative that would pull together ED's diverse array of data and studies on a particular topic, and allow open data access to help unlock answers to pressing education questions and needs.

Data Usage

- "**What Works" Clearinghouses:** The Commission should consider recommending that Congress and the Administration direct every federal agency to develop a "What Works" clearinghouse or evidence exchange with the purpose of making evaluation reports available to the public.

- **Performance Management/Continuous Improvement:** The Commission should consider recommending that Congress and the Administration direct every federal agency to develop and operate a performance management system with clear and prioritized outcome-focused

goals and aligned program objectives and that frequently collects, analyzes, and uses administrative and programmatic outcomes data to improve outcomes, return on investment, and other dimensions of performance.

- **Federal Grant Programs**: The Commission should consider recommending that Congress and the Administration direct every federal agency to use evidence of effectiveness, including impact analysis and other outcomes measurements based on high-quality administrative and programmatic outcomes data, when allocating funds from its 5 largest competitive and non-competitive grant programs.

- **Evaluation and Research**: The Commission should consider recommending that Congress and the Administration direct every federal agency to have an evaluation policy, evaluation plan, and research/learning agenda which ensures that the agency has an intentional approach to the collection, analysis, sharing, and usage of administrative and programmatic data and publicly release the findings of all completed evaluations to improve the effectiveness and efficiency of federal programs.

- **Repurpose for Results**: The Commission should consider recommending that Congress and the Administration direct every federal agency to use its administrative and programmatic data to determine when to shift funds away from practices, policies, and programs which consistently fail to achieve desired outcomes and toward evidence-based, results-driven solutions.

MONEYBALL FOR GOVERNMENT PRINCIPLES

Government at all levels should help improve outcomes for young people, their families, and communities by:

- Building evidence about the practices, policies and programs that will achieve the most effective and efficient results so that policymakers can make better decisions;
- Investing limited taxpayer dollars in practices, policies and programs that use data, evidence and evaluation to demonstrate they work; and
- Directing funds away from practices, policies, and programs that consistently fail to achieve measurable outcomes.

MONEYBALL FOR GOVERNMENT ALL STARS

The following 126 local, state, and national leaders from across the political spectrum support the Moneyball for Government Principles and have agreed to be publicly identified as Moneyball for Government All-Stars:

Founding All-Stars: Michael Bloomberg (Former Mayor, New York City); Peter Orszag (Former Director, Office of Management and Budget under President Obama); Jim Nussle (Former U.S. Rep., R-IA; Former U.S. House Budget Committee Chairman; and Former Director, White House Office of Management and Budget under President G.W. Bush); Melody Barnes (Former Director, White House Domestic Policy Council under President Obama); and John Bridgeland (Former Director, White House Domestic Policy Council under President G.W. Bush);

Federal All-Stars: U.S. Senator Kelly Ayotte (R-NH); U.S. Senator Michael Bennet (D-CO); U.S. Senator Orrin Hatch (R-UT); U.S. Senator Jeanne Shaheen (D-NH); U.S. Senator Mark Warner (D-VA); Former U.S. Senator Mary Landrieu (D-LA); Speaker of the U.S. House of Representatives Paul Ryan (R-WI); U.S. Representative Todd Young (R-IN); U.S. Representative John Delaney (D-MD); Gene Sperling (Former Director, White House National Economic Council under Presidents Obama and Clinton); Austan Goolsbee (Former Chairman, White House Council of Economic Advisors under President Obama); Richard Riley (Former U.S. Secretary of Education under President Clinton); Robert E. Rubin (Former Secretary of the U.S. Treasury Department under President Clinton); Henry Paulson (Former Secretary of the U.S. Treasury Department under President G. W. Bush); Margaret Spellings (Former U.S. Secretary of Education under President G.W. Bush); Glenn Hubbard (Former Chairman, White House Council of Economic Advisers under President G.W. Bush); Laura D. Tyson (Former Chair, President's Council of Economic Advisers, and former White House National Economic Council Director); and Roger Porter (Former Assistant to the President for Economic

and Domestic Policy under President George H.W. Bush; former Director, White House Office of Policy Development under President Reagan; and former Executive Secretary of the President's Economic Policy Board under President Ford);

State All-Star: VA Governor Terry McAuliffe;

Local All-Stars: Richard J. Berry (Mayor of Albuquerque); Kasim Reed (Mayor of Atlanta); Stephanie Rawlings-Blake (Mayor of Baltimore); Martin Walsh (Mayor of Boston); Michael Hancock (Mayor of Denver); Karen Freeman-Wilson (Mayor of Gary); Stephen Goldsmith (Former Mayor of Indianapolis); Sly James (Mayor of Kansas City); Eric Garcetti (Mayor of Los Angeles); Greg Fischer (Mayor of Louisville); Mitch Landrieu (Mayor of New Orleans); Bill de Blasio (Mayor of New York City); Michael Nutter (Former Mayor of Philadelphia); Angel Taveras (Former Mayor of Providence); Ben McAdams (Mayor of Salt Lake County); Julian Castro (Former Mayor of San Antonio; current Secretary, U.S. Department of Housing and Urban Development); and Ed Murray (Mayor of Seattle);

Non-Profit All-Stars: 85 non-profit CEOs, presidents, and executive directors also support our Moneyball for Government Principles.

What Works Cities

What Works Cities is a national initiative working with cities across the country to enhance their use of data and evidence to engage residents, make government more effective and improve lives.

Launched in April 2015, What Works Cities is one of the largest-ever philanthropic efforts to improve local governments' data and evidence practices and was named by Forbes as "one of the biggest philanthropic bets on social change from 2015."

Through world-class partners, the initiative provides technical assistance to cities with populations between 100,000 and 1,000,000 that are committed and excited to improve the way they use data in governance. What Works Cities collaborates with participating municipalities to review their current use of data and evidence, understand where they are utilizing best practices and identify areas for growth. What Works Cities then designs a customized approach to help mayors and city leaders use data and evidence to address a variety of local issues, including economic development and job creation, public health, and social services.

What Works Cities' support is guided by the **WWC Standard,** which reflects a set of principles and systems that create a strong foundation for the effective use of data and evidence in city government. The components of the WWC Standard reflect the kinds of work city leaders have taken on across the United States to advance What Works practices in their cities:

1	2	3	4
Commit	**Measure**	**Take Stock**	**Act**
What Works leaders make powerful, public commitments to getting better results for their residents by using data and evidence.	What Works cities advance toward goals by measuring progress and outcomes, prioritizing transparency, and using appropriate tools.	What Works Cities leaders consistently review and reflect to measure progress, learn, and make adjustments and improvements.	What Works Cities leaders use data and evidence to inform major decisions and take action.

What Works Cities

As of April 2016, 39 cities in 25 states have been selected to join the initiative.

Our cities represent a diverse cross-section of the country, demonstrating that all types of cities can be What Works Cities. Many of these local governments have already made substantial progress through their work with What Works Cities by passing open data policies, engaging the public with city data, launching performance analytics programs to define and track progress on city goals, and undertaking new efforts to evaluate programs and manage contracts more effectively.

Participating cities receive expert guidance and technical assistance from What Works Cities' partner organizations:

- **Results for America** ensures a world-class experience for all participating cities, coordinates the operations of the What Works Cities initiative, and advances a nationwide dialogue on the need for cities to use data and evidence in decision-making.
- **The Center for Government Excellence at Johns Hopkins University** works with cities to assess the current state of What Works practices, and supports implementation and enhancement of open data and performance analytics programs.
- **The Government Performance Lab at the Harvard Kennedy School** supports cities in improving the results they achieve with their contracted dollars.
- **The Sunlight Foundation** helps cities craft meaningful and sustainable open data policies.
- **The Behavioral Insights Team** helps cities conduct rapid, low-cost evaluations of programs so they can continually improve city services.

What Works Cities is also creating a growing community of cities that share learnings and best practices that will continue long after the technical assistance has ended. We are building a movement of cities around the country that are demonstrating how powerful these practices can be in improving the strength of cities and the lives of their residents.

October 21, 2016

To the Commissioners on Evidence-Based Policymaking:

As a long-time trusted partner to the United States Government, Booz Allen Hamilton welcomes and appreciates the bipartisan effort to improve services to the American citizen by increasing the availability and use of government data to compile evidence and inform program policy design and implementation. In the spirit of Open Government and collaboration, we appreciate the opportunity to review and provide comments on the Commission's top considerations in its mission to strengthen the government's evidence-building efforts.

Through years of close connection with public sector clients, we have observed the lingering barriers to data-driven insights – for example, the exceedingly difficult nature of linking disparate public datasets, the need for significant coordination across multiple agencies to extract meaningful insights from data, shortages of data management and data science skills, challenges with privacy and risk related to data, the ability to adopt data operations and technology, and cultural resistance to change. We understand the concerns of both data providers and data consumers, and recognize the need for a range of expertise from the policy level down to infrastructure. Attached is the synopsis of our point of view on evidence-based policymaking.

We appreciate the opportunity to respond to this exciting and innovative initiative. We look forward to a continued dialog with the Commission on strategies to increase the availability and use of government data, and to offer best practices and share lessons learned from our experiences in overcoming the challenges of data-driven initiatives. We hope to partner with you all to continue to refine and develop this approach as you move forward with your recommendations.

Sincerely,

BOOZ ALLEN HAMILTON INC.

RK Paleru,
Principal

Enclosure

Submission to the Commission on Evidence-Based Policymaking

(Booz Allen Hamilton's Point of View)

The U.S. Federal Government relies on evidence-based policy development, execution, and evaluation to maximize policy effectiveness and socio-economic value delivered to citizens. Such an approach to evidence-based policymaking (EBPM) is currently undergoing transformation, driven by: the increased desire of experts across academia, the nonprofit community, and research institutions to access and link statistical data for effective analysis in support of policy decisions; the greater need for government accountability in program spending and evaluation; and the pace of change in data-related technology that is enabling secure exchange, storage, processing, analysis, and visualization of insights. Such data-driven initiatives – while leading to better policy decisions, program effectiveness, and increased return on government spending – pose significant privacy risks through the potential loss of personally identifiable information (PII).

Government agencies generate two types of data: administrative data, generated as part of fulfilling their respective missions; and survey data, generated as part of collecting information directly from citizens and businesses. When deployed, linked, and analyzed together, these datasets have the huge potential to transform research evaluation and policymaking. In this context, the recent government legislation on HR 1831 to set up a commission to evaluate and recommend best practices in EBPM is a great step forward and one in which Booz Allen Hamilton completely supports. This point of view document highlights some of Booz Allen's perspectives on the topic of EBPM, categorized across three dimensions: Program Effectiveness and Policy, Data Clearinghouse, and Privacy and Security.

Program Effectiveness and Policy

- <u>Linking Administrative and Survey Data</u>. Any government policy serving the needs of civil society could have administrative impact across multiple government agencies and programs. However, the data that support such policies and programs often reside in agency silos with limited scope and little impact for cross-government effectiveness. Unleashing such information will lead to better policymaking and governance. For example, eligibility and participation data tracked by the Social Security Administration – when combined with taxpayer data on income and tax subsidies from the IRS, survey data from the U.S. Census Bureau, and data from other agencies, such as HHS and HUD – could exponentially increase our ability to ask questions that have never been asked before and enhance our potential to draw insights that could not have been derived before.

- <u>Government Accountability</u>. Government agencies have to go beyond programmatic evaluation and start linking spending data with the economic value derived. For example, to increase transparency in federal spending, the Digital Accountability and Transparency Act (DATA) has mandated all government agencies to consolidate and publish government spending. It is a logical next step that such spending-related information is linked with

program performance data to enable cost-benefit analyses and better direct the application of government funding to programs.

- <u>Public-Private Partnerships</u>. Government agencies are constrained by budgets and resources to support comprehensive research and analysis of government programs. For example, data scientists – who have the ability to crunch large datasets to generate insights – are not available within the government at the scale necessary to support such comprehensive research. Partnerships serve as a "force multiplier" providing opportunities to share resources and responsibilities amongst government, academic, non-profit, and private entities to provide mutual support in research and policymaking.

Data Clearinghouse

- <u>Centralized Data Hub</u>. At the core of EBPM is the ability to build and operate a data clearinghouse (i.e., a centralized data hub) that is robust, secure, and scalable to accept large datasets from multiple providers. This hub should be built utilizing standardized information exchange formats that make the process of collection, ingestion, storage, processing, linking, and dissemination of data seamless. The centralized data hub should serve the analytical needs of a diverse set of policy researchers and subject matter experts by allowing controlled access to data using sophisticated mechanisms in conformance with established data-sharing agreements and policies.

- <u>Data Operations</u>. Maintaining a minimum-touch, fully integrated, highly secure and automated data operations capability is critical for serving the needs of stakeholders. Such a capability would include maintaining robust data catalogues, metadata management tools, data-sharing agreements, policy agreements, and data exchange standards to facilitate data sharing. Given the analytical rigor in research, data operations capabilities should also place emphasis on data quality standards, data governance, and stewardship.

- <u>Self-Service Capabilities</u>. Program evaluation requires identifying the right stakeholders, the context of their policy research, and access to data through self-service capabilities. Meaningful insights from data that drive the effectiveness of programs and outcomes would require self-service tools and analytics capabilities to explore, curate, cleanse, collaborate, and share insights within policy research communities with shared goals. In particular, the self-service capabilities should support descriptive statistics, analytical modeling, predictive analytics, and machine learning required by today's policy research communities.

Privacy and Security

- <u>Data Governance and Stewardship</u>. Security and privacy needs must be balanced with the utility of data. Completely closed datasets, while fully secure, offer limited value to society or taxpayers. Opening datasets for research can influence significant policy changes for social good but pose significant privacy risks. Therefore, it is imperative that formal data stewardship is encouraged amongst data providers (e.g., government agencies), data

intermediaries/custodians (e.g., U.S. Census Bureau), and data consumers (e.g., policy researchers). Formal data-sharing agreements, the definition of appropriate use, and records management/retention policy should be clearly defined. Data sharing should clearly articulate legal authority, permitted uses, and data access. Any new sharing or access arrangement should be accurately described in a System of Records Notice (SORN) and Privacy Impact Assessment (PIA), as appropriate, and all access to datasets should be automated to rely on policy and controls.

- <u>Security and Contextual Controls</u>. Best-in-class security that protects data in flight and data at rest is a pre-requisite to managing such a data infrastructure. Since researchers use data very differently, privacy-related controls have to address these needs differently. Aggregated and macro-datasets can be "Open" and free for download as is already happening with Open Data, while becoming relatively "Closed" with the increasing granularity of micro-datasets. Finally, the latest advancements in the fields of cybersecurity and applied cryptography should be leveraged to provide open but secure access to data.

- <u>Training and Audit</u>. Qualified researchers and institutions must be trained in both the appropriate policies surrounding the use of data, as well as any technology use and restrictions. Access to and use of such data should be audited periodically. Analytics and reporting mechanisms should be deployed to detect anomalies and undertake corrective actions.

Commission on Evidence-Based Policymaking—Public Hearing
Friday, October 21, 2016

Comments submitted by:
Amanda Janice Roberson, Research Analyst
Institute for Higher Education Policy

Abstract: The current postsecondary data infrastructure is fragmented and incapable of answering a number of important questions about how our students fare in the higher education system. Key stakeholders, including policymakers, institutions, researchers, and the students themselves, need better information about college access, progression, completion, and post-college outcomes. Given the federal government's substantial investment in postsecondary education, it is imperative that existing data – at the institutional, state, and federal levels – are leveraged to answer these critical questions. By fostering these data linkages and removing existing legal barriers, the Commission can create a system where data drive efforts to increase postsecondary success and close equity gaps.

Oral and Written Statement: Chairman Abraham, Co-Chair Haskins, and commissioners: thank you for the opportunity to address the Commission on Evidence-Based Policymaking on the importance of a cohesive postsecondary data infrastructure and its impact on evidence-based policymaking.

My name is Amanda Janice Roberson and I am a research analyst with the Institute for Higher Education Policy. IHEP is a nonpartisan, nonprofit organization committed to promoting access to and success in higher education for all students, with a focus on students who have been underserved by our postsecondary system. Based here in Washington, D.C., we believe that all people, regardless of background or circumstance, have the opportunity to reach their full potential by participating and succeeding in higher education.

In support of this goal, IHEP leads the Postsecondary Data Collaborative (PostsecData), a partnership between more than 35 organizations committed to the responsible use of high-quality postsecondary data to improve student outcomes. PostsecData partners represent a broad range of constituents, including groups that represent students, postsecondary institutions, the workforce community, and state and federal policy influencers and researchers.

Since 2014, IHEP has spearheaded research on which data should be collected, how metrics should be defined, and through which mechanisms our currently disconnected, duplicative, and incomplete data systems can work together to create a cohesive postsecondary data ecosystem. IHEP supports the mission of this Commission to analyze and make recommendations for streamlining federal data and data systems. We suggest the following actions to improve the landscape of postsecondary data for use by policymakers, students and families, institutions, and researchers.

- **Promote best practices in privacy and security for interconnected data systems.** Recommendations by the Commission for data linkages should address the importance of privacy, security, and confidentiality. As institutional practices and changing laws at the state level have led to confusion around when it is permissible to share or link data, policies and procedures from the Commission should be transparent, consult with data security experts to implement field-recognized best practices, and ensure that all publicly reported, aggregate data are stripped of personally identifiable information.

- **Leverage existing data to decrease burden, streamline reporting, and answer critical questions.** Data from sources like the U.S. Department of Education (which houses the National Student Loan Data System [NSLDS] and Integrated Postsecondary Education Data System [IPEDS]), Social Security Administration (SSA), the Department of Defense (DoD) and Department of Veterans Affairs (VA), among others, should be linked and leveraged to create a more complete picture of the higher education landscape. These sources provide valuable data on important subgroups of students who are often overlooked, including Pell grant recipients, student loan borrowers, and student veterans. If linked, these data would produce valuable information about enrollment and completion rates, and post-college employment and earnings. The Commission should consider ways to increase capacity and funding available to streamline processes and link data, as these are the primary challenges for state and local level data linkages.

- **Expand access to wage and labor market information for postsecondary outcomes.** In an era of scarce resources, the value of a postsecondary degree has never been greater, and post-college outcomes are increasingly important to policymakers and students. Now, data and metrics on employment and earnings are limited to voluntary initiatives, like College Measures, state dashboards, and the College Scorecard, revamped in September 2015. The Commission should explore datasets, like the Census Bureau's Longitudinal Employer Household Dynamics (LEHD) program or the National Directory of New Hires (NDNH), which both utilize state Unemployment Insurance (UI) wage records, or the Social Security Administration and Internal Revenue Service tax records, to understand the return on personal investment of students and families and federal investment in higher education.

- **Align definitions and metrics across federal laws.** Establishing common definitions for data metrics across federal laws like the Higher Education Act, the Workforce Innovation and Opportunity Act, and the Perkins Career and Technical Education Act could reduce administrative burden and create comparable outcomes across federal programs. Common and consistent metric definitions in the postsecondary ecosystem would make it much easier to link data between local, state, and federal sources and allow for accurate comparisons.

- **Recommend that Congress overturn the ban on a federal student-level data system.** The statutory ban on a federal student unit record system stifles the ability of policymakers to answer questions about our postsecondary system, limits the information available to consumers, and imposes unnecessary burden onto institutions. The Commission should recommend to overturn the ban and direct the U.S. Department of Education to engage with the higher education community to design and implement a student-level data system. This system would create a nationwide, inclusive data set that shows how students move through higher education and their post-college outcomes. This system would allow for disaggregation by key student characteristics, like Pell Grant receipt, race/ethnicity, and others, and illuminate evidence for future policymaking around closing equity gaps and the federal investment in higher education and postsecondary programming. Given the sensitive nature of record level data, the Commission should also recommend rigorous data privacy and security policies to govern this system.

Thank you for your time and the opportunity to provide a statement to the Commission. I look forward to answering any questions.

Commission for Evidence-Based Policymaking Public Hearing: Remarks from the American Statistical Association's Scientific and Public Affairs Advisory Committee

October 21, 2016

My name is Clyde Tucker and I am a member and former chair of the American Statistical Association's Scientific and Public Affairs Advisory Committee. The American Statistical Association was founded in 1839 and is the oldest continuously operating scientific society in the United States. With more than 19,000 members working in academia, government, and industry, the ASA works to promote the practice and profession of statistics, the science of learning from data, and measuring, understanding, and communicating its uncertainty. We believe that statistics and the ability to interpret statistical evidence are integral to the success of evidence-based policy making.

The ASA lauds Speaker Ryan and Senator Murray for their actions and efforts to bring evidence-based policymaking into the limelight. The ASA heartily supports the Commission for Evidence-Based Policymaking and looks forward to the Commission's efforts to improve the science surrounding evidence-based policymaking. We appreciate that three Commissioners are members of the ASA, two of which are former heads of federal statistical agencies. In my brief comments today, I will focus on five issues: (i) the stature and autonomy of the federal statistical system; (ii) data sharing that leads to data synchronization; (iii) concerns related to privacy and confidentiality that may present barriers to the release of data needed for evidence-based policy making; (iv) nurturing evidence-based policymaking capacity across the federal government; and (v) statistical evidence.

To ensure that the statistical analysis used to support evidence-based policy making is both impartial and accurate, the integrity of the research process must be maintained. In particular, the ASA believes that the federal statistical agencies will play a vital role in evidence-based policymaking, and ASA is committed to supporting the historical autonomy of these agencies in order to ensure the integrity of their work. In a 2015 letter to Congress, twenty former statistical agency heads wrote,

> As the foundation for policy making and policy administration, objective and credible statistical data are vital to our democracy, economy, governance, and well-being. All sides of a policy debate should be able to look to the statistical data as objective and high quality. Any perception that the data have been influenced by a partisan perspective undermines the policy making and its administration. The independence of a federal statistical agency is a critical element in an agency producing objective and credible statistical data… Statistical agencies should have complete control over data collection, analysis, and publication. Such autonomy

should include control over an agency's planning, budget, press releases, and information technology.

In the past, this independence for some agencies has been protected from direct political interference by requiring that the heads of statistical agencies be appointed by the President and confirmed by the Senate. Currently, however, Senate confirmation is no longer required to appoint the director of the Bureau of Justice Statistics or the commissioner of the National Center for Education Statistics (NCES). There is also a House-passed bill pending in the Senate that would remove presidential appointment of the NCES Commissioner.

The ASA also supports data linkage and collaboration between the federal statistical agencies. Indeed, greater information sharing across agencies would enhance the research supporting evidence-based policymaking. One example of this type of data sharing is data synchronization. For example, ASA advocates, as a follow up to the Confidential Information Protection and Statistical Efficiency Act (CIPSEA), providing the Bureau of Labor Statistics and the Bureau of Economic Analysis the same access to the Internal Revenue Service's business information that the Census Bureau currently has. Supported not just by ASA but also by a wide variety of other stakeholders, this carefully crafted proposal costs no money, but would result in substantial improvements to the quality of our nation's official economic statistical data, ultimately benefitting policymakers, US businesses, and many other Americans. For more information on this, I provide links to three resources at the end of my written comments that I understand you will have access to.

Although privacy and confidentiality are important concerns with respect to the release of data for research purposes, barriers created to ensure privacy and confidentiality could limit analysis critical for evidence-based policymaking. In particular, researcher's access to data often is delayed as a result of the need to undergo reviews by multiple Institutional Review Boards (IRBs). This process can impede the ability to respond quickly to the needs of policymakers. I have provided a link to a new National Academies report that notes the delays caused by the multiple IRB approvals sometimes needed for a single study and the serious problems this creates for timely policymaking.

While perhaps beyond the charge of this committee, ASA also encourages more resources for federal agencies to develop their internal capacities for evidence-based policymaking. Although the statistical agencies have statistical expertise needed for evidence-based policymaking, a number of agencies do not. More could be done to increase this analytical capacity across the government. Given the constrained budgets of the federal government, we understand adding personnel with appropriate expertise isn't widely feasible. However, we strongly encourage alternative solutions, such as guidance documents and professional development on this topic. In fact, staff at the statistical agencies might be involved in these endeavors. We would also support greater agency collaboration through reduced barriers and greater access to data for trusted and vetted users in ways that ensure confidentiality protection.

Let me close with comments on statistical evidence for the wider evidence-based policymaking community. We encourage the use of modern statistical and data science methods in program evaluations—methods such as Bayesian modeling, decision analysis, and big data techniques. To put our comments in context, we recently saw statistical language in pending legislation that seemed artificially restrictive. Specifically, we were concerned that the language might limit analysis to significance testing or p-values alone.

The ASA Scientific and Public Affairs Advisory Committee recently released a statement with guidance on statistical language in legislation, http://ww2.amstat.org/misc/SPAAC_GuidanceStatisticalEvidence.pdf. We look forward to continued conversation on this issue.

To reiterate, we fully support the Commission on Evidence-Based Policymaking and look forward to engaging the statistical community in your efforts. Thank you for your time.

General Comment

Dear Commission on Evidence-Based Policymaking,

I love the American concept of voter-based, Constitution-based, elected representative-based, policymaking. It's why I live in America. In contrast to voter-based policymaking there is evidence-based policymaking, which I don't love because it implies that one entity's "evidence" trumps individuals' consent to new policy changes.

Former Secretary of Agriculture Ezra Taft Benson said something about education that also applies to educational data and policymaking:

"The best way to prevent a political faction or any small group of people from capturing control of the nation's educational system is to keep it decentralized into small local units... This may not be as efficient as one giant super educational system (although bigness is not necessarily efficient, either) but it is far more safe. There are other factors, too, in favor of local and independent school systems. First, they are more responsive to the needs and wishes of the parents and the community. The door to the school superintendent's office is usually open to any parent [or teacher]... But the average citizen would be hard pressed to obtain more than a form

letter reply from the national Commissioner of Education in Washington, D.C."

Local control, and consent of the governed, are two foundational principles in our great nation.

Because the CEP is not an elected body, it does not hold authority to collect, or to recommend collection, of student-level evidence, or of any evidence, without written consent; and, for the same reasons, neither does the Department of Education.

Because the fifty, federally-designed, evidence-collecting, State Longitudinal Database Systems never received any consent from the governed in any state to collect data on individuals (as the systems were put into place not by authority, but by grant money) it follows that the idea of having CEP study the possible removal of barriers to federal access of those databases, is an egregious overstep that even exceeds the overstep of the State Longitudinal Database Systems.

Because federal FERPA regulations altered the original protective intent of FERPA, and removed the mandate that governments must get parental (or adult student) consent for any use of student level data, it seems that the idea of having CEP study and possible influence removal of additional "barriers" to federal use of data, is another egregious overstep.

As a licensed teacher in the State of Utah; as co-founder of Utahns Against Common Core (UACC); as a mother of children who currently attend public, private and home schools; as acting president of the Utah Chapter of United States Parents Involved in Education (USPIE); as a patriot who believes in "consent of the governed" and in the principles of the U.S. Constitution; and, as a current tenth grade English teacher, I feel that my letter represents the will of many who stand opposed to the study of the removal of protective barriers on student-level data, which the CEP's website has outlined it will do.

I urge this commission to use its power to strengthen local control of data, meaning parental and teacher stewardship over student data, instead of aiming to broaden the numbers of people with access to personally identifiable student information to include government agencies and/or educational sales/research corporations such as Pearson, Microsoft, or the American Institutes for Research.

To remove barriers to federal access of student-level data only makes sense to a socialist who agrees with the Marc Tucker/Hillary Clinton 1998 vision of a cradle-to-grave nanny state with "large scale data management systems" that dismiss privacy as a relic in subservience to modern government. It does not make sense to those who cherish local control.

It is clear that there is a strong debate about local control and about consent of the governed, concerning data and concerning education in general. NCEE Chair Mark Tucker articulated one side of the debate when he said: "the United States will have to largely abandon the beloved emblem of American education: local control. If the goal is to greatly increase the capacity and authority of the state education agencies, much of the new authority will have to come at the expense of local control."

Does that statement match the philosophical stand of this commission? I hope not. Local control means individual control of one's own life. How would an individual control his or her own destiny if "large scale data management systems" in a cradle-to-grave system, like the one that Tucker and Clinton envisioned, override the right to personal privacy and local control? It is not possible.

I urge this commission to use any influence that it has to promote safekeeping of unit-record data at the parental and teacher level, where that authority rightly belongs.

Sincerely,

Christel Swasey

United States Parents Involved in Education (USPIE) is a nonprofit, nonpartisan, nationwide coalition of state leaders focused on restoring local control of education by eradicating federal intrusion. State leaders from around the country fed up with being ignored on education policy have joined forces to abolish the US Education Department and put an end to all federal education mandates.

USPIE endeavors to inform Americans of the trillions of dollars wasted on federal education in the last 35 years with nothing to show for it but stagnant, and declining test scores. It is the goal of USPIE to return American's education to its proper local roots and restore parental authority over their children's education.

USPIE's STOP FED ED campaign is led by parents, taxpayers and educators committed to ending the U.S. Department of Education. The fight against Common Core has exposed the failures of those trying to force a federally-based one size fits all curriculum on states and local school districts.

So we ask, "why even have a federal department?" Because it's not about children. It's about control. Control through federal dollars. And it's big business. It's about pushing an agenda. And it's about ending something that had worked for years and replacing it with something no one even understands.

For half a century now this experiment with federal control of local public schools has gone on and it's failed. Let's stop treating our children like rats in some social engineering laboratory and start treating children like children again. The first step is ending the Department of Education and that's what STOP FED ED is all about.

From Data to Action:
Achieving Results People Care About Most

PRESENTATION TO THE

COMMISSION ON EVIDENCE-BASED POLICYMAKING

QUENTIN WILSON

WASHINGTON, DC

OCTOBER 21, 2016

Breaking Good

The effective use of good data is vital to achieving the results about which people care most.

The CEP environment includes a global consensus, bi-partisan support, high ambitions, new resources and recent successes in the use of data, analysis and evidence to improve public program performance.

The Commission agenda on data access and protection can help broaden and deepen the use of data and analysis for that purpose.

The value of this agenda can be increased and sustained to simultaneously take two big steps:

- Providing information and other resources to help speed the improvement process; and
- Linking programs performance to the high-level results about which people care most.

Global Consensus and Advancement: Using Data to Achieve Better Results

The Need to Share and Link Federal Data on the Post-9/11 GI Bill

We urge the Evidence Based Policymaking Commission to take steps to end the siloization of federal data and ensure that federal agencies share data.

The Post-9/11 GI Bill provides an important example of the detrimental impact of siloed federal data.

Why it Matters:
Historians and economists frequently credit the original GI Bill with helping to build America's Middle Class following WWII. After the 9/11 terror attacks on American soil, a new GI Bill was enacted to provide the current generation of veterans with their ticket to the American dream, helping 1.5 million veterans at a cost to taxpayers of $61 billion since August of 2009. The goal is to assist veterans in the transition to a successful civilian career.

In order to best serve veterans and the federal taxpayer investment, government officials, higher education leaders, and policymakers need to know how the GI Bill is succeeding and "what works" under the GI Bill.

Such an assessment is impossible because federal data regarding student outcomes and occupational outcomes for veterans remain siloed across several federal agencies.

At this time, nobody in America knows the student veteran graduation rate, debt rate, default rate, or whether the Post-9/11 GI Bill is succeeding in supporting veterans' transition to civilian occupational and income success. Little is known about veterans' educational attainment, debt or default, because the U.S. Education Department (ED) does not know which students are veterans and the U.S. Department of Veterans Affairs (VA) does not track student outcomes. Although ED formerly tracked veterans in its database, it stopped doing so in 2009, when it introduced a skip-pattern in its FAFSA form, such that most veterans never seeing the question about military service. Unfortunately, this change at ED was launched the exact same year (2009) that the Post-9/11 GI Bill went into effect. A 2014 U.S. Senate Committee reported that for-profit colleges dominate the Post-9/11 GI Bill and generally provide poor outcomes for students overall, while costing taxpayers twice as much per veteran as public colleges and universities, but student outcomes specific to veterans was unknown. Indeed, reporters asked the Senate Committee what the student veteran graduation rate was, and this question was

impossible to answer because the data needed to answer this basic question is held in separate agencies.[1]

In addition, occupation and income data from IRS and Census is not linked to either VA or ED data.

What Data-Linking or Sharing Could Achieve:
If data from VA and ED were shared or cross-walked and if occupational and income data from IRS or Census were added, the resulting combined data set would provide solid answers on the student veteran graduation rate, debt and default rates, job placement rate, and income. The shared data would:

Help veterans make an informed college choice as they decide where to use their GI Bill by arming them with data about veterans' probability of graduation and likely earnings trajectory from each college (and each program). VA's GI Bill College Comparison Tool is currently the best source of information for veterans choosing a college, but it does not provide veteran-specific data. If federal data were shared, VA's GI Bill College Comparison Tool could be as robust as ED's College Scorecard. The College Scorecard was possible only because federal agencies shared data. The College Scorecard provides students with important data-points about student graduation (specifically, the graduation rate within 150% of expected time to completion for first-time, full-time students) and salary after attending (specifically, the median earnings of former students who received federal financial aid 10 years after entering the school). It should be noted that much of ED's data is limited to first-time, full-time students, which is an outdated limitation and one the Commission should urge ED to change.

Help Congress and policymakers improve regulation by providing data on Post-9/11 GI Bill students and their debt and occupational rates. Currently, Congress and policymakers have no data on the student outcomes, nor on the occupational and income outcomes, of educational paths under the Post-9/11 GI Bill. Understanding a return on investment would assist

---

[1] Private efforts have tried to determine the student veteran graduation rate, but it is impossible without VA and ED actually sharing data. The largest private effort (by Student Veterans of America, known as the 2014 "Million Records Project" and its 2016 update "NVEST") undertook to match VA data on Post-9/11 GI Bill use against data from the National Student Clearinghouse to try to determine the student veteran graduation rate for a subset of GI Bill users. But the Clearinghouse data is limited to degree-granting schools (and covers most, but not all veterans at degree-granting schools), so it provides only a limited answer. Most notably, Clearinghouse does not track students at certificate, non-degree programs, nor vocational/technical programs (both of which are covered under the GI Bill). VA estimates that nearly half of the GI Bill is spent at non-degree schools, meaning that the Clearinghouse data and the "Million Records Project" are missing half of GI Bill students. Specifically, VA reports that among Post-9/11 GI Bill students starting their education in 2015: some 54,000 Post-9/11 GI Bill students were starting non-degree college programs, and 30,000 started vocational and technical programs, while 87,275 started undergraduate degree programs and 19,222 started graduate degree programs.

policymakers greatly, but requires federal data matches. Data-linkage would enable exploration of the effectiveness of the Post-9/11 GI Bill in ensuring a successful civilian career for the current generation of veterans. Adding in data from the U.S. Defense Department's test scores on service members' abilities and skills could serve as "controls" in determining the impact of the GI Bill.

Executive Order 13607 (April 27, 2012) required VA and ED to share data to determine veteran student outcome measures, but, four and a half years later, the agencies still have not completed an MOU to do so.

Detailed Questions That Could Be Answered if Federal Data Were Combined:

1. **Participation in the Post-9/11 GI Bill**:

    a. **Nearly half of the Post-9/11 GI Bill goes unclaimed**. What are the demographics of veterans who skip the GI Bill? How are they faring? What are their occupations and incomes, and how do those compare to their occupations and incomes prior to military service? Are they reliant on public assistance? Did they skip the GI Bill because they already had a college degree, or because they had a strong career before military service? By historic contrast, only 20% of eligible veterans skipped the original GI Bill following WWII, and such eligible non-participants were often older (over the age of 35).[2] In terms of occupation prior to military service, most veterans who utilized the original GI Bill after WWII had "little or no pre-war experience in jobs requiring extensive skill or training," while those who skipped it (eligible non-participants) had been "working in jobs of a fairly high level" before the war.[3] Are these trends true today under the Post-9/11 GI Bill? Veterans organizations report anecdotal evidence that many veterans skipping today's GI Bill do need higher education but feel intimidated by the college search process and fear their academic skills are not up to par.

---

[2] The President's Commission on Veterans' Pensions, *Veterans Benefits in the United States* (April 1954), Omar Bradley, Chairman (known popularly as the "Bradley Commission"), *available at* http://www.cnas.org/sites/default/files/Bradley_Commission_Report1956.pdf (page 251, 259). The Bradley Commission found that 83-86% of veterans in the two youngest groups (under 20 or between 20-24 years of age) used the GI Bill.

[3] Bradley Commission, *available at* http://www.cnas.org/sites/default/files/Bradley_Commission_Report1956.pdf (page 261). The Bradley Commission also reported that that many of the younger veterans "had held no regular job before entering service. In general, those who had held jobs were in relatively unskilled occupations." (page 258). In contrast, only 30% of pre-war managers and proprietors used the original GI Bill, as did only 39% of pre-war full-time employees. (page 261)

b. **Participation under the Post-9/11 GI Bill is increasing each year**. VA data shows that nearly 1 million eligible individuals participated in 2011, a 15% increase over FY 2010 and a 71% increase over FY 2009. Do the data show better student outcomes (such as persistence and completion) and civilian employment success among more recent GI Bill students as compared to 2009 and 2010? Are student loan debt and default levels rising? Has the return on taxpayer investment changed over time?

c. **Non-Veteran vs. Veteran Participants**. Veterans can choose to give some or all of their Post-9/11 GI Bill to their spouse or dependents, and 18% of GI Bill students are spouses or dependents. Do non-veteran GI Bill students enjoy better outcomes than veterans? Do they have better persistence and completion rates in college, perhaps indicating that veteran students need more support on campus? How do non-veteran Post-9/11 GI Bill students' loan debt and default rates compare to their veteran counterparts? Do non-veteran participants have higher incomes and better correlation between their occupation and field of degree?

d. **Outcomes by Demographics**. Are there differences by age, race, gender, ethnicity, or residential region in outcomes for Post-9/11 GI Bill users? For example, some VA analyses suggest that women veterans are more likely to use the Post-9/11 GI Bill than men. Is their persistence better? Are their outcomes better?

2. **GI Bill Effectiveness**. How effective is the Post-9/11 GI Bill in ensuring a successful civilian career for the current generation of veterans?

a. **Income & Public Assistance**. Do veterans have higher incomes and less dependence on public assistance programs after using the Post-9/11 GI Bill than before they used it? By point of comparison, the original GI Bill, following WWII, reportedly reduced reliance on unemployment assistance from 20% of veterans.[4] What is known about veterans who rely on public assistance programs? How many have a college degree, whether through the Post-9/11 GI Bill or otherwise? What was their field of study in college? What is their occupation?

b. **Degree and Occupation**. Do veterans have different occupations after using the Post-9/11 GI Bill than before they used it? Among Post-9/11 GI Bill users, which occupations, degrees, and fields of study result in the highest income and least reliance on public assistance? Do the degrees and occupations correlate, or is occupational success (at least in some occupations) independent of degree

---

[4] Bradley Commission, *available at* http://www.cnas.org/sites/default/files/Bradley_Commission_Report1956.pdf (pate 251).

obtained? What about licensed occupations? Does the GI Bill help veterans obtain work in licensed occupations? (Approximately 20% of a sample of 300 degree programs approved by VA for Post-9/11 GI Bill in licensed occupations are improperly accredited and fail to leave the graduates eligible to work.[5] What percent of veterans working in licensed occupations used the Post-9/11 GI Bill in that field of study? Are public colleges more likely to have the right accreditation for graduates to be eligible to work in licensed fields?) Which degrees and institution types produce graduates employed in which fields, with which licenses?

c. **Debt and Default**: What are the student loan debt and default rates for both veteran and non-veteran beneficiaries using the Post-9/11 GI Bill? Are debt and default rates higher for veterans than non-veteran students using the Post-9/11 GI Bill? Are there correlations in student loan debt and default by degree and field of study obtained? By college type (online vs. brick and mortar) and institutional sector? By occupation and income?

d. **Montgomery GI Bill vs. Post-9/11 GI Bill**: Does the Post-9/11 GI Bill deliver better return on investment, including student and occupational outcomes, than its immediate predecessor, the Montgomery GI Bill?

3. **Which College Experience Yields the Best Return on Investment under the Post-9/11 GI Bill?**

a. **Brick and Mortar vs. Online**. Among Post-9/11 GI Bill users, what type of college is most effective? Many experts assume brick and mortar colleges are more effective than online education, but online education is very popular with military students. What are the educational outcomes and civilian employment success for online student veterans?

b. **Institutional Sector**. Among Post-9/11 GI Bill users, which sector of college is associated with the best student outcomes and civilian employment success: public, non-profit, or for-profit? What is the return on investment from each sector?

---

[5] See Veterans Education Success, "The GI Bill Pays for Degrees That Do Not Lead to a Job," (Sept. 2015) *available at* http://static1.squarespace.com/static/556718b2e4b02e470eb1b186/t/56ba65f8356fb040f04fb56a/1455056377419/GI+Bill+Dollars+do+not+pay+for+accredited+programs.pdf

i. Several government[6] and private reports[7] have concluded that **for-profit colleges** do not serve students well. Do for-profit colleges have lower persistence and completion rates among Post-9/11 GI Bill students than other sectors? Do for-profit colleges produce higher student loan debt levels and default rates? What are the civilian employment results for Post-9/11 GI Bill graduates? Also, what is the return on investment?

ii. Experts often claim **public community colleges** produce better results for veterans, and significant public and private funds are invested in community college programs for veterans. What are the student outcomes and civilian employment success of veterans at community colleges compared to other sectors? What is the return on investment for veterans at community colleges?

c. **Specific Colleges**: Because much of the Post-9/11 GI Bill expenditures are concentrated in a handful of colleges, it is possible to derive robust samples at those colleges, enabling an assessment of how well the colleges are serving veterans and the taxpayer investment.

d. **Type of Degree**: Are there differences in the return on investment among GI Bill students attending college degree programs (e.g., Bachelor of Science in Engineering) vs. non-degree, certificate programs (e.g., Certificate in Radiology Technology) vs. vocational/technical programs (e.g., truck driving) – taking into account the cost of the program and the resulting civilian success? (Defense Department scores of service members' skills and abilities could serve as a control when measuring post-education occupational success.) Do demographic or household income correlate with type of degree chosen?

e. **Field of Study**: Is it possible to determine program-specific outcomes, such as the return on investment of a B.S. in Engineering vs. a B.S. in Nursing, factoring in demographic and pre-education differences?

We hope the Evidence Based Policymaking Commission can take strong steps to end the siloization of federal data and ensure that federal agencies share data to benefit the public as well as policymakers.

H1_2016_07
October 21, 2016 Hearing
Workforce Data Quality Campaign
Presenter: Rachel Zinn

Critical Issues for the Commission on Evidence-Based Policymaking

Statement from Workforce Data Quality Campaign

The Commission on Evidence-Based Policymaking's examination of federal administrative and survey data provides an exceptional opportunity to address the management and use of data for measuring postsecondary education and workforce outcomes. The Commission's findings and impact could lead to more inclusive, aligned and market-relevant data systems to help educators, students, employers, workers and policymakers all make more informed decisions.

Workforce Data Quality Campaign (WDQC) is a non-profit initiative that promotes inclusive, aligned, and market-relevant education and workforce data. We engage hundreds of national experts, state officials, and workforce development advocates, encouraging the use of data to ensure that all of our nation's education and training programs are preparing students and workers to succeed in a changing economy. Given our mission, we are excited about the promise of the Commission's work, and are pleased to have the opportunity to share our recommendations.

Data collected and held by the government could help to answer a range of important postsecondary education and workforce questions, such as:

- Which skilled positions are employers having a difficult time filling, and what institutions might they look to for recruitment?
- Are recent college graduates finding jobs and earning good wages?
- How much do students borrow, and can they repay these loans?
- What types of education and training pathways are helping people succeed in careers?
- Which program models are most effective at helping target populations (e.g. ex-offenders, veterans, low-income individuals) gain skills and find stable employment?
- How can workers know which short-term credentials would likely raise their earning potential?
- What job search strategies are most effective, and for whom?

In some instances, surveys have been able to answer those questions over a limited time frame, but with great effort and expense. A growing number of state longitudinal data systems are linking administrative records to answer questions. However, geographical coverage is limited, so they cannot answer questions about students who leave the state, or compare outcomes across states. The federal government already collects data through numerous administrative sources, in addition to conducting regular surveys. With improved coordination, these data could be systematically shared and linked to answer those and other critical questions for generations to come.

Issues for Action

Strides have been made in recent years, but much information remains separated between agencies because of technological, cultural, and legal barriers. WDQC encourages the Commission to recommend the following actions in its final report:

1.) **Expand access to wage information**

The Commission should examine how the federal government can build on existing data collections and facilitate the linking of employment and earnings data across higher education and training programs.

Students and workers want to know which education and training programs will help improve their chances of having successful careers. Researchers need access to more detailed and comparable data on programs to analyze which pathways are working for students and workers. Agencies at all levels of government want to know the short- and long-term employment outcomes of those they have served.

Potential relevant data sources include the National Directory of New Hires and the Census Bureau, which contain Unemployment Insurance wage records submitted by states. The Internal Revenue Service and the Social Security Administration have individual tax records. In limited instances, agencies have found ways to use these data to show employment outcomes for programs, but the federal government needs to create efficient, strategic processes for managing employment data. The Commission should consider how a federal clearinghouse could streamline employment data collections and rationalize processes for access, while protecting privacy and enhancing security.

2.) **Improve information on postsecondary progress and outcomes**

The Commission should examine ways — such as establishing a federal student record system — to measure postsecondary student progress and more effectively and efficiently answer important consumer and policy research questions.

Stakeholders do not have access to comparable information at the program level, and in many cases, only students receiving financial aid; attending first-time, full-time; or those pursuing two or four year degrees are counted. These limitations exclude non-degree credentials that are growing in number and importance, as well as the transfer, part-time, and adult students who now outnumber "traditional" postsecondary students. The Department of Education's College Scorecard and planned changes in the Integrated Postsecondary Education Data System (IPEDS) reflect progress toward providing and linking data for analysis and consumer-friendly interfaces, but the information remains scattered and incomplete. Overturning legal prohibitions on federal collection of data on individuals involved in postsecondary education and training programs, and implementing a national student record system, would allow for building a more complete picture with lower administrative burden.

3.) **Provide more accessible labor market information**

The Commission should include in its examination how labor market information (LMI) might be better integrated to provide more comprehensive and clear information.

Having access to LMI (e.g. occupational projections) may strengthen a worker's ability to make decisions about employment and training, and help to improve the alignment of education and training programs with labor market demand. The Bureau of Labor Statistics, Census, and other statistical agencies could more effectively collaborate and incorporate additional information from federal programs to enhance data about employment, worker characteristics, and the job market. If the Commission examines LMI, it should coordinate with the newly established Workforce Information Advisory Council (WIAC), which reports to the Secretary of Labor.

4.) **Harmonize definitions and metrics across federal laws**

The Commission should explore how the federal government could implement similar definitions and metrics to streamline reporting and improve opportunities for data linkages between programs.

State agencies and service providers often face the burden of having to report on program results using different definitions and measures, which increases staff time and cost. Using common definitions and metrics from the Workforce Innovation and Opportunity Act (WIOA) for other programs as appropriate, such as those operating under the Perkins Career and Technical Education Act, would reduce administrative burden, make outcomes more comparable, and facilitate coordination across human capital programs.

5.) **Clarify privacy and security protections**

The Commission should account for best practices in privacy and security as it conducts its review.

Institutional practices and changing laws at various levels of government have often created confusion around what is possible and led to blockages in sharing and linking data, even when doing so is legal. Policies and procedures recommended by the Commission should be transparent, utilize evolving best practices for data security, and ensure that publicly available data are aggregated or otherwise stripped of all information that could be used to identify particular individuals or employers. As noted by presenters in an earlier Commission meeting on privacy and security issues, the Commission should respect varying viewpoints on privacy rights. In order to strike an appropriate balance between privacy concerns and optimal use of data to improve publically-funded programs, the Commission should ensure that federal policy accounts for emerging technologies that can help protect sensitive information.

As the Commission conducts its examination, we encourage the elevation and promotion of high-quality data sources that can be used to inform human capital development policy. We hope the Commission will focus on maximizing the use of data to enhance decision-making and continually improve education and training services that allow all Americans to contribute to a 21st Century economy.

Chicago Public Input–Hearing Testimony

December 18, 2016

Rhode Island Innovative Policy Lab (RIIPL)
Brown University

Commission on Evidence-Based Policymaking Written-Statement:

On behalf of the Rhode Island Innovative Policy Lab (RIIPL), we are pleased to provide stakeholder input on the Commission on Evidenced-Based Policymaking.

The Rhode Island Innovative Policy Lab (RIIPL) at Brown University is a new collaboration between researchers at Brown University and the Office of the Governor in Rhode Island. It is a prototype innovative policy lab, centered around synergetic partnerships with State and Federal government partners to develop new policies and measure their successes. Together, RIIPL and the Rhode Island Government are using data and rigorous research to support the development of more effective public policy. The goals are to increase equity of opportunity for all Rhode Islanders through more effective policy, and provide rigorous evidence on what works for policy makers throughout the country.

In this statement, we wish to voice support for the work of the Commission on Evidence-Based Policymaking (CEP) which is part of an important movement to create a new approach to policy-making. The commission is charged with making recommendations for how data and results of research can be used to evaluate and better design government programs. At present, there are thousands of policies at the federal, state and local levels, yet little is known about their effectiveness. Efforts like RIIPL's and the CEP's are important steps in measuring what works, and implementing it to improve lives through increased policy effectiveness.

Researchers at RIIPL combine data science, behavioral science, economics and public policy in our approach to creating evidence-based reforms. We foster collaboration between scientists and practitioners to come up with real, workable and testable solutions. RIIPL also integrates education at Brown University into the research and dissemination process to change the way policy is approached in the future by training the next generation of leaders as part of the collaborative research and policy innovation process. At RIIPL, communication and collaboration between policy makers and researchers facilitate research, discovery and learning which feed directly into actionable policy innovation - the goal of evidence-based policy.

Through research-government collaboration, we are discovering what works in five key areas:

- Closing the Achievement Gap by increasing equity of opportunity so that all children, regardless of background, have the ability to reach their potential.

Rhode Island Innovative Policy Lab at Brown University
Science Library - Level 10, 201 Thayer Street, Providence, RI 02912

Page 1 of 2

- Developing Smart Social Programs with higher impact per dollar so that we can fight poverty effectively.
- Restoring Community through improved criminal justice programs which recognize that society gains most when all people are productively engaged.
- Designing Regulation that Works for business and the environment by creating transparent regulations which protect the environment and grow the economy.
- Learning from the Past by using prior policy changes to inform future decisions because we can learn from our failures and successes alike.

Together, RIIPL and the Rhode Island Government are putting data and science to work to increase equity and opportunity in society, making Rhode Island an incubator for Smart Policy and a leader in data-driven policy innovation. We support national efforts such as the CEP's work to foster and support government-research relationships and research-driven policy.

Testimony as prepared for
Commission on Evidence-Based Policymaking
Midwest Public Hearing
5 January 2017

I am testifying today on behalf of Raise Your Hand and the Parent Coalition for Student Privacy.

Raise Your Hand is a Chicago-based grassroots parent group that advocates for high-quality public education for all students in Chicago and Illinois. We are a primarily volunteer-run organization. We formed in 2010 to work on the issue of inadequate and inequitable funding of Chicago Public Schools and have expanded to work on several other education policy areas, including student privacy.

The Parent Coalition for Student Privacy formed in 2014 and is a national coalition of parents and advocates defending the protection of student data privacy.

The Parent Coalition for Student Privacy wrote a letter in November to the Commission opposing the creation of a centralized, federal clearinghouse of the personally-identifiable information of all students, commonly referred to as a student unit-record system or national database. This letter was signed by five other groups as well, including the American Civil Liberties Union and the Network for Public Education.

The risk that a federal database of student unit records would pose to student privacy is immense; including the very real possibility of breach, malicious attack, or the use of this information for purposes not initially intended. In the years since a federal student unit-record system was banned by the Higher Education Act in 2008, the reasons against creating it have only become more compelling.

In the past few years, much highly personal data held by federal agencies has been hacked, including the release of the records of the Office of Personnel Management involving more than 22 million individuals, not only federal employees and contractors but also their families and friends.

The US Department of Education in particular has been found to have especially weak security standards in its collection and storage of student data, and received a grade of D on the government scorecard created to assess how well federal agencies were implementing data security measures this past May.

In addition, preK-12 student data currently collected by state departments of education that would potentially be shared with the federal government include upwards of 700 highly sensitive personal data elements, including students' immigration status, disabilities, disciplinary records, and homelessness data.

As privacy advocates in the UK recently discovered, the personal information in a similar national student database that the government promised would be used only for research purposes has been secretly

requested by the police and by the Home Office, in part to identify and locate undocumented children and their families.

We are also very concerned about recent revelations of the widespread surveillance on ordinary citizens by the federal government, and the way in which a national student data system would be used to expand the tracking of students from preschool into high school, college, the workforce and beyond. A federal data clearinghouse of student information could effectively create life-long dossiers on nearly every individual in the nation.

The rapid adoption of the use of digital technology in preschool through high school has been accompanied by a similarly rapid increase in the generation of data tied to individual students and collected and stored by third-party organizations. Dozens of software and hardware vendors have products in use in the Chicago Public Schools alone. The regulation and protection of the data generated by such programs remains an open question. As this data is almost always tied to a student's personally-identifiable information, it too could be connected to and at risk from a national student-record system.

There have been at least two major, known data breaches in Chicago Public Schools in the last two years. In May of 2015, 4000 students had their names, addresses, phone numbers, disability status and other personal information inadvertently shared with vendors responding to a district RFP.[1] This past fall, a CPS employee was fired for unauthorized sharing of personal information of more than 28,000 students with a charter management organization who then used the data for marketing.[2] Student data is already highly vulnerable even without a federal data clearinghouse.

In light of all these concerns, we urge you to strongly oppose the creation of *any* centralized federal data system holding students' personally identifiable information and to support the continuation of the ban in the report you provide to Congress.

Although I am now a full-time advocate for public education, my professional training was as a research scientist in a quantitative field, computational linguistics. As a scientist, I certainly agree that high-quality data collection is a crucial ingredient in the research process. I also know that the ethical considerations in research using data from human subjects are paramount and that well-supported conclusions can be drawn from statistical samples derived from carefully designed experiments.

We do *not* need to track every student from preschool to the workforce in order to create an efficient and successful public education system, and given the risks and costs of doing so, we should not do it.

---

If we want evidence-based policy for education, we need to put the burden on experimental design, not on our children's private data. Researchers must devise ways to test hypotheses that require the least amount possible of individuals' private data—just as we minimize the risk for physical or mental harm in clinical trials—because universal, lifelong data collection is an unacceptably unethical course of action.

I urge this Commission to consider the principles in the Belmont Report, written more than 40 years ago under the charge of an earlier federal commission, the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research: the principles of respect of persons, beneficence and justice. The creation of a national database of student records violates all three of those principles.

Once privacy is lost it is nearly impossible to restore. And so, we hold a moral and ethical obligation to our children – and our citizens -- to minimize such a risk in any way possible.

TESTIMONY

Donna K. Ginther
Professor, Department of Economics
Director, Center for Science, Technology & Economic Policy
University of Kansas
and
Research Associate
National Bureau of Economic Research

Before the
Commission on Evidence-Based Policy Making—Public Hearing

January 5, 2017

Introduction

Chair Abraham, Chair Haskins, and distinguished members of the Commission, thank you for the opportunity to testify before the Commission on Evidence-Based Policy. My testimony will address the goals of the commission through the lens of my personal experience as an evidence-based policy researcher.

I have the following observations for the committee: <u>First, evidence-based policy is critically important for the efficient allocation of government resources.</u> The Commission's report, *Using Administrative and Survey Data to Build Evidence*, provides several examples of how administrative and survey data have informed policy. I highlight some of my contributions to policy in this testimony.

<u>Second, evidence-based policy is easier said than done. In my experience, evidence-based policy only takes place when policy-makers initiate the process.</u> When researchers approach

government agencies with a request to use administrative or survey data in ways that stray from the norm, the barriers to using these data become insurmountable.

Third, to the extent that states gain more control over administering federal programs (for example Temporary Assistance to Needy Families), obtaining permission to use state data and the complexity of state policies will raise additional barriers to evidence-based policy. State governments do not typically have the resources or expertise to maintain high-quality data. Some states, such as Wisconsin, have worked closely with researchers to understand policy. The Institute for Research on Poverty at the University of Wisconsin-Madison has had access to state child support data for years, and assisted the state with improving child support payments. The Texas Schools project, based at the University of Texas-Dallas has longitudinal student data and is a model for providing access to researchers. North Carolina, Florida and Michigan have also shared student data with researchers. However, these states are the exception in granting access to researchers.

Finally, I have two recommendations for the Commission: First, the Commission must think carefully about the incentives for policy makers to support evidence-based policy. Second, I recommend that a series of experiments be conducted with federal agencies to incorporate evaluation of current programs and research design in new programs in order to evaluate their effectiveness. I am not convinced that every program requires a randomized controlled trial before implementation. However, quasi-experimental designs, field experiments, and good "old fashioned" data analysis with administrative data can go a long way towards informing policy. Once the "proof of concept" has been established and refined, then evidence-based policy could be more widely implemented across the government.

2

In the testimony that follows, I will provide a brief overview of my work related to evidence-based policy, describe my experience with the barriers to using administrative and survey data, discuss successful examples of evidence-based policy, and provide recommendations to the Commission on policy-maker incentives and research design in program evaluation.

Research Related to Evidence-based Policy

I am a proponent of the concept of "Big Data to Knowledge,"[1] and my research and the work of the Center for Science, Technology & Economic Policy is united by our approach of linking several data sources together to create big/complex data that yield insights that are greater than the sum of its parts. I have received several federal and foundation grants for work in the interdisciplinary field of the Science of Science and Innovation Policy (SciSIP). At the core of Science Policy research are two related economics questions: 1) How should the federal government allocate scarce research and development resources to maximize economic growth and development? 2) What is the return on the federal government's research and development investments? My research contributes to the study of science policy by examining the allocation of grant funding, gender and race/ethnicity differences in academic careers, and scientific entrepreneurship and innovation. I was also the principal investigator on the NSF grant to fund

---

[1] Big Data to Knowledge (BD2K)—an initiative started by the National Institutes of Health in 2012 that is related to some of the goals of the Commission on Evidence-Based Policy. According to the NIH: "The BD2K initiative addresses four major aims that, in combination, are meant to enhance the utility of biomedical Big Data: 1) To facilitate broad use of biomedical digital assets by making them Findable, Accessible, Interoperable, and Reusable (FAIR); 2) To conduct research and develop the methods, software, and tools needed to analyze biomedical Big Data. 3) To enhance training in the development and use of methods and tools necessary for biomedical Big Data science. 3) To support a data ecosystem that accelerates discovery as part of a digital enterprise." https://datascience.nih.gov/bd2k/about.

the Kansas City Research Data Center,[2] one of the twenty-four Federal Statistical Research Data

Centers.

Under my direction, the Center for Science, Technology & Economic Policy (CSTEP) at

the Institute for Policy & Social Research at the University of Kansas has undertaken several

"big data" projects. Between 2010 and 2015, CSTEP was the administrative home of the

Kansas City Area Education Research Consortium (KC-AERC), an education research

consortium modeled on the University of Chicago Consortium of School Research. Unlike the

Chicago Consortium that has researchers from one university working with one school district,

KC-AERC consists of a multidisciplinary team of researchers from the University of Kansas, the

University of Missouri-Columbia, the University of Missouri-Kansas City, and Kansas State

University who work with the 32 Kansas City-area school districts in both Kansas and Missouri

to conduct data-driven education policy research and evaluation. CSTEP has also received

contracts from the Kansas Board of Regents (KBOR) to match KBOR enrollment and graduation

records for all public community colleges, technical colleges and four-year universities in the

state to employment records from the Kansas Department of Labor in order to analyze the

efficacy of KBOR programs.

In what follows, I share the lessons I have learned from working on policy-relevant

research using administrative and survey data from multiple governmental entities. The barriers

to obtaining data for evidence-based policy are significant and in some cases, insurmountable.

However, when researchers become "trusted partners" with policy-makers, the evidence

generated by administrative data is persuasive, and policies do change. Two projects illustrate

the barriers and successes I have encountered.

---

[2] "Kansas City Research Data Center." National Science Foundation SES-1359527.

A Tale of Two Projects

Barriers. In 2004, the National Science Foundation (NSF) funded my proposal: "Gender Differences in Employment Outcomes for Academics in Science and Social Science" SES-0353703. This grant proposed to merge publication data from Thomson-ISI's *Web of Science* onto the NSF's Survey of Doctorate Recipients (SDR) in order to examine whether productivity differences explain the gender gap in salary and promotion in academia. The SDR is a biennial, longitudinal survey that collects information on demographics, education, employment and earnings of U.S. trained doctorates in science, technology, engineering and mathematics (STEM) fields. Although the grant was funded in 2004, the creation of the SDR Productivity Database has been a work in progress ever since.

Essentially, a proposal to merge SDR data with other data sources puts legitimate research of importance to Congress[3] at odds with the Confidential Information Protection and Statistical Efficiency Act (CIPSEA) of 2002.[4] It took until 2006 for NSF to establish a policy to permit matching SDR data with other sources. In 2008, the NSF funded a research conference, "Collaborative Research: Workshop on linking NSF SED/SDR Data to Scientific Productivity" SRS-0725475 which brought together researchers interested in using the SDR Productivity data, statistical experts on linking data sets, and staff from the NSF Division of Science Resource Statistics to discuss the issues involved in creating the data with the least amount of matching error, ensuring its confidentiality, and providing access to the research community.[5] Between 2006 and 2009, I drafted several versions of the data-matching proposal, and ultimately in 2010

---

[3] This section of the testimony is an update of my testimony before the Subcommittee on Research and Science Education of the U.S. House of Representatives on the *Fulfilling the Potential of Women in Academic Science and Engineering Act of 2008.* May 8, 2008.

[4] One NSF staff member initially responded to my request to link publication data to the SDR by saying, "No, I could go to jail if we were to do so." This is presumably a reference to provisions in CIPSEA.

[5] Information from this conference is available at http://www.albany.edu/~marschke/Workshop/. The Division of Science Resource Statistics was renamed the National Center for Science and Engineering Statistics.

the National Center for Science and Engineering Statistics (NCSES) at NSF took over the

funding and oversight of matching publications and patents to the SDR.

   The creation of the SDR Productivity Database is still a work in progress, twelve and

half years later. I could not complete the proposed work in my original NSF grant, and I have

three projects that are still waiting on the data. The data have been matched and NCSES is now

reviewing the data quality before releasing it to researchers; something I hope will happen in

2017. However, NCSES dropped two-thirds of the SDR longitudinal panel between 2013 and

2015 waves of the survey, reducing the quality and viability of the SDR for future research, and

creating another barrier. It remains to be seen whether the SDR data are useful for my research

purposes beyond the 2013 wave.

   Successes. In 2008, I was contacted by Thomson Reuters/Discovery Logic (a contractor

for NIH) about assisting with a project to examine the diversity of NIH-funded researchers. The

NIH provided our research team with every variable I requested from NIH's IMPAC II

administrative database on over 88,000 NIH R01 grant proposals from 2000-2006 to examine

race/ethnicity differences in NIH funding. In the process of creating these data, our research

team linked publications and bibliometric measures for the principal investigators to the grant

proposals. Ironically, the work I proposed to do with the SDR, I was allowed to complete for the

NIH.

   The resulting paper was published in *Science*: "Race, Ethnicity, and NIH Research

Awards" was co-authored with Raynard Kington, former Deputy Director of the National

Institutes of Health, Walter Schaffer in the Office of the Director at NIH, and colleagues at

Thomson Reuters/Discovery Logic. Our study found that Asians were 4 percentage points and

black or African-American applicants were almost half as likely (13 percentage points) to

receive NIH investigator-initiated research funding compared to whites. After controlling for the applicant's educational background, country of origin, training, prior research awards, publication record, and employer characteristics, we found that black applicants remained one-third less likely (10 percentage points) than whites to be awarded NIH research funding.

The findings in Ginther et al. garnered significant media attention and changed NIH policy. As a result of the study, NIH Director Francis Collins appointed the Advisory Committee to the Director Working Group on the Diversity in the Biomedical Research Workforce. Based on the findings of the Working Group, NIH made a $500 million, ten-year commitment to improve diversity through increasing the number of underrepresented minorities who study biomedicine (Building Infrastructure Leading to Diversity) and creating a national mentoring network (National Research Mentoring Network).[6] NIH also hired a chief officer for Scientific Workforce Diversity.

Why did the NIH project change policy while the NSF project still languishes? The NIH study was initiated by a policy-maker, Raynard Kington, who at the time was Deputy Director of the NIH. Institutional support yielded immediate data access. In contrast, in 2004 I was a relatively unknown researcher asking permission to link data to the SDR shortly after a federal law made this type of request open to interpretation. No bureaucrat has ever lost his or her job by saying "no" to a researcher request. <u>Thus, in my experience, when the study is proposed by the policy-maker, access to the administrative data will be forthcoming.</u>

Evidence-based policy at the state and local levels. This iron-law of evidence-based policy research has played out again and again in my experience. In 2009 we started the Kansas City Area Education Research Consortium with the goal of creating a data repository for all

---

[6] NIH BUILD: https://www.nigms.nih.gov/training/dpc/pages/build.aspx. NIH NRMN: https://www.nigms.nih.gov/training/dpc/pages/nrmn.aspx.

Kansas City metropolitan school districts using the state longitudinal data systems (SLDS). But our vision for a data repository for Kansas City metropolitan area schools has never been realized, because the state departments of education in Kansas and Missouri did not trust KC-AERC as partners. In the case of Kansas, KC-AERC researchers obtained student-level data on two occasions for specific projects. In the case of Missouri, KC-AERC researchers developed a measure of teacher-value added using student-level data, only to have access to those data rescinded after the project was completed.

Despite our failure to develop lasting partnerships with the state departments of education, over time school districts learned about KC-AERC and started hiring us to conduct evaluation projects. As we became trusted partners, school districts provided administrative data to KC-AERC to evaluate a number of different programs.[7] The same has been true in our work with the Kansas Board of Regents. We have received funding for several contracts to link KBOR data to employment and earnings records in Kansas, evaluate the efficacy of adult basic education, high school technical education, and the graduation rates of community college transfer students. From the perspective of state and local policy-makers, "qualified researchers and institutions" need to be known, trusted, and local. Research studies based on other school districts or states do not have external validity for state and local policy-makers.

States are even wary about sharing data with the federal government: Kansas was the last state to sign an agreement with the US Census Bureau to allow its data to be incorporated in the LEHD. Currently states review all proposals related to using their LEHD data and retain the right of refusal for these projects. In addition, when 50 state governments make myriad changes to state-administered federal programs (e.g. TANF), the policy environment becomes very complex, very quickly. I have a new project that proposed to examine the impact of TANF

---

[7] See current projects at www.kcaerc.org.

policy changes. Welfare reform happened twenty years ago, but there are very few studies that have traced the impact of state TANF policy changes since then, in part because it is a very difficult and complicated policy environment to study. To the extent that other federal programs are block-granted to the states, our ability to understand how these policies affect outcomes may be severely compromised because so many state policies will be changing all at once.

Recommendations for the Commission

I offer two recommendations to the Commission. First, policy-makers are the key to implementing evidence-based policy. Thus, the Commission needs to think carefully about how to align the incentives for policy-makers to share their data and be receptive to findings. After completing the NIH study of race/ethnicity differences, I spoke with administrators in another science funding agency about conducting a similar study. These administrators declined my offer. Assuming that the Commission is successful in breaking down legal and administrative barriers, risk aversion on the part of policy-makers will remain a stubborn obstacle.

Second, I recommend that a series of experiments be conducted with federal agencies to incorporate evaluation of current programs and research design in new programs in order to evaluate their effectiveness.   In particular, I recommend that the Commission work with the science funding agencies (NIH and NSF) to develop prototypes for evaluating existing programs and incorporating evaluation into the design of new programs. I suggest the science agencies, because they will be predisposed to using evidence-based approaches to understanding their programs. I suggest these experiments and prototypes since it is useful to have evidence to support building evaluation into program design. I will provide some examples of how this might work using current programs that I am familiar with at the NIH.

After we published our paper in *Science*, NIH announced the Early Career Reviewer (ECR) program,[8] motivated by our finding that individuals who served on NIH study sections were more likely to receive NIH funding. However, our analysis did not demonstrate that serving as a reviewer had a causal effect on funding. NIH would know the causal effect of serving as a reviewer now if ECR applicants were randomly assigned to an ECR treatment or control group *when the program was started*.   These types of policy experiments could take two or three years to evaluate, but it would be useful to know whether the program works as expected instead of implementing the policy and hoping for the best.

NIH has also been concerned that the age of obtaining the first R01 grant has increased, and it created policies to maintain award rates for new investigators that were similar to experienced investigators.[9] This policy has been in place since 2008, and it would be possible to use quasi-experimental methods to evaluate whether NIH new and early stage investigator programs had the desired effect.

Conclusion

Chair Abraham and Chair Haskins, once again I thank you for this opportunity to testify today. I believe that evidence-based policy is critically important to the efficient allocation of governmental resources.   However, evidence-based policy is much easier said than done because policy-makers are the gatekeepers to their data. Evidence-based policy analysis cannot take place without the support of policy-makers. Thus, I encourage the Commission to consider ways to align policy-maker incentives to facilitate the goals of data access and robust evaluation. Finally, I recommend a series experiments be conducted with federal agencies to incorporate

evaluation of current programs and research design in new programs to demonstrate the

effectiveness and build support for evidence-based policy.

December 20, 2016

**Statement and Recommendations Concerning
Commission on Evidence-Based Policymaking**

by

V. Joseph Hotz
Arts & Sciences Professor of Economics
Duke University
Durham, NC 27708
hotz@econ.duke.edu

The following comments are related to comments submitted on behalf of the Population Association of America (PAA) and the Association of Population Centers (APC) on November 14, 2016. Nonetheless, all of the views and opinions expressed below are my own and ones I support.

Let me begin by applauding passage of the Evidence-Based Policymaking Commission Act of 2016, which created the bipartisan Commission on Evidence-Based Policymaking and charged this Commission with:

- determining how to integrate administrative and survey data and to make those data available to facilitate research, evaluation, analysis, and continuous improvement while protecting privacy and confidentiality;

- recommending how data infrastructure, database security, and statistical protocols should be modified to best fulfill the integration and increased availability of data as described above;

- recommending how best to incorporate rigorous evaluation into program design; and

- considering whether a federal clearinghouse should be created for government survey and administrative data.

In what follows, I focus my comments on two related issues: the data infrastructure to support evidence-based policy analysis and the importance of insuring access to these data for qualified researchers, both within and outside of government.

A. *There are important benefits to the use of administrative data, especially when linked, for conducting policy-relevant research.* Administrative records have been used in a variety of research areas and provide an essential source of data for conducting important policy-relevant research. For example, such records have been used to study participation in and impacts of social programs (e.g., welfare programs, manpower training, food stamps, the earned income tax credit, etc.) on various outcomes. Often these outcomes are measured with linked administrative data, such as wage earnings (from linked unemployment insurance wage records), health conditions (from linked Medicaid records) or fertility (from linked birth certificate records). The availability of administrative records from federal, state or local sources provide a cost-effective way of supporting evaluations of these programs, regardless of whether the evaluations made use

of randomized designs for allocation of program participants to different "treatments," or other studies that have made use of non-experimental designs.

But social program evaluation is not the only place where administrative records can and will be the primary source of data to monitor particular programs and/or evaluate particular policies or "treatments." Furthermore, they do not only use government records. Here I reference two examples. First, biomedical research, including research that is relevant to policies affecting health-related behaviors, such as smoking bans or regulation of the nutritional content of foods, uses increasingly electronic health records (EHRs) from public and private health care systems to measure the health effects of variation in such policies. Second, administrative records from private firms that construct credit scores for use by financial institutions have been used by researchers, including the research division of the New York Federal Reserve Bank, to monitor and conduct policy-relevant research on student loan debt in the U.S. In both of these areas, administrative records support important policy-relevant research in a way that is both cost-effective and potentially more accurate than data collected via other means, e.g. surveys.

B. *At the same time, there are important legal and other constraints that limit the use of administrative records and the ability of researchers to link records across different sources of these records.* In particular, different sources of administrative data are subject to varying and divergent laws and regulations that can inhibit their use. For example, administrative records from social programs administered at the state or local level (e.g., TANF programs) are often subject to laws and regulations that make it hard for one agency to share their records with another agency. And, as noted in the NRC report on the Reengineering of the Survey of Income and Program Participation (SIPP), existing state laws that cover the privacy and access of administrative records from TANF, Medicaid, unemployment insurance, and the workers' compensation programs make it very difficult, if not impossible, for these programs to share their data with the Census Bureau (or other) surveys like the SIPP.[1]

Historically, this issue has complicated the conduct of biomedical research that makes use of electronic (or non-electronic) health care records of individuals as institutional review boards (IRBs) have required studies to obtain informed consent from subjects in these studies for any follow-up use of subjects' EHRs and/or updating of these records. Recently proposed revisions to the Common Rule[2] will reduce and/or eliminate this re-consenting requirement for certain types of studies and types of administrative records so long as subjects are provided with a clear statement regarding potential future use of administrative records as part of their initial consent process. Many population scientists welcome this change and suggest it may represent a model for the Commission to examine as it considers how to facilitate access to records like EHRs while still providing participants with the opportunity to make informed decisions about research access to their records.

More generally, I strongly urge the Commission to investigate the various laws and regulations

---

[1] Constance Citro and John Karl Scholz, eds., *Reengineering the Survey of Income and Program Participation*, National Research Council, 2009. [NOTE: I served as a member of the NRC expert panel that developed this report.]

[2] HHS–OPHS–2015–008, Federal Policy for the Protection of Human Subjects, *Federal Register*, 80(173), Sept 8, 2015, 53933-54058.

governing access to administrative records for research purposes. In particular, I encourage the Commission to look closely at the laws affecting access to state and local government data and policies restricting record linkage across various federal agencies.

C. *To facilitate the conduct of evidence-based, policy-relevant research, I encourage the Commission to examine and improve access to administrative records to qualified researchers outside and inside the government.* I understand and appreciate that there are important confidentiality and security concerns that necessarily limit access of researchers to various types of government-based administrative records and/or restricted-use data sources. Furthermore, I appreciate why restrictions on the access of non-governmental researchers may need to be different, and possibly more restrictive, than that applied to researchers employed by authorized government agencies. But, at times, these restrictions have made access to such data very difficult for academic and non-governmental researchers.

Over the last 20 years, U.S. statistical agencies, initially led by the U.S. Census Bureau, have made great strides in improving access to restricted-use versions of federal data sources through the Federal Statistical Research Data Centers (RDCs) program. This program now allows access to data products from 12 different federal statistical agencies for qualified governmental and non-governmental researchers in 20 different centers around the country. While some the research covered by the data agreements approved for use of these centers is often not directly related to policymaking, much of it is.

A similar effort for providing access to data from the Internal Revenue Service (IRS) under the Joint Statistical Program of the Statistics of Income (SOI) Division of the IRS has enabled qualified researchers to submit proposals for access to IRS data and to link it to various data for research purposes. This program has facilitated a number of highly visible and widely cited lines of research by Professors Raj Chetty (Stanford) and Emmanuel Saez (UC Berkeley). For example, Chetty and co-authors analyzed the association between income and the life expectancy of individuals in the U.S. since 2000 by linking IRS tax records on income with Social Security Administration death records.[3] The findings of this research, especially the finding of differences by area in the associations of longevity by income, raises important questions about the sources of these disparities and how to alleviate these differences. Such research could not have been conducted without this program.

A large body of research shows that geography (e.g. neighborhoods) affects the social and economic well-being and health of individuals and families. But, state and local policymakers, researchers, and program officials often lack the data needed to measure differences in community environments, to isolate how neighborhood characteristics shape micro-level outcomes, or to test the efficacy of neighborhood-level interventions. Most survey data files lack such key contextual information, while most administrative data lack key demographic, socioeconomic, behavioral, and outcome information. While individual-level record linkage of survey and administrative data could provide such critical data for state and local-level evidence-based policymaking, most state and local researchers/program evaluators lack the resources to submit proposals and conduct these types of linkages and research within a RDC. The

---

[3] Chetty, R. et al. (2016). "The Association between Income and Life Expectancy in the United States, 2001-2014, *Journal of the American Medical Association*, 315(15): 1750-1766.

Commission should also encourage statistical agencies and other researchers to create spatially-linked administrative and survey data that could be provided to state and local researchers/program evaluators outside of RDCs to increase evidence-based policymaking at the state and local level.

I call on the Commission to encourage expanding access of data and records from federal, state and local sources to qualified non-governmental and governmental researchers. This expansion should include state and local government researchers, whose access to data can provide support for accurately assessing needs, creating programs to address those needs, and delivering services in more cost-effective ways. While such efforts may include expanding the RDC and/or IRS's Joint Statistical Programs or similar programs, they should also include expanding access to spatially-linked administrative and survey data that could be provided outside of RDCs. Efforts also may include providing more funding for merit-based grants to undertake these projects, especially in light of the limited resources available to researchers in local governments and those working in non-governmental settings.

I also encourage the Commission to consider recommending any necessary legal revisions that would allow federal statistical agencies to share data with researchers conducting evidence based research. For example, the Census Bureau's authorizing regulation, Title 13, does not explicitly recognize the use of sensitive data for conducting scientific research, be it policy-relevant or not, as a "benefit to the Bureau." Rather, Title 13 only supports data access to improve the quality of Census (and other) data products. A more explicit acknowledgment that qualified research projects can be conducted for scientific purposes would allow Census to approve studies using confidential data that are primarily designed to replicate existing studies and/or determine the robustness of findings from previous research. Such changes would help ensure the legitimacy of research uses of these data and give greater credibility to the findings based upon these data.

D. *I encourage greater attention be given to the population representativeness of the policy-relevant research produced using administrative records and population-based surveys to better assess and characterize the population-representativeness of findings from administrative data.* Many studies use administrative records to "evaluate" the impact of some particular policy or program. As I have argued above, the administrative records provide a potentially cost-effective way of conducting such evaluations—particularly when compared to the alternative of collecting survey data that is collected from a sample representative of the population relevant for the study. But such benefits of using administrative records in evaluative research does not mitigate the importance of assessing the sampling properties of this data source.

Consider the following example regarding the design of the Precision Medicine Initiative (PMI). One of the key components of the PMI's initial plan is to assemble a million-person sample of individuals who would provide access to their Electronic Health Records (EHRs) as a condition of the study. Access to EHRs on this large sample would provide data to study a wide range of health conditions, including conditions that are relatively rare and only affect population subgroups. One of the study's recruitment strategies was to use social media and other methods to attract participants who would grant access to their EHRs and undergo one or more physical examinations.

While the goals of the PMI are important and have the potential to provide evidence-based assessments of health conditions relevant for U.S. health policy, population scientists and other

4

social scientists are concerned about lack of attention to the properties of what amounts to a "volunteer" sample of people with EHRs, even if the sample includes data on one million participants. In public comments, PAA and APC raised these concerns and strongly suggested that the NIH leadership consider using existing population-based health studies to form at least part of the PMI cohort to assess the population-representativeness of the recruitment strategy based on volunteers. In developing both policies and best practices for policy-relevant research, I encourage the Commission to advocate for the designs of data collection that explicitly account for the sampling properties and population-representativeness of its studies.

Lastly, I encourage the Commission to ensure that population-representative data sources collected by the Federal government continue to be viewed as an important source of data for policy-relevant research, both as a way to monitor behaviors and phenomena relevant to public policy. For example, data sources like the Current Population Survey (CPS), the American Community Survey (ACS) and the Survey of Income and Program Participation (SIPP) all play roles in the monitoring and implementing public policy in the U.S. The CPS is the population-representative data that enables the BLS to construct estimates of unemployment and labor force participation rates of the U.S. population on a monthly basis. The ACS provides data on poverty rates at the lowest levels of geography, such as school districts and communities, which are used to allocate funding for programs such as the USDA's National School Lunch Program and State Children's Health Insurance Program (SCHIP). The SIPP has facilitated a broad range of research on the distribution of income and participation in a range of social programs using a survey that is designed to be population representative for most states in the U.S. These surveys, and others, are important components of the U.S. data infrastructure and are needed to support evidence-based policymaking.

**Comments to the Commission on Evidence-Based Policymaking
from Virginia Knox, MDRC**

January 5, 2017

My name is Virginia Knox, and I am the Director of the Family Well-Being and Children's Development Policy area at MDRC. We're a nonprofit, nonpartisan education and social policy research organization dedicated to learning what works to improve policies and programs that affect low-income individuals and families.

The ideas I'll outline today are laid out at greater length in written comments that MDRC submitted to the commission in November. MDRC hopes to see the Commission use its mandate to recommend that the federal government put rigorous evidence at the center of policymaking.

My comments will briefly outline six of the elements we see as necessary to achieving that goal:

- Validate the role of third-party evaluations

- Create a culture of continuous improvement

- Build on tiered evidence strategies

- Embed evidence within existing funding streams

- Improve access to administrative data (while acknowledging its limitations)

- And protect data confidentiality.

First is to validate the role of independent evaluation of programs and policies in the federal government: Evaluation findings that are credible, relevant, accurate, and timely are critical for policymakers and practitioners to make informed decisions about how to spend the resources of government. This is an issue of particular urgency in a time of budget constraints and fiscal austerity.

Second -- Create a culture of continuous improvement: Rather than being focused on up-or-down judgments about programs or policies, government should continue to develop incentives for using research evidence to make programs more effective over time. A good example is the Maternal, Infant, and Early Childhood Home Visiting (MIECHV) program, a large evidence-based federal initiative that has several elements

worth emphasizing:

- Rigorous prior evidence is being used to influence how federal funds are spent, making it more likely that the funds will make a difference for families.

- The legislation recognizes that innovation is important for any field to keep advancing, and offers states a subset of funds to test new approaches.

- Funds were also set aside for research to make sure that learning continues under MIECHV and can influence future realizations of home visiting.

Third -- Build on the tiered evidence strategies embodied in the Investing in Innovation Fund at the Department of Education, the Workforce Innovation Fund at the Department of Labor, the Teen Pregnancy Prevention Program at the Department of Health and Human Services, and the Social Innovation Fund at the Corporation for National and Community Service. These funds set clear guidelines about standards of evidence and provides incentives for both innovative new programs and for testing the scaling of models with evidence of effectiveness — which we see as truly the next frontier in the evidence-based policymaking agenda.

Fourth -- Embed evidence within existing funding streams: As the MIECHV example illustrates, when we have evidence of what works, we should build incentives into current funding streams to make sure that dollars follow the evidence. And while the innovation funds have been a source of effective new ideas for a given field, incorporating resources for research *within* major program funding streams would allow federal agencies to develop evaluation agendas that focus on continuous improvement of existing programs.

Fifth - Improve Access to Administrative Data

In evaluating the effectiveness of social programs, agencies and the researchers who evaluate their programs need ready access to administrative data. At the same time, access to administrative data is not a panacea, so we shouldn't dismiss the importance of surveys and other types of data.

There are at least four factors that affect the fit of administrative records for a given research study.
- Access – The process of gaining permission and approval to use the admin data may be cumbersome and expensive
- Standardization – if there are multiple sources of admin data and they are all in different formats, then the researcher will have to spend considerable time standardizing it before she can conduct the needed analysis
- Completeness - administrative records often do not include all the data required to answer important questions
- Data Lags - Federal data sets like the National Directory of New Hires or tax records can have very long lags before the data are assembled, cleaned, and available for use in a study. This has significant implications for timeliness and

limits the use of administrative data in quick-turnaround studies with multiple follow-up periods.

My sixth and final point is about protecting confidentiality.

There are a number of important tensions that underlie this high stakes issue. As an example, Congress is considering amending The Family Education Rights and Privacy Act (FERPA) because of concerns over threats to the privacy of student data, originally prompted by public outcry over educational technology vendors and their use of children's information for advertising and commercial gain. Unfortunately, education researchers from academia and other nonprofit institutions have gotten swept up in the furor.

Under current federal law, education agencies can share data with researchers only for research projects designed to benefit students and improve instruction — and only under extremely strict privacy conditions. But some are suggesting that Congress should significantly scale back even that authority. Indeed, many states are interpreting FERPA to preclude the sharing of any individually identifiable data with researchers, even though that data would only be reported in aggregate form for policy purposes. Without access to student data, little education research could be conducted at all. The bottom line is that it's essential to continue to protect the security and privacy of student data, but we must be careful to not unintentionally end the analysis of student data for its original purpose: assessing and improving education.

This is just one example of how we need to protect the privacy of data for people who participate in studies, while still making it possible to use available data to improve social policy.

Thank you for allowing me this time to provide input from MDRC into the important work of the commission.

Sincerely,

Virginia Knox

Commission on Evidence-Based Policymaking
Hearing, Chicago, January 5, 2017

Submission from: Institute for Social Research, University of Michigan, P.O. Box 1248, Ann Arbor, MI 48106-1248. Contact: Margaret Levenstein, Director, Inter-university Consortium for Political and Social Research and Research Professor, Institute for Social Research, MaggieL@umich.edu.

The University of Michigan's Institute for Social Research (ISR) is pleased to present the comments below for consideration as the Commission deliberates to expand access to and the use of government data for the purposes of building evidence-based evaluation of program and policy outcomes while concurrently protecting the privacy and confidentiality of the citizens and organizations studied. There are several general principles that we believe should guide the Commission as it examines opportunities to build and evaluate evidence-based programs and policies with administrative and survey data. These principles are woven throughout our comments to the Commission's questions below and are summarized as follows:

- Confidentiality of individual data and the independence of the federal statistical system must remain paramount. Participation in our federal data programs, whether they collect survey or administrative data, is premised on the promise that individual data will remain confidential and will be used for statistical purposes only. It is never to be used for enforcement purposes or for the benefit of particular commercial or political interests. Confidence in the estimates produced by our federal statistical system requires adherence to these principles at all times. As articulated in the Office of Management and Budget's Statistical Policy Directive No. 1 (2014), it is critical to "Protect the trust of information providers by ensuring the confidentiality and exclusive statistical use of their responses. Maintaining and enhancing the public's trust in a Federal statistical agency's or recognized statistical unit's ability to protect the integrity of the information provided under a pledge of confidentiality is essential for the completeness and accuracy of statistical information as well as the efficiency and burden of its production." This is just as true when administrative data is re-purposed for statistics. Undermining this trust undermines statistical measurement as well as the effectiveness of the programs upon which the statistics are based.
- Two important steps to uphold these principles and assure the independence and reliability of the estimates produced by our federal statistical system include the following:
    a. Data originally generated outside the federal system, either from state and local, commercial, non-profit, social media, web-based, or other programs, should be aggregated outside the federal system. These data can be cleaned and documented, and secure, confidentiality-protecting crosswalks to PII can be created. Data can then be transferred to the federal statistical system for matching to federal data resources. This will preserve respondent and data provider confidentiality and increase confidence in the security of the system. It

also provides a mechanism for state and local civil servants and third-party (e.g., academic researchers) to access the non-federal data in a secure environment without burdening the federal research data system and its supporting security clearance mechanisms. This is the model that has been adopted by the Institute for Research on Innovation in Science (IRIS) in its collaboration with the Census Bureau's Innovation Measurement Initiative. This model leverages the expertise of those outside the federal statistical system to improve, harmonize, and document the non-federal data. This kind of expertise is often lost or reduced when data are moved exclusively inside the federal statistical system.

b. Data generated by federal agencies and programs will almost surely be legally required to stay within the federal firewall. These data should be made available systematically (promptly, with transparent access procedures, and where there is no or limited documentation, with a mechanism for researchers to contribute to the data and documentation). This will harness the energies and expertise of researchers to improve the data resources of the federal statistical system as well as state-of-the-art analyses of policies in order to assure that the inference drawn from evidence is scientifically sound. This also assures that there is competition in program analysis, so that multiple approaches can contribute to the analysis and program evaluation. The Federal Statistical Research Data Centers are an important mechanism for providing researcher access to these data, but, given the significant ongoing hurdles to their use, they should not be the exclusive mode for researcher access.

Collaborations between federal agencies and academic organizations can help to address several challenges in using administrative data for evidence-based policy making. First and foremost, collaboration with multiple, external academic organizations can help to assure data availability without excessive centralization that might compromise Americans' right to privacy and security in the data that is generated by and about them in the course of their interactions with federal and state agencies. Second, collaboration between the federal government and academic organizations can bring to bear the efforts of the large number of faculty and students who would be willing to work to improve administrative data. This is particularly important as administrative data, like other non-design data, require significant investments in cleaning and documentation to assure that the target measurement concept is what is actually being measured. Third, those same academic collaborators bring with them expertise in both measurement and analysis that contributes to the scientific rigor of the policy analysis. Fourth, collaboration with academic and other research organizations increases the likelihood that multiple analytical approaches are considered, avoiding any tendency for monolithic or even self-serving analysis. Finally, this kind of collaboration develops skills, both on the part of the civil servants on whom we rely for producing the critical statistical resources of our country and and on the part of students who are the next generation of scholars and civil servants. This kind of collaboration will produce a generation of students who better understand the challenges of measurement and policy-relevant analysis as a result of their participation in such a

collaboration.

For example, the Institute for Research on Innovation and Science (IRIS), a collaboration of approximately 50 universities based at the Institute for Social Research (ISR) at the University of Michigan, provides an excellent model in which universities (mostly state, but also private) have voluntarily chosen to share confidential, proprietary data, including individual identifiers, with a federal statistical agency for the production of new estimates of the impact of national investments in research and development. IRIS has developed the capacity to ingest, harmonize, and de-identify transaction-level data from its member institutions. It uses these data to produce reports back to its members, restricted datasets available to the research community, and datasets that it transmits to the U.S. Census Bureau for linkage to Census data assets. The Census Bureau produces additional estimates and reports from these linked datasets, and makes the linked data available to qualified researchers with approved projects in the network of Federal Statistical Research Data Centers (FSRDCs). This model has been able to achieve the participation of a large number of institutions, systematic access for the research community, and a more valuable research dataset than was the case for an earlier initiative strictly within the federal government. These data provide the basis for an evidence-based evaluation of a wide range of federal and private programs investing in science and academic R&D. IRIS's model leverages the interest and abilities of the research community to analyze these data as well as leveraging the existing data resources of Census Bureau and the computing resources of the FSRDCs.

In another initiative, in this case between the Institute for Employment Research (IAB) of the German Federal Employment Agency (BA) and the University of Michigan's ISR, now expanded to five other U.S. universities and locations in the UK and on the Continent, hundreds of researchers have contributed to the analysis of German labor market reforms through their access to restricted, linked survey and administrative data.   These initiatives demonstrate both the feasibility and the value of academic-government collaborations in overcoming the challenges to creating appropriate data infrastructure and harnessing scientific expertise to analyze those data for evidence-based policy evaluation.

State and local governments produce large amounts of administrative data on programs that they implement, whether funded locally or by the federal government. State and local civil servants have important expertise and knowledge about the operations of these programs and, therefore, the meaning of the administrative data generated by them. They often lack the data or statistical scientific expertise or computing environments in which to analyze or link these resources. Partnerships between state and local governments, federal governments, and academic institutions can provide the relevant training while developing data resources of value to all parties for evidence-based program evaluation.

We recommend two complementary approaches to providing security and assuring privacy. One is to take steps to assure that the data are safe. This can be achieved through traditional anonymization methods (aggregation, suppression, swapping, and noise infusion), data

encryption, and the creation of fully or partially synthetic data. The other is to take steps to to assure that the researcher who analyzes the data is safe and is working in a safe computing environment. This is achieved through researcher training and credentialing, scientific peer review and pre-registration of research proposals, and the use of secure computing environments, such as virtual or physical research data enclaves. These two approaches are complementary. Many tasks associated with the work of turning administrative datasets into useful analytical datasets, including data cleaning, the production of metadata, and dataset linkages, can only be accomplished with access to identifiable data. This then requires secure computing *and* a system for training and vetting researchers. The UK's Administrative Data Research Service has made steps in the direction of researcher training and credentialing. The European Union's Data Without Boundaries project envisioned a researcher "passport" to facilitate credentialed access across the European statistical agencies. The Sloan Foundation has recently supported the Inter-university Consortium for Social and Political Research (ICPSR) to build on these earlier projects to establish durable researcher credentials for access to confidential data.

Exploiting the potential power of administrative and survey data for evidence-based policy and program evaluation requires that both government and non-government analysts are able to discover appropriate data resources and gain access necessary to analyze these data effectively. To address these needs, an infrastructure characterized by rich metadata about administrative and survey data sources, a secure platform for researchers to analyze datasets held in other locations, and a standardized and broadly accepted system of researcher credentialing must be developed. The existing network of Federal Statistical Research Data Centers provides an important mechanism for non-governmental researchers to contribute their expertise to the challenges faced by the federal statistical system and to the evaluation of programs.

- The adoption of standardized researcher credentialing, accepted by multiple federal statistical agencies, similar agencies in other countries (such as the German IAB and UK Data), and non-governmental providers of confidential data to the research community (ISR, NORC, RTI) can reduce barriers to accessing data by enabling qualified researchers to analyze data through a modality that is appropriate to their level of data-security training and experience. It also assures that access is obtained for legitimate research purposes on an equitable basis.
- In order to make data useful, and the research arising from it replicable, investments should be made in data documentation via well-defined metadata fields, and infrastructure should be built that enable researchers to locate and analyze datasets held in multiple, distinct, secure locations. Community curation, provided by researchers who are invested in understanding the data and enabled with appropriate software, can assist in building this documentation.

The characteristics of a data-sharing infrastructure designed to increase the availability and use of government data for evidenced-based program evaluation include:

- Robust search and browse capabilities that leverage standardized metadata, permitting researchers to discover data and learn about data in depth
- Capacity to facilitate crowdsourcing (active curation) and improvement of metadata to capture and leverage newly acquired knowledge about the data
- Capacity to recognize varying levels of credentials assigned to a researcher ID
- Functionality that enables researchers to analyze datasets held in multiple, distinct, secure locations, that is, a computing backbone that can support secure, multi-party computing.

Two white papers prepared for the Commission on Evidence-Based Policymaking by the Office of Management and Budget, "Using Administrative and Survey Data to Build Evidence" and "Barriers to Using Administrative Data for Evidence Building," explicitly point to the key challenges. These include statutory prohibitions that hinder access to the data; policy and legal interpretations, which can vary across agencies and federal, state, and local governments; and resource and capacity constraints, specifically the lack of appropriate and reliable infrastructure to address data sharing and access, management and curation of data, and security and privacy concerns.

The Longitudinal Employer-Household Dynamics/Local Employment Dynamics data program is our best example of such a collaboration. LEHD highlights both the enormous potential and the enormous challenges to creating and making use of linked state and federal data. This collaboration has made possible very important new data assets which have revolutionized our understanding of local and internal labor markets, job creation and destruction, and job mobility for workers in different industries, cohorts, and demographic groups. These valuable data remain underutilized because of limitations to access. Providing resources to strengthen state and local government statistical capacity would allow those agencies and their civil servants to participate more effectively in research using these data. Increased capacity within state and local governments would allow these agencies and civil servants to benefit from collaboration with external researchers and reduce their incentives to impede research.

There are benefits and limitations to both the single- and multiple-clearinghouse approaches. Overall we endorse a principle of union catalogs, so that data can be discovered and compared. A single clearinghouse would facilitate the process of finding and gaining access to the data and potentially linking multiple datasets. A clearinghouse would also act as a single point of entry for an analyst searching for appropriate data with which to address his/her question, and one might expect that a single catalog would have the benefit of consistent metadata to assist the researcher in evaluating the options and identifying the most useful source of data. Having a single clearinghouse to more efficient linking of datasets, for example if the clearinghouse functioned as a trusted third party and provided de-identified, linked data to researchers. A single clearinghouse, using appropriate software to track dataset versions would also increase reproducibility of analyses by make it easier for researchers and policymakers to identify a specific instance of a dataset. Given that administrative datasets are updated regularly as new

data are generated versioning of data is particularly important for rigorous and reproducible analysis. The most important benefit to a single clearinghouse is that it would reduce the bureaucratic hurdles to analyses that required to access multiple datasets; on the other hand, these hurdles creates checks and balances and privacy protection that can be undermined by centralization.

Multiple clearinghouses, however, would allow for specialization and expertise around particular data sources and/or types (which lends itself to strong user support as well) and the flexibility to respond more efficiently to changes in formats or uses of data in a particular domain. One of the challenges to using administrative data for research and analysis is the lack of accompanying documentation about the fields in the dataset. A series of specialized clearinghouses could begin to address this because domain-specific staff expertise could, over time, be used to create such documentation -- for example, noting when the underlying meaning of a particular field has changed or even simply pointing out that distributions on key variables changed at a specific point in time so that the researcher could do the detective work necessary to figure out why. Having multiple clearinghouses also spreads and develops the capacity necessary in both person-power (tagging, data checking, user support) and hardware/software for storing and disseminating the data across multiple organizations. This decentralization provides robustness to the infrastructure while increasing privacy protections.

An efficient and privacy-protecting solution would be to have integrated data catalogs and multiple clearinghouses, but secure, multi-party computing across clearinghouses and common standards to gain access to data, including:
- common researcher credentials
- peer review and pre-registration of research project proposals
- data use agreements
- required metadata fields

High quality data requires investment in curation. High quality analyses require investment in training researchers and civil servants and providing them with up-to-date computing facilities. Democracy requires that the data be well-protected. All of these require resources that have to be provided by someone.

One model for self-sustaining data access is the consortium model. Most relevant to the types of data discussed here is the Institute for Research on Innovation and Science (IRIS), a project based at the University of Michigan's Institute for Social Research. Started with funding from external sources, IRIS's model was to become self-funded by charging institutions (colleges and universities) an annual membership fee. This fee provides the member institution with campus-level reports based on their data, a seat at the table to help prioritize and design future IRIS products and initiatives, and access to de-identified and aggregate IRIS data for researchers on their campus. One benefit to universities is that, although they are required to deposit data about their campuses with IRIS annually, the IRIS staff has automated the ability to produce charts and reports based upon those data (possible because the same information

fields are collected from each institution). An organization or government agency that is required to share data and/or provide reports based on those data can find that it is in their interest to pay those with the skills and resources to properly support the data sharing efforts to carry out those tasks rather than reinventing the wheel and building that capacity within each agency. The data center providing a service such as creating reports or demonstrating use of the data within the research community is seen by the data producer as an added benefit. Similarly, the Inter-university Consortium for Political and Social Research (ICPSR) began as a consortium of 22 institutions in 1962 and continues the model with over 760 member institutions today. These institutions pay an annual membership fee in exchange for access to data curated (and tools created) using member funding as well as reduced tuition for students enrolling in the ICPSR Summer Program in Quantitative Methods of Social Research.

It is important to remember, however, that there is no free lunch; if we want better data and better analysis than currently exists, resources will have to be obtained to support this. The value of this research may well provide the basis for self-financing, but it is more likely that such research creates positive externalities without the ability to generate much revenue to support it.

It is critical that administrative and survey data held by government agencies be made available to qualified researchers and institutions for scientific research and evidence-based analysis. Such access provides the policy community with much greater resources for informing policy decisions than if we rely exclusively on government analysis. It also increases the likelihood that there is diversity in the analytical approaches brought to bear on important policy questions.

"Qualified researchers and institutions" should be established through external scientific peer review of proposals and a system of researcher credentialing that creates an incentive for researchers to be good data stewards. Because of the current lack of consistency across agencies in defining these terms, ICPSR is undertaking a project to research, propose, and test recommendations for researcher credentialing, the result of which will be a tiered set of characteristics that describe "qualified researchers and institutions." These characteristics will stem from those currently employed/accepted by providers of restricted data, in so far as those requirements are related to protecting against disclosure risk (i.e., not requirements put into place to add bureaucracy or additional "hoops" that must be jumped for data access). We anticipate using factors such as whether one has completed requisite training in ethical data use, is employed at an accredited academic institution, has secured federal funding, and proposes a project that is scientifically sound and that requires access to the data in question.

The ability to disseminate data using a variety of modes (providing metadata only, synthetic data, use restricted to a physical or virtual enclave, or encrypted download) also allows for flexibility in determining access. That is, if a researcher does not have accepted credentials, or is not affiliated with an institution with appropriate technical and legal protections for data, a researcher might still be allowed access to de-identified data. More sensitive data can be restricted to access in a virtual or physical data enclave. In other words, the same data may be

made available to different researchers under different access modalities based on the characteristics of the researcher and the sponsoring institution.

The integration (linking) of administrative and/or survey data in a clearinghouse without question increases the risk of disclosure of entities within the data; however, the federal statistical community and the research data community have a long history and reputation for protecting confidentiality. This reputation must be maintained and protected by adhering to the Office of Management and Budget's Directive 1 (2014). Policies to maintain these protections and the reputation of and confidence in the statistical agencies of the United States include:

- Providing access only to credentialed analysts with well-articulated research plans and objectives
- Provision by the clearinghouse of disclosure review of output, notes and other materials that are to be taken out of the clearinghouse (secure environment) to prevent unintended disclosure of subjects within the dataset(s)
- Developing and implementing privacy preserving analytical techniques as well as disclosure avoidance techniques such as creating synthetic populations that preserves statistical information

Clearinghouses can and should require researchers or analysts to submit a detailed proposal of the project for which the data are to be used, specifically addressing why the dataset in question is necessary for addressing the research question. Once these are vetted, by scientific peer review, clearinghouse staff and perhaps an external review board representing the data producer and the study population, a conclusion can be drawn on whether the benefits of the research project outweigh potential risks. Other restrictions should be consistent with the factors listed above -- explicitly agreeing to use the data in an ethical manner (and potentially demonstrating completion of training in doing so), restrictions on the computing environment in which the data can be analyzed, agreeing to terms of use, and the like.

There are a number of private and governmental organizations that offer technological options for data sharing and management. Colectica, a Minneapolis-based firm, is an example of a research and development firm specializing in data management, integration services, and Internet technologies for government, academic, and commercial computing; it offers a range of highly specific products and services useful for supporting data sharing and management. They offer tools for working with metadata using a variety of documenting standards (e.g., the Data Documentation Initiative, DDI,). Colectica also has a portal that offers search, browse, visualization, and data management capabilities.

Other projects exist that could offer either the technology or the functionality considerations that would be helpful. One such project is the Sustainable Environment/Actionable Data (SEAD) project, funded by the National Science Foundation and based at the University of Michigan. SEAD provides a collaborative platform for researchers to curate their data as they undertake analyses, so that the documentation is created and captured and can be harvested when the

data are shared (i.e., in a clearinghouse). A number of organizations, such as ICPSR, NORC, and the Michigan Center for the Demography of Aging, use technology to create virtual spaces in which researchers can analyze data that have significant disclosure issues. Generally, these spaces require the researcher to log in to a server housed at the data provider, conduct their analyses, and have output vetted before it is released to them. These virtual data enclaves often disable connections to the internet, print functionality, email, and other programs/features that might compromise data security. Lastly, software (e.g., Fedora) exists for creating and managing digital repositories and could be employed by a clearinghouse.

Resources to train civil servants in state, local, and federal agencies to evaluate their own data will also increase their capacity to learn from and absorb the analyses done by others. The implementation of *multiple* randomized control trials could also reduce the inclination to limit data sharing, as analyses can examine the question of which policies or interventions should be supported at scale (not simply whether an individual policy or program should be continued). Building continuous evaluation and improvement, based on progress toward measurable objectives for the relevant population, into policy design provides programs with incentives to collect and analyze data in order to identify potential improvements.

We should also work to develop a culture that highlights the intrinsic benefit that most civil servants, researchers, and the general population receive from having better answer questions about program effectiveness and other social issues. Researchers and civil servants will then be more likely to suggest improvements to data collection (methods and/or content) that would provide more effective analytic data to use in program evaluation. Researchers who are analyzing data are also likely to catch anomalies or potential inaccuracies that might be missed without researcher engagement. Having multiple researchers with multiple perspectives working with the same data will support models that might be more robust than if a single party were solely responsible for producing the evaluations. The research community's embrace of data transparency and replicability may provide reinforcement to governmental agencies to adhere to similar principles. Sharing data among agencies and with researchers increases the return on investments in data creation. It is more efficient use of government resources. It is rarely the case that a single researcher or organization can study everything that can be examined using a given data source. Differences in disciplinary perspectives mean that data collected for one purpose might be seen by another investigator as having value for his/her project that is completely different. Our statistical agencies employ dedicated civil servants who value improvements in the quality of measurement that they produce for our country. Recognition and respect for these values and these individuals will enable them to be more effective and take the steps necessary to continuously improve our data infrastructure.

There are currently significant barriers in accessing and using such data, including challenges in discovering the existence and location of appropriate data, uncertainty about legal infrastructure and processes for providing access to data, lack of documentation of file contents or data provenance. There are also limited resources for analyzing data (e.g., appropriate training for

government employees and non-governmental researchers, appropriate computing infrastructure).

Simply using such information is the first step. Organizations may collect data from program participants but not use it in evaluating the effectiveness of the program, may create summary statistics based on the data but not move further into more sophisticated statistical models, and/or may not be aware of existing research that could inform program/policy decisions. The ability to link data sources provides an opportunity to put data about program participation into context in ways that have not been possible before. For example, having information about students' performance for a given school by itself is helpful, but having the ability to link the information to such things as parental earning records and teacher characteristics allows an educational policy analyst to determine which shifts in student performance are likely a result of new policies implemented at the school, characteristics of the school or teachers themselves, or other issues related to outside influences such as food insecurity. Comparing data across similar contexts or programs is helpful in that the similarities and differences between the contexts create quasi-experimental designs, allowing researchers to identify the parts of the program that are most effective and those where improvement might be needed. Making data available to researchers also provides an avenue for dialogue between academics and policymakers that otherwise might not exist.

Program and policy evaluation should be included in program design so that evaluation is based on evidence that is available and analyzable by multiple, even competing, research teams, held to standards of reproducibility so that all parties can learn from evidence as it accrues in the process of program implementation.

Commission chair Abraham, Commission co-chair Haskins, other commissioners and Dr. Martinez, thank you for holding this hearing today and including me in it.

The development of a statistical infrastructure that integrates administrative and program data, as well as commercial and other non-designed data, has enormous potential to provide the basis for improvements in our knowledge and understanding of the impact and effectiveness of alternative policies. This is an extremely important effort, and I commend you for working to build the statistical infrastructure that we need to create an empirical, evidence-based foundation to undergird policy discussions.

I'd like to emphasize today the important ways that collaborations between federal agencies and academic organizations can help to address several challenges in using administrative data for evidence-based policy making.

First and foremost, collaboration with multiple, external academic organizations can help to assure data availability without excessive centralization that might compromise Americans' right to privacy and security in the data that is generated by and about them in the course of their interactions with federal and state agencies. Confidentiality of individual data and the independence of the federal statistical system must remain paramount. Participation in our federal data programs, whether they collect survey or administrative data, is premised on the promise that individual data will remain confidential and will be used for statistical purposes only, and is never used for enforcement purposes or for the benefit of particular commercial or political interests. As articulated in the Office of Management and Budget's Statistical Policy Directive No. 1 (2014), it is critical to "Protect the trust of information providers by ensuring the confidentiality and exclusive statistical use of their responses." This is just as true when considering administrative data rather than the responses of survey participants. Undermining this trust undermines statistical measurement as well as the effectiveness of the programs which the statistics are intended to measure.

Collaboration with academic organizations can help to address this privacy challenge by providing the basis for a network of data resources that can be analyzed jointly, without concentrating data within a single federal agency. As an example, IRIS, the Institute for Research on Innovation and Science, a collaboration of dozens of universities based at the University of Michigan's Institute for Social Research, is aggregating administrative data from those universities into a single data infrastructure. Those data can be shared with and linked to federal data assets, but they are produced and reside outside the federal government. Other academic collaborations are doing the same for administrative data from state and local governments on K-12 education, criminal justice, transportation, and land use.

This model of a networked data infrastructure, based on collaborations between academic organizations and federal statistical agencies, allows us to reap the benefits from using administrative and program data, especially given the emerging capabilities of secure multi-party computing, without the potential threats to privacy that might be associated with a more centralized system.

Second, collaboration between the federal government and academic organizations can bring to bear the efforts of the large number of faculty and students who would be more than willing to work to improve administrative data. This is particularly important as administrative data, like other non-design data, require significant investments in cleaning to assure that the target measurement concept is what is actually being measured. Investments in preservation and documentation are necessary to meet basic scientific standards of reproducibility; crowdsourcing improvements to data and metadata from the academic research community can do at least some of this. The creation of good documentation and metadata is critical to the effectiveness of a networked system, as it allows for the creation of a "union catalog" of data, and coherent analysis of data, even when those data resources are located in different places. Given the very real resource constraints of the federal statistical agencies, effectively leveraging these external resources is critical to the construction and design of a rigorous statistical infrastructure.

Third, those same academic collaborators bring with them expertise in both measurement and analysis that contribute directly to the scientific rigor of the policy analysis.

Fourth, collaboration with academic and other research organizations increases the likelihood that multiple analytical approaches are considered when evaluating a policy or program, avoiding any tendency for monolithic or even self-serving analysis. Open access to alternative, competing approaches to analytical questions provides the basis for legitimacy of the analysis that is done with administrative data and increases the public's trust and willingness to have data about them and their activities used in this way.

Finally, this kind of collaboration develops skills, both on the part of the civil servants on whom we rely for producing the critical statistical resources of our country and on the part of students who are the next generation of scholars and civil servants. The civil servants who make up the federal statistical system deserve our respect and appreciation. We need to elevate their status, and we do that, not by isolating them within the federal bureaucracy, but by allowing them to engage with their academic peers. This kind of collaboration will also produce a generation of students who better understand the challenges of measurement and policy-relevant analysis as a result of their participation in such a collaboration.

Thank you for your attention and consideration, and thank you for the work that you are doing to modernize our statistical infrastructure, the very basis of our knowledge of ourselves and our society.

Submitted December 6th 2016

<u>Written Statement for the Commission on Evidence-Based Policymaking</u>
<u>Public Hearing in Chicago, January 5th, 2016</u>

Introduction

The Abdul Latif Jameel Poverty Action Lab North America (J-PAL NA), based in the Department of Economics at the Massachusetts Institute of Technology, leverages scholarship from 143 affiliated professors to generate and disseminate rigorous evidence about anti-poverty policies. J-PAL NA provides pro-bono technical support, capacity building, and matchmaking with researchers to government agencies and nonprofits seeking to design and implement randomized evaluations, many of which rely extensively on administrative data. Affiliates in our network have conducted 154 ongoing or completed randomized evaluations in North America across sectors such as health care, housing, criminal justice, education, and labor markets. J-PAL NA also creates training materials to build research capacity, including a comprehensive, practical guide to obtaining and using administrative data for randomized evaluations.[1] We appreciate the opportunity to submit a statement to the Commission on Evidence-Based Policymaking.

J-PAL affiliated researchers have relied heavily on administrative data to conduct policy-relevant research. Data from IRS tax records enabled an almost 20-year follow-up of families involved in the Moving to Opportunity Experiment. The follow-up study demonstrated that young children who moved to low-poverty neighborhoods increased their college attendance and expected lifetime earnings.[2] Data from the U.S. Department of Education, the Ohio Board of Regents, and the National Student Clearinghouse collectively enabled a randomized controlled trial showing that simplifying the financial aid application process increased college attendance and persistence.[3] Data from hospitals in the Portland area revealed that Medicaid insurance, for which opportunities to apply were allocated through a lottery in Oregon, increased emergency room usage by 40 percent.[4] Access to administrative data was critical to generating these insights.

Executive Summary

This statement reflects J-PAL's expertise concerning randomized evaluations, administrative data access, and collaboration between government agencies and external researchers. It

incorporates recommendations from an open letter penned by several leading economists, including multiple J-PAL affiliates[5], and a short paper published by a subset of the same authors.[6] This comment elaborates on these key recommendations:

- Establish clear data documentation and standard data request forms, building on the example set by the Centers for Medicare and Medicaid Services.
- Expand secure access to real microdata to qualified researchers, prioritizing secure remote connections while also increasing capacity at Census Research Data Centers.
- Develop a data clearinghouse within the Census Bureau for currently hard-to-access data, particularly microdata on earnings and income, and link the data across agencies.
- Avoid flat per-user fees for data access to encourage validation and double-checking of data analysis.
- Clearly articulate program objectives and build ongoing process evaluation into every program to lay the foundation for impact evaluation.
- Institutionalize a process for identifying questions for program evaluation and appropriate conditions for randomized evaluations, focusing on three cases:
    - Demand for a program exceeds capacity to supply the program.
    - Gradual roll out of a program to different individuals or locations over time.
    - Refinement or reconsideration of eligibility criteria for a program.

Responses to Specific Questions Posed in the CEP Request for Comments

3. Based on identified best practices and existing examples, how should existing government data infrastructure be modified to best facilitate use of and access to administrative and survey data?

Build on the example of the Centers for Medicare and Medicaid Services to establish clear data documentation and standard data requests.

Existing government data infrastructure should incorporate standard data request forms with clear data dictionaries, using the Centers for Medicare and Medicaid Services (CMS) Research Data Assistance Center (ResDAC) data documentation as a model of best practices. The ResDAC system allows researchers to understand specifically what variables are available and to submit requests with data protection plans. Because the ResDAC system allows CMS to review those requests systematically as opposed to on an ad hoc basis, ResDAC facilitates routine, secure access to administrative data that culminates in several hundreds of medical studies each year.[7]

Applying the ResDAC model to an administrative data clearinghouse or other data repositories would allow researchers to see exactly what variables they are permitted to request, along with a

[7] Ibid.

brief description of each variable, before submitting a request. This explicit listing of available variables would enable data discovery and save program administrators and researchers hours of valuable time by avoiding long correspondences about whether the desired data exist. Publicizing exactly which variables exist and what agency houses the data increases transparency with no risk of revealing personally identifiable information. Better data documentation can thus facilitate use of and access to administrative and survey data without raising concerns for data security and privacy protection.

Moreover, sensitive variables that would trigger additional levels of review or security could be clearly labeled as sensitive as part of this clearer data documentation. Currently, researchers may request a variable that is not central to their analysis, without realizing that it captures sensitive information. This could delay or jeopardize the entire request or allow access to sensitive data that, with clearer data documentation, would not have been requested from the agency.[8]

4. What data-sharing infrastructure should be used to facilitate data merging, linking, and access for research, evaluation, and analysis purposes?

<u>Expand secure access to microdata to qualified researchers through remote and on-site connections rather than creating synthetic data.</u>

An optimal infrastructure for integrating administrative, survey, and statistical data to facilitate research and evaluation while ensuring data security and privacy will provide secure environments where qualified researchers can directly access microdata. Microdata enable researchers to perform more informative analyses by controlling for individual characteristics (such as educational attainment or race) to better determine the impact of a program. Microdata also allow researchers to evaluate how a program affects specific subpopulations, such as low-income individuals. Researchers can use microdata to validate and adjust their analysis as they learn from the data in real time—a crucial step in the research process. Moreover, for analysis in rigorous randomized evaluations, researchers require microdata to link individuals to their treatment status.

There are currently twenty-four Federal Statistical Research Data Centers (RDCs), which are physical, secure environments established through partnerships between the Census Bureau and research institutions where researchers who have undergone special sworn status can access restricted microdata. However, capacity in these RDCs is limited, both physically and according to Census bandwidth, and access is artificially restricted to researchers based on geographic proximity rather than on the merit of their research proposal.[9] Similar constraints apply to researchers working with statutorily restricted tax data through contracts with the IRS Statistics of Income Division (SOI)—the type of arrangement that enabled the Moving to Opportunity follow-up study. The SOI is small, has a limited budget, and can accommodate few research projects at a time. [10] More secure, direct access to microdata should be provided in two ways: (1)

[9] Card et al., "Expanding access to administrative data," 2010b.
[10] Office of Management and Budget, *Barriers to Using Administrative Data for Evidence-Building* (white paper submitted for the Commission on Evidence-Based Policymaking, July 15, 2016). https://www.whitehouse.gov/sites/default/files/omb/mgmt-gpra/barriers_to_using_administrative_data_for_evidence_building.pdf

preferably through remote, secure connections such as the "flexiplace" systems used by federal employees who work with restricted data from home, but also (2) through expansion of on-site secure environments in the form of additional space and funding for Research Data Centers and similar centers at other statistical agencies.[11]

Synthetic data, one alternative to expanding remote and on-site secure connections to restricted data, are a far inferior option for enabling policy-relevant research and program evaluation. Synthetic data are constructed to mimic certain features and aggregate characteristics of real data without containing real individual-level information. Although this appears—on its surface—to enable research while protecting privacy, synthetic data suffer severe disadvantages relative to real microdata. Synthetic data may be incompatible with randomized evaluations and other rigorous program evaluations because researchers must be able to link individuals to their treatment status—i.e., whether a particular person received a program or not. Furthermore, synthetic data make it difficult or impossible to study subpopulations, such as low-income individuals, which may be of particular policy interest. Researchers would have to specify each subpopulation they intend to study and all necessary contents of the data in advance. This may be impossible, in part because researchers often revise their analyses to address observations they learn from the raw data.[12] Meanwhile, data administrators would have to create new synthetic datasets for each request to study a specified subpopulation, which would require significant infrastructure and personnel.

7. What data should be included in a potential U.S. government data clearinghouse? What are the current legal or administrative barriers to including such data in a clearinghouse or linking the data?

<u>Establish a data clearinghouse within the Census Bureau for currently hard-to-access data, particularly microdata on earnings and income.</u>

For reasons discussed in response to question 4, the data should be real microdata rather than aggregated, de-identified, synthetic, or perturbed data. The clearinghouse should prioritize data that do not already benefit from strong infrastructure for access. Specifically, a clearinghouse should be developed for federal income and earnings microdata and focus on enabling researchers to link these data to the extent legally possible.

Income and earnings data have less well-developed access infrastructure and face several legal barriers to use for program evaluation, meaning that the clearinghouse would not be redundant.[13] For example, individual states maintain their own data system for Unemployment Insurance (UI) records, with individual discretion and statutory protections on providing access to this data. The Department of Labor does not store the data in a central location. Although the Census Bureau has made a significant contribution to accessing state UI data through the Longitudinal Employer

[12] Ibid.
[13] Ibid.

Household Dynamics Program (LEHD), the LEHD program requires that researchers be on-site at a designated Research Data Center.[14]

With infrastructure secure enough for the highly restricted data from UI and tax records established, the clearinghouse should then focus on facilitating linkage of these data with other, less restricted data. Federal data on income, namely tax records or Unemployment Insurance records, are in high demand because income can serve as a key outcome variable for many government programs or policies in education, job training, criminal justice, and place-based interventions.[15] For example, earnings—as measured by tax records—was a key outcome variable in the follow-up study of the Moving to Opportunity Experiment.

8. What factors or strategies should the Commission consider for how a clearinghouse(s) could be self-funded? What successful examples exist for self-financing related to similar purposes?

Avoid flat per-user fees for data access to encourage validation and double-checking of data analysis.

As is customary, a clearinghouse may charge fees for accessing data, such as a fee per project, a fee for sets of users, or an initial fee for the first user followed by much smaller fees for additional users. It should not charge the same flat fee per person for accessing the data because this severely discourages the double checking crucial to correcting human errors. Despite its clear data request process, CMS charges a fixed fee of $25,000 per person who accesses identifiable data through their Virtual Research Data Center.[16] This may create problems because researchers often need multiple people to work with the data to ensure accuracy—including people who effectively proofread to correct for human coding errors. With fixed per-person costs, researchers either pay a large inflexible sum of money for someone to double check the analysis or—facing tradeoffs given limited research funds—forego a set of "fresh eyes" to double check the analysis at risk of making mistakes. Therefore, by creating a high marginal cost to adding additional users, charging a fixed fee per data user effectively institutionalizes mistakes.

18. How can or should program evaluation be incorporated into program designs? What specific examples demonstrate where evaluation has been successfully incorporated in program designs?

Clearly articulate program objectives and build process evaluation into every program to lay the foundation for impact evaluation.

Process evaluation is always needed and constitutes a critical prerequisite for impact evaluation. It is not sensible to ask whether the program is succeeding or failing to deliver outcomes without first knowing whether the program itself is being delivered with fidelity. In some cases,

important questions about how a program can or should function may be sufficiently answered by process evaluations, needs assessments, or literature reviews. Rigorous impact evaluation, particularly randomized evaluation, should be pursued when the benefits in terms of knowledge generated would likely outweigh the costs of the evaluation, and when planning during program design can facilitate impact evaluation. [17]

Many components that aid process and impact evaluation should be developed during program design:

- Precisely articulated program objectives.
- A needs assessment clearly articulating the problem that the program will address.
- Standard outcome measures used in research literature about similar programs that allow potential impact evaluation results to be compared to those in other studies and used in cost-effectiveness analyses.
- A plan for data collection and flow from program practitioners to administrators. This includes planning in advance to collect identifying information, such as Medicaid ID numbers, to enable later matching of program-level records to administrative records for impact evaluation.

As an example of incorporating evaluation into program design, Benefits Data Trust (BDT) is working with J-PAL North America in an ongoing randomized evaluation of different outreach strategies to increase enrollment in the Supplemental Nutrition Assistance Program (SNAP) among eligible but unenrolled individuals in Pennsylvania. BDT had a clear grasp of the need its program addressed: despite awareness among eligible households that SNAP exists, many people could not imagine navigating the enrollment process alone. BDT had the clear program objective of increasing benefits enrollment, and change in program enrollment is a standard outcome that could be compared across different studies. BDT and researchers agreed that based on a review of the existing research, there was little rigorous evidence about what interventions can increase SNAP enrollment.

Although BDT was already providing enrollment assistance and sending outreach, BDT worked with researchers to design and test two distinct outreach activities—one high-touch intervention including a letter plus enrollment assistance and one low-touch intervention including a letter only. The researchers also worked with BDT to design a new letter for the evaluation based on marketing and psychology literature. Seeing quickly that this newly designed letter was more effective, BDT plans to incorporate this letter design in other states outside of Pennsylvania. Ultimately, the impact of the different outreach strategies will be measured using administrative data, which can be accessed according to a data use agreement with the Pennsylvania Department of Human Services.

19. To what extent should evaluations specifically with either experimental (sometimes referred to as "randomized control trials") or quasi-experimental designs be

---

[17] Glennerster, Rachel, and Kudzai Takavarasha. *Running randomized evaluations: A practical guide*. Princeton University Press, 2013.

institutionalized in programs? What specific examples demonstrate where such institutionalization has been successful and what best practices exist for doing so?

<u>**Institutionalize a process for developing specific research questions and determining the appropriate conditions for randomized control trials or other evaluation methods.**</u>

Federal agencies should institutionalize a process of developing high-priority research questions and determining the most appropriate evaluation methodology, following the precedent set by the Social and Behavioral Sciences Team (SBST). SBST launches demonstration projects—usually in the form of randomized evaluations—to rapidly evaluate low-cost applications of behavioral science to achieve desired outcomes, such as increasing workplace savings plan enrollment among military service members or increasing the rate at which indebted graduates apply for income-based loan repayment plans.[18]

When properly designed and implemented, randomized evaluations rigorously demonstrate the causal impact of a program by establishing the counterfactual—what outcomes would exist for program participants if they had not received the program. Random assignment ensures that, with a large enough sample, the group that receives the program and the group that does not are similar on average before the start of the program. Therefore the impact estimate from a randomized evaluation offers confidence that any differences in outcomes between the two groups are a result of the program. The ability to isolate program impact from self-selection or other confounding factors is why randomized evaluations are widely recognized as a highly credible method for estimating program impact. Where there is little internal experience implementing randomized evaluations, agencies should seek partnerships with external or academic researchers who are vested in similar questions.

Randomized evaluations can only occur when randomization is built into the program design. However, randomization should not be incorporated indiscriminately; rather, randomization should be incorporated into programs to facilitate randomized evaluations where appropriate on three grounds:

- The current evidence for answering the well-defined research question is non-existent, insufficient, or inconclusive.
- There is a clear unit of randomization—individual program participants, schools, clinics, etc.—for which there is a large enough sample size and a clear means of tracking outcomes for both the treatment group and the control group.
- Randomization is feasible and ethical. Although not an exhaustive list, the following conditions offer opportunities where randomization may be feasible and ethical:
    - Demand for a program exceeds capacity to provide the program. A lottery may be a fairer alternative than allocating slots on a first come, first served basis—particularly when a goal of the program is equity of access—and offers an alternative to imposing increasingly narrow eligibility criteria under funding constraints.

---

[18] Social and Behavioral Sciences Team. *2016 Annual Report*. Executive Office of the President, National Science and Technology Council. September 15, 2016. https://sbst.gov/assets/files/2016%20SBST%20Annual%20Report.pdf

- o A program is being expanded by gradually offering it to individuals, schools, or districts until full coverage is reached. A lottery can be used to randomly assign the order in which individuals or units receive the program. The individuals or units that have not yet received the program serve as the control group until all units receive the program.
- o A new intervention—such as a financial incentive or care coordination services— will be added to an existing program. Program participants can be randomized to receive different versions of the program, e.g., with or without the added intervention, to isolate the impact of the new intervention.
- o Program eligibility criteria are being refined or reconsidered. People just above/below the eligibility cutoff can be randomly assigned to receive or not receive the program to determine whether it is effective for this marginal group. Meanwhile, those well within the program eligibility cutoff, automatically receive the program, and those well outside the cutoff do not qualify for the program.

As a specific example of institutionalizing a randomized evaluation, the South Carolina Department of Health and Human Services is partnering with J-PAL North America to incorporate a randomized evaluation in its expansion of a nurse home-visiting program for low-income mothers delivered by the nonprofit organization Nurse-Family Partnership (NFP). The specific, high-priority research question is whether a new, less expensive version of the NFP program that South Carolina is expanding will be as effective as the pre-existing version that has been rigorously evaluated before.

A randomized evaluation was found to be an appropriate method for answering this question given excess demand for the program. Although South Carolina is expanding this less expensive version of NFP to thousands of mothers through an innovative pay-for-success initiative, the program does not have sufficient resources to serve all of the women who are eligible. Applicants will be randomly assigned, on a rolling basis from 2016 to 2020, to either a treatment group that is offered access to the program, or to a control group that is not.[19] We will assess the effect of NFP on a range of short- and long-run maternal and child outcomes using administrative data that will be available for all members of both treatment and control groups. This will yield useful evidence for South Carolina and for policy makers nationally, who are interested in the broader health and financial consequences of expanding Medicaid to include similar services.

Date: December 22, 2016

To: Commission on Evidence-Based Policymaking

From: Tom Schenk Jr, Chief Data Officer, City of Chicago

RE: Input on CEBP mission as defined in Public Law 114-140

Data privacy is crucial so Americans can trust the systems they rely upon for their well-being. People must have full faith in the ability to talk to their doctors, knowing that their details will not be reassociated with them again; students and parents must have faith that their grades, disciplinary records are only made to select few; and every member of the household must have faith that their responses to Census records will not be shared widely until many decades later.

Those protections should not inhibit their government from providing better, more comprehensive services. The whole sum of social sciences research has demonstrated that outcomes in health, education, well-being and other areas are highly dependent on outside factors, such as nutrition, education levels of parents and guardians, family wealth, and many other factors. Often, researchers and policymakers need to account for external factors, such as these, to help understand program effectiveness.

Enabling evidence-based, data-driven policy is crucial for governments to be more efficient and effective for Americans. This is a progression of many steps where the bipartisan coalitions in U.S. Congress and the President have made several large steps to enabling greater data sharing with the explicit goal of improving education, workforce outcomes, health, and human services. The *America COMPETES Act of 2007* and subsequent *American Recovery and Reinvestment Act* provided the targets and funding, respectively, to allow state governments to build longitudinal data systems which facilitate the ability to track students from the school system into the workforce. The recent authorization of *Workforce Innovation and Opportunity Act* (WIOA) has extended the call for linked data between education and the workforce to help job seekers.

The impact of these bills have been useful at every level of government. While heading institutional effectiveness and accountability for the Iowa Department of Education, we were able to use these longitudinal systems to conduct sophisticated analysis of the effectiveness of state-funded programs. Our team was able to calculate comprehensive rates of return to education for community colleges by each individual program for each individual college. By combining those records with state prison records, we could also determine the amount of diversion of costs by reducing the likelihood of crime. We could also determine the additional

tax revenues the state earned by those student's higher wages and lower expenses on other support programs.

Other research included sophisticated pseudo-experimental evaluations of science, technology, engineering, and mathematics (STEM) programs. These studies used sophisticated analytical techniques to follow students from middle school, through high school, and into college to judge the ability of programs to increase math and science test scores, improve high school graduation, articulation to college, and the entry into STEM college majors.

As a senior researcher with the Department of Medical Social Sciences at Northwestern Feinberg School of Medicine, we used linked patient records to understand the long-term impact of cancer interventions on not only the progression of cancer, but also the quality of life for cancer patients. And today, as Chief Data Officer for the City of Chicago, we link multiple data sources together to predict where to send food inspectors, the next outbreak of rodents, and to allocate our workforce to pro-actively

The task set for the CEBP is also enormous. If privacy is compromised or if we are unable to effectively link data to drive better decisions, it could setback progress on evidence-based policy. Based on my conversations with hundreds of residents on how governments use data, I have found that Americans are happy when this data is being used to improve lives and to make their government more efficient. However, we also know this optimism can be undermined by unethical uses of data or disclosing personal details of an individual. It is a careful balancing act that can be achieved, but takes considerable thought and attention.

II. Clearinghouse

One task laid out for CEBP is to "consider whether a clearinghouse for program and survey data should be established and how to create such a clearinghouse". Single clearinghouses of data are often too big and too complicated of a task to be done well. We all have ideals of a single large repositories of all data that can be used by every researcher. However, we must take rational first steps and focus on "quick wins". Attempts at creating websites for everyone often leads to creating something too confusing and ultimately not useful for anyone.

Instead, a two-pronged approach should be taken for the Commission to meet its target by creating smaller, linked hubs and to create a service to allow for *ad hoc* data matching.

A. Setup smaller "hubs" as initial steps to clearinghouse

In order to provide a tractable mission for CEBP, the organization must focus on data matching problems to help answer specific domains of policy questions. For instance, congress has passed several pieces of legislation focused on linking education and workforce outcomes. There are

clear outcomes that can be measured through these linked records. The initial hubs should focus on the highest priority questions, incorporating the most critical sources of data.

Additional hubs should be created to explore topics such as recidivism, health care, impacts of poverty, and other areas deemed of high importance. As new legislation is passed, Congress and the respective departments can continue to integrate data into these hubs so outcomes under the legislation can be effectively tracked and new research questions can be explored.

These hubs should continue to grow, but with a goal of eventually becoming interoperable themselves. This approach can help ensure that researchers get access to valuable data earlier while continuing to progress

B. A service to link data and remove unique identifiers should be provided for researchers

Researchers need access to a variety of linked data but while balancing privacy. One way to achieve this is to create a centralized service which empower teams whose responsibility is to match personally identifiable data for the purpose of research and then discard personally identifiable data before it is provided to researchers.

Of course, other data besides unique identifiers can compromise privacy. A unique combination of data—such as gender combined with age, race, and ethnicity—could allow someone to tie seemly anonymous data back to individuals. For instance, there may be a lone 32 year-old female immigrant in a ZIP code, so the release of that data could undermine privacy. Further steps on imputation, sometimes called "hot deck imputation", are needed to mask personally identifiable data.

The United Kingdom's Data Services—operated by the UK's Economic and Social Research Council (ESRC), an organization akin to the United States' National Science Foundation—provides similar services. The State of Florida's Integrated Network for Data Exchange and Retrieval (FINDER) has also set a benchmark for such services.

There should also be efforts to capitalize on the existing open data movement. Federal government agencies and hundreds of state and local governments have launched open data portals which make data easily accessible without any barriers. Linked data—at its most summary level—would be a great addition to open data portals.

III. Barriers to data exchange

A. Data needs to be exchanged between levels of government

Policymakers are sometimes surprised to find their respective government does not have all of the data relevant to their operations. In contrast to wide belief, the federal government does not have access to all of the data available for local and state agencies. There are significant and legal barriers that prohibit governments and agencies to sharing data between levels of government.

Congress and government agencies can take steps to facilitate data sharing between localities and states, between states, and between Federal governments and other government agencies. For instance, WIOA requires the tracking of educational outcomes even though states are unable to track those outcomes—such as wages and state certifications—in nearby states. Legislation should encourage, if not require, these data sharing exchanges to facilitate research studies.

B. Guidance on existing privacy laws

Some of the limited ability to share data is simply caused by misunderstanding privacy laws, perceiving or misinterpretation an inability to share data when it is possible. There will always be value in providing further guidance for governments to clarify permissible data sharing between departments and governments.

IV. Limitations on data usage

These new ideas must also evolve our notions of ethical uses of data. Currently, legislation exists on whether some can or cannot *have* data. A future clearinghouse, hubs, and robust linked data needs to consider how data is allowed to be *used*.

Further guidance will need to clarify ethical and unethical uses of data, which should extend to whether researchers would be permitted to access and use linked data. Violating these terms should remove the researcher's ability to be able to access linked data in the future.

V. Making research relevant and useful for policymakers

Research must be relevant to policymakers that answers their immediate questions and also be able to foresee other valuable research questions. A crucial aspect of relevant research is geographical relevance. National studies can indicate important trends, but often are not representative of each state or city or every participant. Research should be prioritized if it provides geographic breakdowns, breakdowns by subgroups, and other subsets deemed important for programs.

These summary statistics are incredibly useful for policymakers and should be frequently published. When data systems to talk with each other, agencies should still issue the reports that

take technical details and summarize high-level statistics. These statistics should also be downloadable.

Researchers should be encouraged to improve their communication channels for policymakers. They should rely on recent developments in data visualization research and issue short-form abstracts to quickly communicate findings and become less reliant on long-form journal articles and reports.

VI. Rigorous impact analysis

Randomized control studies have been considered the "gold standard" of evidence-based policy. However, these studies are not always possible because of logistical constraints, ethical concerns, or would be too narrow to represent overall performance of a program. Meanwhile, other sophisticated techniques, such as pseudo-experimental methods like propensity score matching, difference-in-difference, and other methods can be used to measure causal impact of programs. The framework on evaluation should consider the "gold standard", but also a "silver" and "bronze" standard of rigor.

Timothy F. Slaper, Ph.D.

Research Director
Indiana Business Research Center
Kelley School of Business
Indiana University

Abstract:

We at the IBRC support the Evidence-based Policymaking initiative. We strive to disseminate actionable, geographically relevant data to the public at no cost to the user to facilitate research and decision making at the local, regional, state and federal levels.

Place is primary in such work. The goals and objectives of the initiative and the Commission will be undermined if insufficient attention and effort are made to ensure that the spatial dimension of data, and the activities and agents those data represent, are not a primary focus for data collection, data identification, data integration and data application.

Place determines one's experience and often who one is and how one has developed. Any discussion about developing evidence for effective actions needs to have a common geographic language and precise definitions. As many have already testified or alluded to, integrating data from multiple agencies is critical for making an argument for which policies are effective and which are not. To this end, a national data clearinghouse has been proposed to provide one stop shopping for researchers and policy makers. Before any one-stop data shop can be implemented, all agencies within the national statistical infrastructure as well as all data collection and reporting agencies across all states must use a common and consistent set of geographic definitions and identifiers.

Written Statement:

Chairman Abraham, Co-Chair Haskins, and commissioners: I applaud the work you are doing to realize the vision of evidence-base policymaking. Thank you for the opportunity to address the Commission.

I am Timothy Slaper, the research director at the Indiana Business Research Center at Indiana University. Our center, over 90 years, is attached to the Kelley School of Business and was initially a data, analysis and research resource for businesses in the state. Over time, our mission has broadened to include public policy-related research and analysis in workforce development, occupational analysis, educational performance, demographic projections, local government finance, economic development and innovation, to name a few. It has also broadened in terms of geography as well. We now provide economic and demographic statistics for the entire nation and conduct research on regional development relevant to all areas in the United States.

Under the auspices of the State Library, the IBRC serves as the state data center. Our chief information officer has served as an advisory to many BLS and Census projects, including the Data Quality Initiative. The State Demographer works in our center and participates in Census collaborative programs. We know data. In fact, our databases currently have over 6 billion data items from every major statistical

agency in the federal statistical infrastructure as well as Indiana state-specific data from multiple state agencies.

If you were to google "U.S statistics," our website StatsAmerica.org would be listed in the top ten websites. This website is sponsored by the Economic Development Administration as a portal for several of their tools and resources and as a one-stop shop for many of the data reported by federal statistical agencies, primarily BEA, BLS and Census. The website also hosts the Innovation Index, a data resource for economic development practitioners to assess their county or region's strengths and weaknesses and make interregional comparisons. The Innovation Index 2.0 uses county-level data from BEA, BLS, Census, FCC, NCES, and NSF, among others.

Capturing and aligning the data for use in the index should have been mildly challenging, but it was not. It was massively challenging because there is no consistent or common geographic definition for a county over time, or, for that matter, for a single year. Having to deal with a shifting landscape of geographic definitions delayed the Innovation Index project nearly 18 months. Putting the county-seat holes back in the surrounding Virginia county doughnuts, as one must do with Census data to make it conceptually consistent with counties elsewhere, is one thing – not that hard – but having agencies like NCES with legacy issues in terms of geographic definitions that are not aligned with current Census definitions is exasperating.

I mentioned my frustration to a colleague who at one time sat as an advisor to Census. When he served in that capacity, people would mention the need to harmonize geographic definitions across statistical agencies and there would be universal nodding and agreement that it would be good to do so. Trouble is, phones would ring in Congressional offices. Data vendors, those who make money aggregating federal data and selling it to local and state governments, businesses and advocacy groups would complain to members that such a thing would hurt their business, and the idea would die.

Considering the importance of location in understanding the impact of policies, and considering the primacy of having consistent geographic definitions in order to integrate the data – the latter being something the IBRC knows plenty about – you need to tell members of Congress to expect a few phone calls in opposition to an integrated national data clearinghouse.

Many others who have already testified have done an excellent job explaining their support and making suggestions about how to implement the changes needed to actualize evidence-based policymaking. My contribution would pale in comparison.

I do want to emphasize the importance of place, of location. Everything happens in space and only rarely are two spaces alike. National goals for, say, graduation rates for at-risk youth are fine, but Baltimore is not Houston. Baltimore has its unique history and set of challenges relative to Houston. A 5 percent increase in graduation rates in Baltimore can't be compared to the same percentage point gain in Houston based on one policy intervention.

Many of you work and reside in Washington DC, or travel there extensively. Please don't allow a federal or national perspective to give short shrift to the primacy of place.

If I may close with a quick story. On December 21, my son asked me if "today" is the longest day of the year. Another son corrected him, "No, it's the shortest." "Not in Australia!" the first son corrected. Place matters.

Commission on Evidence-Based Policymaking

Using Evidence to Improve Programs and Inform Policy Decisions

Matthew Stagner, Senior Fellow
Mathematica Policy Research
January 5, 2017

For nearly 50 years, Mathematica has been dedicated to delivering high quality evidence and objective analysis to help policymakers and public program leaders uphold their missions to improve public well-being. As senior fellow and director of human services research in Mathematica's Chicago office, I want to thank you for the opportunity to contribute to the important work of the Commission with my testimony today.

Earlier this month, Mathematica President Paul Decker emphasized the importance of evidence-based policymaking in a letter submitted during the Commission's open comment period. Today, I will underscore several of Paul's key points while also highlighting my own experience in evaluating policies and programs for vulnerable youth and at-risk families. I will focus my comments today on:

- Effectively translating research evidence into actionable policy changes and program improvements
- Expanding access to administrative data in support of that research
- Ensuring that evidence used in policymaking is rigorous

I begin by highlighting how research can, and should, be translated into actionable policy changes and program improvements. I have seen this happen firsthand. For example, Mathematica is working with the U.S. Department of Health and Human Services, Office of Adolescent Health to expand the use and understanding of evidence-based programs to prevent teen pregnancy. Over the years, we have identified dozens of these programs that have demonstrated evidence of success in reducing sexual risk behaviors among adolescents. This is important because the federal government has invested millions of dollars to disseminate

knowledge about these programs and to implement and evaluate them in communities around the country. Currently, we are designing new evaluations of teen pregnancy and other risk prevention programs that build on this growing portfolio of research.

In work we are doing for the Administration for Children and Families (ACF), we are studying interventions designed to help former foster children who are at risk of homelessness and face significant challenges in the transition to adulthood. We provided evaluation technical assistance to state and local grantees as they developed comprehensive and innovative programs to support at-risk youth in making a successful transition to independent adult life. This project is helping strengthen these grantees' interventions and evaluation plans, build their local evaluation capacity, assess the evaluability of their programs, and document the progress they make during the planning period. It also provides insight into potential designs and implementation of broader programs intended to reduce homelessness among former foster youth. A key lesson from this is that building evidence can take significant upfront work with programs to make sure we evaluate approaches that are innovative, well implemented, and significantly different from existing services.

Also for ACF, Mathematica is evaluating the effectiveness of maternal, infant, and early childhood home visiting programs, which are designed to achieve better outcomes for mothers, fathers, and their babies. Adverse birth outcomes, such as low birth weight and preterm birth, are more common in the United States than in other developed countries, and they extract emotional and economic costs from families and communities. Our studies are providing evidence on which programs are effective in improving children's health and development, as well as other outcomes.

Conducting this work effectively, however, requires expanded access to sophisticated administrative data. For child welfare agencies in particular, the ability to link administrative data across systems and apply them to decision making can have a real impact on vulnerable children and families. Although administrative data give agencies the ability to inform program development and improve outcomes, expanded access comes with challenges, such as maintaining confidentiality and understanding the meaning and usefulness of data in the various human services systems. Learning to use these data effectively and efficiently requires expert guidance from state and local leaders who specialize in data systems, policy, and practice.

In one project for Casey Family Programs, we are examining administrative data in two states to identify children and youth who are heavy users of child welfare, Medicaid, and other services. Identifying subpopulations of children and youth who are continuously using intensive

services may shed light on those who lack support at critical junctures, are placed in overly restrictive environments, receive too many ineffective services, or are in need of better and different ways to meet their extensive needs. We expect this project to help child welfare and allied agencies achieve better outcomes for youth and families by tailoring more effective services to them earlier. We also expect that our findings will demonstrate the need for service coordination across systems to identify better strategies to serve these children.

Our project team has encountered some barriers in accessing the data, however. First, we live in a world of decentralized data, where each state or county collects and stores data in a different way. This leads to the need for many months of work to understand each data set, what it can provide for analysis, and what may be missing or inaccurate. Second, the privacy protection laws—important for preventing the misuse of information—can create long delays in access for legitimate policy research. We should seek ways to standardize data across jurisdictions, while allowing for some state flexibility, and also find ways to fast-track policy research requests while continuing to protect privacy.

Evidence used in policymaking must be rigorous, using a strong research methodology and starting with a carefully designed research question. I also support Paul's view that too often, policy is made using subjective judgment or poorly designed research. While randomized controlled trials (RCTs) are the "gold standard" of research methodology, high quality research can also encompass a wide range of research methods. Program managers seeking to refine a program may use descriptive or non-experimental analyses that help generate hypotheses about what is working and what is not. They may also use machine-learning methods and big data to predict which services might be most effective for each program participant based on his or her characteristics and needs. These managers could then propose changes to their program and evaluate these changes using an RCT or a quasi-experimental design (QED) before deciding to roll out the change widely.

For another ACF project, I am working with a team of researchers to explore the potential of advanced research methods and data to address unanswered questions about the incidence of child maltreatment. Although research on child maltreatment has advanced substantially over the past 20 years, new data and innovative research tools make it possible to better understand the incidence of maltreatment and related risks and, in turn, to improve practices and policies. Our findings will inform the direction of future research. We will draw on existing administrative data, innovative methods, and advanced statistical techniques by identifying and prioritizing key research questions and exploring innovative methodological approaches. In each design option, we will discuss primary research questions; describe how to access, use, and link relevant data

sources; identify relevant survey items and statistical analysis plans; pre-test instruments; estimate statistical power, respondent burden, and needed resources; and discuss the barriers, challenges, and feasibility.

The common thread running through all of the points and examples cited above is the importance of strengthening partnerships between the research community and the public policy and program communities. Working together more effectively and efficiently will help us achieve our shared mission to improve public well-being. Researchers can provide critical insights at all stages of policy and program design and improvement. In the same vein, government agency staff can be important partners throughout the research process by contributing vital perspectives on identifying and implementing evaluations and providing access to key data.

Fostering a culture of evidence throughout our federal, state, and local governments is essential to ensuring that policies and programs are developed and refined to meet the needs of our fellow citizens. I am honored to be able to present this testimony to the Commission today, and we at Mathematica look forward to following the Commission's work in the months ahead. I am happy to respond to any questions about my remarks today. Thank you.

University of Kansas
and
Research Associate
National Bureau of Economic Research

Commission on Evidence-Based Policy Making

February 10, 2017

Introduction

Chair Abraham, Chair Haskins, and distinguished members of the Commission, you asked me to address questions based on my previous testimony. My response is detailed below. I conclude with a discussion of logistical hurdles associated with access to these confidential data and a suggestion for how to provide access while maintaining confidentiality.

1. What are specific, actionable recommendations for how policymakers can be incentivized to encourage evidence-based policymaking?

This is a very hard problem. As I mentioned in my testimony, no bureaucrat has ever lost his or her job by saying "no" to a researcher request. Furthermore, policy-makers at the highest levels of federal agencies need to advocate for evidence-based policy. Essentially, evidence-based policy clashes with typical management decisions because a policy-maker needs to be willing to risk learning about bad outcomes. To fully take advantage of evidence-based policy,

the federal government needs to promote a culture of learning from evidence. Policies should be

implemented that do not punish policy-makers and administrators for revealing "bad news"

about a given program. Models of these types of changes can be found in evidence-based

medicine and evidence-based management. Jeffrey Pfeffer and Robert Sutton tackled the

challenges confronting managers and policy-makers in their book, *Hard Facts, Dangerous Half-*

Truths And Total Nonsense: Profiting From Evidence-Based Management. My

recommendations are based in part on their research.

First, evidence-based policy requires evidence. <u>The federal government should provide</u>

<u>funding for evidence-based research via the NIH and NSF</u>. The Science of Science and

Innovation Policy (SciSIP) at NSF provides a good model for how science agencies could fund

evidence-based policy research. SciSIP was created in response to John Marburger's call for

using evidence-based policy to understand the economic impact of the federal government's

scientific investments.   The science agencies have existing infrastructure that can be used to

facilitate evidence-based policy. For example, federal research funding could be used to support

the use of the data clearinghouse. In addition, the peer review process at the funding agencies

can be used to identify qualified researchers and projects.   The non-science federal agencies

should be allocated funds for the evaluation of their programs and have periodic reviews of their

programs in order to facilitate improved outcomes of federal investments. These programmatic

reviews should be conducted by individuals outside of the agency (for example, researchers who

have had their projects peer-reviewed) in order to provide an unbiased assessment of the

program.

Second, policy-makers in the federal government's Senior Executive Services (SES) need training and professional development in evidence-based policy and management.   According to Pfeffer and Sutton, "The Centre for Evidence-Based Medicine says that identifying and applying effective strategies for lifelong learning are the keys to making this happen for physicians. The same things are surely critical to evidence-based management."[1] The Office of Personnel Management offers several executive development courses for members of the SES including formal training, mentoring and executive coaching. The curriculum could be expanded to provide courses about using evidence in decision-making, an overview of research methods associated with evidence-based policy, and how to assess the quality of research studies that inform evidence-based policy.

Third, as evidence-based policy evaluations are put in place, a "negative outcomes" reporting system should be developed to facilitate learning from the unintended consequences of various policy initiatives. To incentivize admissions of "negative outcomes," policy-makers that report these unintended consequences would be held harmless as long as they take proactive measures to address policy shortcomings that they have identified. This system could be modeled on medical models of patient safety reports or the Aviation Safety Reporting System. The goal of a reporting system would be encourage the admission of negative outcomes and limit assigning blame. Using "negative outcomes" as additional evidence, policy-makers could then recalibrate policies with the goal of improving outcomes.

Finally, the federal government should encourage and fund experiments and prototypes before making wholesale policy changes. Although controversial, the Affordable Care Act (ACA) provides a good example of how this might work. The ACA was based on

---

[1] *Harvard Business Review***,** January 2006 https://hbr.org/2006/01/evidence-based-management**.**

Massachusetts' universal health insurance law that was enacted in 2006 and the Oregon

Medicaid expansion lottery. The evidence from these state policies informed the implementation

of the ACA. Although no policy is perfect, the ACA has provided health insurance coverage for

over 18 million, previously uninsured people. As Congress debates changes to the ACA, an

evidence-based approach would slow the process of changing the program in order to experiment

with changes for the purpose of developing evidence on what works and what does not. For

example, states could be granted waivers to experiment with changes to the ACA. After three to

five years, the evidence associated with these state waivers will accumulate to show how the

ACA can be improved prior to making wholesale changes to national policy.

2. What other datasets, if any, would facilitate your work that are not currently accessible

    to you?

The federal and state governments collect terabytes of data that would be useful for my

research purposes. In general, I am in complete agreement with Commissioner Troske's

argument that if the federal government funds the collection of administrative data, then these

data sets should be part of the data clearinghouse. Below I list data that would facilitate my

work. While I have had limited access to some of these data sets, broader access would further

future research and evaluation for me and may others.

First, I recommend that the commission prioritize the creation of unique Protected

Identification Keys (PIKs) for all survey and administrative data that are included in the data

clearinghouse. Since almost all of my research and evaluation depends on linking individuals

that appear in several data sets, this would facilitate improved research and evaluation. Specific

data by research subject include:

K-12 Education and Social Safety Net Data

- The U.S. Department of Education funded the creation of the Kansas Individual Data on Students (KIDS), a student longitudinal data system (SLDS). These SLDS data for all states should be available to the federal government and researchers.

- Administrative records on state and federal social safety net programs could be linked to student records. Linking these data to student records would allow researchers and policy makers to understand the impact of social safety net policies on child's educational outcomes. These include administrative records for:

  - Temporary Assistance to Needy Families (TANF)

  - Supplemental Nutrition Assistance Program (SNAP)

  - Earned Income Tax Credit (EITC)

  - Women, Infants and Children nutrition (WIC)

  - Supplemental Security Income (SSI)

  - Head Start and other Pre-K program participation records

  - Medicaid Records

  - Childcare assistance records

  - Federal housing applications, support and vouchers.

- The ability to link employment records of parents from the LEHD and child support payments to student records in SLDS would allow researchers to understand the effect of income on child outcomes.

Higher Education Data

- Student administrative records from systems of higher education (e.g. the Kansas Board of Regents).   These data could be linked to the LEHD to understand the economic return to investments in higher education.   The University of Michigan Institute for Research on Innovation and Science (IRIS) has these records for about 20 universities. Having this information for federally funded colleges and universities would facilitate a deeper understanding of the private returns on the education investment as well as the impact of federal funding of graduate training in science and engineering.

Science Policy Data

The scientific agencies have a treasure-trove of administrative data that would facilitate the science of science policy studies. These data include:

- NIH IMPAC II extramural funding applications and awards data. It would be useful to create the ability to link principal investigator IDs to their publications in PUBMED.

- NSF Enterprise Information system data on applications and awards.

- Similar grant administration data from the Department of Defense, Department of Agriculture and Environmental Protection Agency

- Data from SciENcv: Science Experts Network Curriculum Vitae and My Bibliography from the National Center for Biotechnology Information.

- Information from iEdison that links patents to federal funding.

- A crosswalk that links scientists to their federal research funding IDs to publication record IDs such as Clarivate Analytics Researcher ID or ORCID.

- A crosswalk that links institutional IDs in federal funding research databases (e.g. the ID

6

for the University of Kansas in NIH IMPAC II) to the Department of Education's

Integrated Postsecondary Education Data System.

- Information on state of residence and employer industry in the Science and Engineering

   Statistics Data System.

Internal Revenue and Social Security Earnings Records

- The ability to link Internal Revenue W-2 records and Social Security Administration

   disability and retirement records to federal survey data including the American

   Community Survey, Current Population Survey and Survey of Income and Program

   Participation data would facilitate improved estimates of labor market outcomes.

3. Logistical issues Associated with Access to these data.

Although the Commission did not ask me to comment on access to administrative data,

this is a pressing issue, and I would like to share my experiences. The Commission would like to

preserve the privacy and confidentiality of these administrative records. However, we have

encountered significant problems with existing models of confidential data access. The Research

Data Center (RDC) network has regularly experienced severe connectivity issues with accessing

data housed at the Census Bureau. These include losing access to Census data for hours or an

entire day as well as problems with password resets and security questions. In the programming

environment, large programming jobs can shut down an entire RDC. There is no plan to expand

the number of computing nodes at Census headquarters despite the addition of six RDCs this

year.   Thus, the RDC model as it currently exists would be over-burdened by the additional

demands of supporting a data clearinghouse.

One alternative to the RDC model is the NORC Data Enclave—a kind of private version of the RDC that allows researchers to connect to data secured at NORC via VPNs and secure laptops. Although this method provides more flexibility than the RDC, it is plagued by slow response to user requests and an inability for researchers to easily upload programs or data to the secure system.

One promising alternative would be to create a series of synthetic databases that could be used for research development purposes. Once researchers are satisfied with their analysis on the synthetic data, they could send their analytical files to Census or the Data Clearinghouse for validation on the internal data. A version of synthetic Survey of Income and Program Participation (SIPP) data matched to IRS and SSA records is now available (http://www.census.gov/programs-surveys/sipp/guidance/sipp-synthetic-beta-data-product.html).

Conclusion

Once again, I would like to thank the Commission for allowing me to testify about evidence-based policy. Researchers' access to administrative data has the potential to revolutionize policymaking and improve the functioning of all levels of government.

Hotz -- QFR's

- In your written testimony, you urged the Commission to investigate the various laws and regulations governing access to administrative records for research purposes. What are some specific examples of cases where Federal or state law or ambiguity around Federal or state law can be a barrier to accessing data?

The basis for my comments, as noted in a footnote in my testimony, is an National Research Council report, *Reengineering the Survey of Income and Program Participation*, edited by Constance Citro and John Karl Scholz. I attach a copy of this Report. I was a member of the NRC Expert Panel that produced this Report. The section of the report relevant for the Commission's question to me is Chapter 3, "Expanded Use of Administrative Records," pp. 58-64 in particular. This section addresses the following question:

> If you wanted to link state records for social programs, e.g., TANF, Medicaid, UI, Workers' Compensation (WC), and other case benefits, to a Census Bureau data set like the SIPP, are there legal barriers to Census acquiring these data?

To answer this question, the Panel commissioned a study by Professor Douglas J. Sylvester, who is the dean of the Sandra Day O'Connor College of Law at Arizona State University. I attach a copy of his final report on his findings. The pages noted above in the attached NRC report summarize his findings. Sylvester focused his analysis on 3 categories of state laws, constitutions and judicial rulings concerning confidentiality and access provisions that applied to 4 "sets" of programs (TANF, Medicaid, UI & WC, & other Cash Benefits) for each of the 50 states, giving a total of 200 = 50 x 4 state-programs. The 3 categories were: 1. Ready Access; 2. Restricted Access; 3. No Access. (See p. 59 of the NRC report for definitions and Table 3-1 on pp. 60-62 for the summary results.) **The Sylvester study concluded that 113 of the state-programs fell in Category 3 of No Access**. This finding is the basis for the comment I made in my testimony that the Commission has noted.

There are a host of qualifications to the above conclusion about access to state administrative records. Many are made in both the NRC report (pp. 63-64) and in the Sylvester final report. One of them is that the analysis undertaken by Professor Sylvester was not asked to examine provisions in federal law (see p. 3/22 in the Sylvester report) and I have nothing more I can say with any authority about the federal laws and titles that apply to this issue, beyond what the Commission already knows about such laws as CIPSEA, HIPAA, FERPA and the titles that govern statistical agencies like Census and the IRS. But I would draw the Commission's attention to pp. 18/22 of the Sylvester Report concerning the SSA Access to State Records Online (SASRO) operation that provides SSA to access to state-held records for various state-level programs like TANF, Medicaid and others. As I understand it, SASRO is a data-sharing program is for the purposes of the administration of SSA programs; I don't know that it covers uses "for research purposes."

Also, Sylvester notes on p. 18/22, several federal regulations (20 C.F.R. 401.110) apply to the sharing of data between SSA and the Census Bureau for "purposes of planning or carrying out of a census or survey or related activity…" Again, I don't have sufficient expertise to say anything

more about these provisions in federal statutes about data sharing, but I note them as potential federal provisions that seem relevant to the issue at hand.

- What datasets do you think are most vital for research and as such should be included in a federal data clearinghouse if the Commission were to recommend one be developed?

My preferences would be for the following data and administrative records to be included:

(1) SSA Master Earnings File and Benefits Files for all of the programs it administers (OASDI, SSI, etc.)
(2) IRS Records on Earnings, claiming for EITC and college attendance
(3) TANF and General Assistance from states, including non-cash benefits (e.g., child care and training)
(4) SNAP, WIC, CSFP and other food/nutrition programs
(5) Section 8 and other housing programs, including Low Income Home Energy Assistance
(6) Medicare and Medicaid (presumably from CMS) and SCHIP
(7) Child care (Head Start) and other programs
(8) UI and Worker's Compensation Records (from state)
(9) Death records

I also think that attention needs to be paid to getting other sources of data, including non-federal data that can be linked either to governmental admin records or surveys. These include:

(10) Credit Score data
(11) Student Debt (federal guaranteed and non-guaranteed)
(12) Housing data on housing values, foreclosures, etc.
(13) Health data, such as from Electronic Health Records from health care provider systems
(14) Place-based data like neighborhood crime data, access to food outlets by quality (e.g., food deserts and swamps) and access to other vital services (heath care facilities), "neighborhood walkability". The key for these data is being able to link it with to admin records of individuals and/or survey respondents by location.

These data are needed to assess the impacts and effectiveness of various federal (and state) policies.

I will stop here. Let me know if there is more you want on this issue.

TO: **Commission on Evidence-Based Policymaking**
FROM: **Virginia Knox, PhD**
                MDRC, Director of Policy Area on Family Well-being and Children's
                Development
RE: **Response to follow-up questions**
DATE: **February 10, 2017**

Thank you for the opportunity to provide additional input for the Commission's consideration. My responses are aimed at acknowledging the solid foundation that Congress has built for evidence-based policymaking and to indicate the most critical elements to include in future legislation. The discussion below draws on MDRC's forty-plus years of working with a variety of federal agencies to learn what works to improve the well-being of low-income individuals and families.

- **What specific, actionable recommendations do you have for the Commission related to building a culture of continuous improvement and building on tiered evidence strategies employed at ED, HHS, and Labor? What resources would be most helpful to agencies?**

Congress has already begun to build a culture of continuous improvement and to expect agencies to rely on evidence to make funding decisions. Therefore, some of the most actionable recommendations are a continuation of current trends in legislation that has used tiered evidence approaches, such as the Education Innovation and Research program that was created through the Every Student Succeeds Act. Congress can support evidence-based policymaking by clearly stating that:

a) Independent evaluations of programs and policies in the federal government are critical to making informed decisions about how federal resources are spent. This includes building a body of evidence over time that is aimed at informing high priority questions about the most efficient and effective allocation of public resources and design of policies and programs.

b) In fields where there is a rigorous evidence base upon which to make funding decisions, the majority of federal funds should be used for policies and programs that have evidence of effectiveness. Where there is not an adequate evidence base, or where there are important gaps in the evidence base, federal funds should be accompanied by evaluation requirements so that a base of evidence is built to inform future decision-making.

c) Even in fields that have a substantial base of evidence, federal funds can provide incentives for continual improvement and innovation to address newly emerging issues, by allowing a proportion of federal funds to be used for promising programs that need more research to determine their effectiveness.

d) Rigorous evaluation should be used to assess the impacts, benefits, and costs of policies and programs.

e) Evaluations should aim to not just measure current program effects but also to inform future improvement and decision-making. This can be done through research designs aimed at learning from variation in impacts where possible and by including implementation studies that examine issues such as the fidelity of programs to the intended policies or program models; local innovations and adaptations; the infrastructure needed to scale up the policy or program; and the mechanisms by which the program has its effects.

f) The tiered evidence strategy described above can be applied to existing funding streams by using the above principals and setting aside funding for research and evaluation. ESSA's provisions that reformed Title I are an example of movement in this direction. Other funding streams have also used research set-asides to help build a body of evidence that accumulates and provides newly needed information over time. These are typically 1% or more, depending on the size of the funding stream and the state of evidence in the particular field. Set-asides should preferably be structured so that the programs and the research that can improve their effectiveness over time are not put in the position of competing with each other for scarce public resources.

Evaluations using these set-asides can play several critical functions, including understanding the effects of *new* policies or programs; providing data-driven guidance about how to improve *existing* policies and programs over time; and to *refresh the evidence base* for programs in which the social and economic context has evolved since the original research was conducted.

- **Can you provide examples of where the "special rights clause" was used to limit the public release of the results of a program evaluation?**

In our experience, use of the special rights clause hampers efficient and effective evaluation. Federal contracting provisions governing data ownership establish the agency/contractor relationship in evaluation research, specifically how both quality control and independence are

maintained. Federal agencies have several options to strike the appropriate balance between the need for accountability on the part of the government and the need for independence on the part of the social policy evaluator. Use of the special rights clause (52.227-17) is an exercise of governmental control that undermines any claim to independence that is vital for social program evaluation credibility.

In our experience, it is usual for agencies to claim that its rights over the content and dissemination of reports derive from the special data rights provision. This provision prohibits the contractor from using, releasing and publishing any data produced during contract performance without prior written permission of the contracting officer. The provision, according to which government is given unlimited rights to all data, including copyright and release, is associated with restrictive governmental control over the contractor's work products: line editing and writing of reports prepared by the contractor; delays in the release of findings to accommodate politically-motivated review; the ability to forbid release; and, the assertion of total control by the government over individually identifiable survey and administrative data that the contractor is collecting as part of its impact analysis. However, this exercise of governmental control undermines the independence and transparency that is vital for social program evaluation credibility. And it is contrary to the purpose of the special rights clause, which is to govern the production of data for the *internal use* of government.

Further, the clause's severe restriction on publication raises major issues for work with universities, which hold academic freedom principles that do allow work on federal contracts including the special rights clause. We have witnessed considerable inefficiencies in the use of federal resources for evaluation because universities who would have been the highest quality or lowest cost partners in a federal contract were unable to sign a subcontract that includes this provision. This has led to delays or increased management costs in two different ways: We have held protracted discussions about mitigating the effects of this clause so that the university is able to be part of the research team, or the university partner has simply had to leave the planned team and we have had to spend time and resources identifying other partners.

There is a solution to this problem. The general rights in data clause contains "alternate provisions" that are mandated in contracts for basic and applied research with universities or colleges and are permitted in other contracts upon agency determination that the alternate provision is appropriate. Federal agencies can ensure research independence by using Alternate IV of the general rights in data clause of the FAR (52.227-14 Alternate IV), rather than the special rights clause, in policy evaluation contracts.

Alternate IV mandates agencies to allow contractors to copyright any data first produced "in contracts for basic or applied research…to be performed solely by universities and colleges." Alternate IV also permits agencies to use the same provision in other contracts when the agency determines that the contractor should have permission, the same as given academic institutions, to claim copyright in any data produced during contract performance. This is blanket permission, extending beyond the limited permission for scientific and technical articles already set forth in 52.227-14.

Alternate IV directs agencies to loosen the restrictions that apply to contractors under the general rights in data clause when those contractors are colleges or universities performing applied or basic research OR when the agency determines that similar treatment is warranted for other contractors. And, of course, the section recognizes governmental interests by awarding an unlimited license to government for all data other than computer software.

Government contractors performing evaluations are conducting applied research. The interests of research organizations like MDRC in producing high quality independent evaluations and disseminating results are no different from academic institutions that are engaged in the conduct of applied research. Governmental interests in ensuring that the evaluation is conducted independently, with quality controls imposed by the sponsoring agency, can be rigorously advanced regardless whether the evaluation is conducted by a government contractor or a university.

With Alternate IV as the baseline, agencies can use Section H of the contract, which contains particular clauses related to contract performance, to set review requirements consistent with appropriate oversight, quality control and the goals of the general rights clause. For example, the agency can stipulate in the contract a reasonable period of time for agency review of the evaluator's findings, a process for making comments and suggestions regarding the contractor's reports, and an opportunity for the agency to attach to the final report any dissenting opinion regarding the contractor's findings. Such conditions regarding the use or release of data can also be inserted into the contract's scope of work or in an appendix. These provisions, tailored to the specific context of a research project, can accommodate the agency's need to ensure that its views are incorporated into a final report with the evaluator's need for independence in producing the report.

In sum, contracts drafted using Alternate IV advance the objectives of research independence and reliable evidence unfettered by agency censorship or interference and allow for efficient partnerships across the research community.

- **You described several administrative and procurement obstacles that evaluators face. Which one or two do you see as the biggest barriers to expanding evaluation capacity**?

Two obstacles are fundamental.

a) It is of critical importance that Congress affirm that data that are collected for research purposes may not be used by federal agencies for any other purpose, including enforcement activities. As a general rule, federal agencies should not require the transfer of individually identifiable data from the research contractor to the federal agency during or after contract performance. Sometimes, however, such a transfer is necessary or beneficial for the work, and when that is the case, the government must be able to provide assurances to study participants that data collected for research purposes will not be used for any non-research purpose, including enforcement.

Identifiable data should not be transferred to the government because such disclosure has the unintended consequences of reducing the completeness, validity, and value of the research to the federal government. As required by human subjects regulations and ethical principles for research, research contractors must inform potential research subjects of how their data is to be used. Researchers want to be able to assure potential subjects that the data the subject provides or authorizes for collection will be held confidentially, to the extent permitted by law, by the researcher and the researcher alone. Requiring that the research contractor inform prospective research subjects that their private information may be provided to a federal agency is highly likely to have a chilling effect on the ability of the research contractor to enroll study participants or, once enrolled, to collect reliable and complete answers to survey questions and access to other private information. Once in the possession of the governmental agency, subjects' individually identifiable information might be subject to a myriad of unrelated government purposes, and even public release under the Freedom of Information Act (FOIA).

On occasion, there is a research need for a federal agency to handle the identifiers of individuals who have agreed to participate in an independent evaluation. This has come up either because an agency can help the researchers gain access to administrative data that the agency possesses or because for procurement reasons the agency wants the flexibility to continue the study with a different contractor, and to accomplish this they need access to the identifiers for members of the research sample. In these circumstances, there is an inherent tension between the needs of the research and the necessity of a confidentiality pledge to the research participants. The governmental agency often cannot make the same commitment to confidentiality that a research organization can make, because of statutory requirements regarding access to data held by the government. This means that a clear

statutory commitment that agencies may not use research data or the identity of individuals participating in federal research for any purpose other than conducting the research is needed. That assurance would make it more likely that people will continue to participate in research despite the increased sharing of research data or identifiers that may be needed occur as data systems become more integrated and accessible for a variety of research purposes.

Such an affirmation could be similar to the Confidential Information Protection and Statistical Efficiency Act (CIPSEA), which protects data collected by federal statistical agencies.

b) Reforming the Paperwork Reduction Act to facilitate research and evaluation would facilitate a wide range of data collection efforts. Without this change, agencies will be stopped in their tracks as they try to take advantage of the kinds of quick turnaround evaluations that could -- with the help of emerging technologies -- transform the quality and frequency of continuous program improvement activities in the coming decade.

An example of a productive reform would be to develop standards for providing agency research and evaluation offices with delegated authority to review and approve Paperwork Reduction Act clearances for planned evaluations.[1] Authority could be delegated to agencies, for example, if they (1) have robust evaluation capacity that routinely utilizes the most rigorous and appropriate evaluation design for the questions being asked; and (2) use existing administrative and survey data when possible.

- **MDRC has conducted numerous evaluations of Federal human service programs under the authority of Section 1115 of the Social Security Act. To what extent do you think this provision or authority has encouraged evaluation that may not have otherwise been conducted? Is it worth considering such an authority for other types of programs? Is there a model statute that allows for independent evaluation and ensures that structures and resources are available to conduct such evaluations?**

Yes, a substantial amount of experimentation that occurred in the past four decades would not have been possible without the waiver authority provided under Section 1115. The welfare-to-work experiments that were conducted by MDRC and others in the 1980s and 1990s[2] are an

---

[1] For additional details of potential PRA reforms, see Feldman, A. (2016). *Strengthening Results-Focused Government: Strategies to Build on Bipartisan Progress in Evidence-Based Policy*. Washington, DC: The Brookings Institution.

[2] Gueron, J. M. and Rolston, H. (2013). *Fighting for Reliable Evidence*. New York, NY: Russell Sage Foundation.

example of an agency and researchers using this authority to create a coherent body of evidence that informed future policy.

However, the waiver process is just the starting place for building rigorous evidence. Giving an agency the authority to waive current rules does not guarantee that evidence will be built. In fact, there are cases (such as No Child Left Behind) in which a waiver process was established without a requirement of rigorous evaluation, and the federal government lost the opportunity to inform future decisions with strong research. Therefore, if waiver authority is used as one of the foundations for evidence-based policy, it is critical for it to be accompanied by the following provisions:

Any waiver statute should:

1. Require rigorous evaluation to measure the impacts, implementation, and costs of the new approach compared to current policy, with adequate sample sizes and research designs that can reliably answer the questions being asked. Where cost neutrality is required in the waiver authority, rigorous evaluation should be used to reliably ascertain whether cost neutrality was maintained.

2. Authorize the agency's Office of Research to review the research designs of proposed evaluations of waiver activities. To maximize the reliability of research results, their ratings of evaluations should give preference in impact designs to those that rely on random assignment.

3. Include a set-aside of at least 1% for research and evaluation, and in some cases a higher percentage.

4. Include periodic audits by GAO to monitor the number of waivers granted, the use of evaluation for program improvement purposes, and any other requirements.

5. Authorize the funding agency to request evaluators to communicate what they are learning to the state or local programs that are participating in the study while the study is still going on, to the extent that such communication will not undermine the study's ability to answer the particular research questions that are agreed upon. Such communication can improve the efficiency and effectiveness with which federal resources are being used even during the period of the evaluation, and can increase the benefits that state and local evaluation sites receive from the time and effort they contribute to the study.

6. For some kinds of waiver-based experiments, it can be useful to provide an incentive for the private sector to contribute to the initiative by requiring programs that apply for grants to provide matching funds.

To: Commission on Evidence-Based Policymaking

From: Tom Schenk Jr,
        Chief Data Officer, City of Chicago
        Chair, Civic Analytics Network, Harvard University

RE: Follow-up Input on CEBP mission as defined in Public Law 114-140

It was my pleasure to have an opportunity to provide verbal testimony to the Commission on ways to increase evidence-based policy in our government. The conversation was very helpful and I hope I was able to provide some useful information to members of the Commission. I am following-up on my testimony to provide clarity and more information based on our conversation.

Briefly, my verbal testimony discussed the following ideas:
- Local governments, like Chicago, need to be able to share data between our own departments and between levels of government (e.g., county, state, and Federal governments) to provide better services. We face a number of challenges in this respect, including privacy laws that are interpreted in various ways that increases the time to create data-sharing agreements.
- Commission members should avoid the immense task of building a central Clearinghouse of data; instead, focus on smaller hubs that are topically relevant. This approach is *not* for security reasons, but simply for the pragmatic way to provide some central data services.
- Instead, the Commission should recommend a service where data is merged and deidentified. This service should be a paid service to help fund the activity itself.

Members of the Commission had a number of questions and asked for more details in each of these categories.

Data Sharing Within Government
Since providing testimony, I have reached out to my peers in the Civic Analytics Network—a network of 24 municipal Chief Data Officers (or similar roles) based out of Harvard's Kennedy School of Government and which I am currently serving as a chair. Below, I have incorporated their feedback to provide more detail on the challenges facing cities in using data for evidence-based policy.

Privacy laws are broadly written to provide guidance on sharing data between governments, researchers, private companies, community groups, or anyone else who may want to access education, health, workforce, and other records. However, the experience of anyone seeking data

sharing agreements—including attempts to share relevant data between government departments—is frustrating because of the high degree of local interpretation of privacy laws. Two reasonable attorneys can have different interpretations of the same provisions of privacy laws.

For instance, interpreting the "hard-code" and "minimum necessary" rules from HIPAA has caused difficulty in sharing data. Due to the ubiquity of data that could potentially contain health information, HIPAA guidelines are often used for non-health data decisions, as a precaution against the possibility of the inclusion of some health data.

Subtle but significant differences in legal terminology such as "permit", "prohibit", "allow", "may", and "shall", to name a few. Often, the laws are vague and exhaustive at the same time, such as the HIPAA requirement of the "minimum necessary" use and disclosure of data, which has its own set of complex and subtle rules and exceptions which contain language such as "reasonable steps" and "minimum necessary to accomplish the intended purpose." The reality of this framework is that a very limited number of experts fully understand the privacy laws that govern an entity's activities.

It would be much easier if FERPA / HIPAA / CORI / etc. gave clear guidance about appropriate uses of protected data by affiliated partner organizations and details how about what those partners need to do on their end to ensure privacy protections are maintained (standards for data security, removal of PII, etc.), and (critically) absolves the source agencies of liability if they share in good faith and the recipients don't hold up their end of the bargain. The big worry that impedes sharing even when there is a legal justification is that the data owners remain liable for what their partners do, so that provides a strong disincentive.

Avoiding a Clearinghouse – not because of information security

I proposed that the Commission avoid the task of creating a central clearinghouse of data. The reason to avoid this is because such clearinghouses are extraordinarily difficult to build and attempt to serve all audiences, thereby, tend to serve no audience very well. While the concept of a clearinghouse is attractive, it is not practical.

Others who testified with similar recommendations had mentioned it was partly due to security reasons. Generally, it was argued that decentralized data sources would make it harder for hackers or anyone with dubious intentions to quickly download personal data and subsequently selling the data, providing it to others, or using it in other inappropriate ways.

However, this is dubious. If a Clearinghouse was formed, that does *not* imply the data would be in the same physical location or anyone who accessed the system would have automatic access to

all of the data. That is, data sitting on the same physical computer can be separated so data is separated. In a simple example, many basic computers have the ability to setup distinct users. While all of the data is stored on the same physical drive, no one user needs to have access to all of the data stored on the computer. This notion is *logical* separation of data.

For example, hackers have certainly accessed the systems of social media platforms. Often, you will see these companies clarify which data was precisely accessed. That is because "hacking" a system does not imply all of the data is compromised. Architects of data warehouses—such as a Clearinghouse—use logical separation throughout the system.

This is an important distinction because the most significant risk is the people who can access the data regardless if it is in a central Clearinghouse or stored in various physical locations. If academic researchers are able to combine data, that will naturally increase the risk that the professor, postdoc, research assistant, or anyone else with access to the data could make a mistake, such as storing data on a flash drive[1] or laptops[2] and losing it, or simply sharing the data through email or cloud-storage (e.g., Dropbox) accounts because of elaborate scams[3] or mistakes[4].

The Commission needs to be aware of the true source of risk so it can make recommendations to mitigate those risks. Researchers who access any linked data should have very strict rules on the use and storage of data, such as never storing it on unencrypted flash drives or other mobile devices that could be lost or stolen. The Commission should even consider that the storage of such data should only be on computers that are disconnected from the internet and data must only be stored on encrypted hard drives that meets NIST standards[5].

MATHEMATICA
Policy Research

MEMORANDUM

TO: Commission on Evidence-based Policymaking

FROM: Matthew Stagner   **DATE:** 2/8/2017

SUBJECT: Responses to follow up questions

Thank you again for the opportunity to testify to the Commission and for the follow up questions. Below are the questions you asked and my brief responses. Please let me know if there are further ways that staff of Mathematica Policy Research or I, in particular, can be of assistance. We look forward to following the work and publications of the Commission and wish you well in your work.

You noted the importance of strengthening partnerships between the research community and the public policy and program communities. Do you have specific suggestions the Commission could consider to do this? Are there examples of such partnerships that have worked well?

Thank you for the opportunity to elaborate on this issue. We believe there are multiple approaches to continue testing and strengthening research-policy partnerships. A first step in improving this relationship is improving the layering of evaluation requirements and technical assistance. When federal grant funds require rigorous evaluation, agencies should ensure their

MEMO TO: Commission on Evidence Based Policy
FROM: Matthew Stagner
DATE: 2/8/2017
PAGE: 2

grantees get adequate funds to support local evaluation and technical assistance. Rigorous

evaluation can feel like it is "taking money away" from grantee activities, but there is a strong

"public good" case for building an on-going evidence base. On top of this, we have found that

significant evaluation technical assistance efforts can help local evaluators improve the quality

and usefulness of their evaluations. If grantees, their evaluators, national technical assistance

providers, and federal agencies work together, the evidence base will grow quickly. We are

engaged in many such technical assistance efforts for the Department of Health and Human

Services and the Department of Education, including the Regional Education Laboratory

program and the Youth At-Risk of Homelessness (YARH) program.

Second, the commission may want to enhance role of associations and institutions that

already bring together researchers and policy makers. Federal agencies could encourage

policymaker membership organizations, such as the American Public Human Services

Association, to include researchers in their activities. Through this process, researchers will hear

what is most on the minds of state and local policy makers and will learn more about the contexts

and constraints facing policy makers as they attempt to use evidence. It may also help to have

research organizations such as the Association for Public Policy Research and Analysis connect

more frequently with policy makers. These associations may help to bridge the "cultural divide"

between researchers and policy makers.

Third, federal efforts to improve the training of researchers should focus on the important

skills of conducting practical evaluation research. The next generation of researchers will need

to listen carefully to policy makers' needs and assess the best methods for working quickly to

MEMO TO: Commission on Evidence Based Policy
FROM: Matthew Stagner
DATE: 2/8/2017
PAGE: 3

address those needs. Training programs for social scientists, such as the Department of

Education training programs, could be encouraged to do more to build these skills.

Finally, the commission may want to consider supporting expanded federal efforts that

specifically build and enhance such partnerships. One such effort is the Researcher-Practitioner

Partnerships in Education Research, funded by the Department of Education, Institute of

Education Sciences. These grants focus on building long-term relationships between policy

makers and local researchers. The partnerships carry out initial research on education issues of

interest to policy makers and develop plans for future research. Through this joint research, an

education agency's capacity for taking part in research and using research results can increase.

Funding goes to launch new partnerships and to support the expansion of existing partnerships.

This model may transfer to other policy areas beyond education, particularly human services

efforts.

What datasets do you think are most vital for research and as such should be included in a

federal data clearinghouse if the Commission were to recommend one be developed?

From the Chicago hearing, it appears that much of the Commission's focus has been on data

from the education and labor areas, such as earnings tracked in the unemployment insurance

system or by the Internal Revenue System. Therefore, we focus on other others that may not

have received as much attention, particular issues of health and disability. Without these data,

findings on the connections between education and labor market outcomes may be misleading.

MEMO TO: Commission on Evidence Based Policy
FROM: Matthew Stagner
DATE: 2/8/2017
PAGE: 4

To support research in disability, health and retirement policy, the federal data clearinghouse should include the Social Security Administration's (SSA) administrative and survey data, as well as the Rehabilitation Services Administration's administrative records on state vocational rehabilitation services (annual RSA 911 file). SSA has developed and maintains several analytic files built from multiple administrative file to support internal researchers.

The largest of these is the Disability Analysis File, which contains the most recent 10 years of records on SSI and SSDI applications and disability awards (about 2.5 million records). This database includes a longitudinal record for every Supplemental Security Income or Social Security Disability Beneficiary between the ages of 10 and 65 from 1996 forward (on the order of 25 million records). SSA also maintains a historical Continuous Work History File including a 1% sample of all workers and beneficiaries that is extremely valuable for long-term research and not available to researchers outside of the agency.

Researchers have used SSA administrative data, including the Disability Analysis File, to link to other administrative records that include Vocational Rehabilitation and earnings information. For example, recent SSA research studies have used SSA administrative data linked to the RSA-911 and the Master Earnings File (the SSA file that contains IRS earnings histories) on a regular basis.

Other important sets of data are Medicare and Medicaid records maintained by the Centers for Medicare and Medicaid Services (CMS) and records from the Department of Veterans Affairs, though record linkages between these sources and SSA administrative data are less common. A useful clearinghouse would support linkages between SSA records and state

program records, including Medicaid claims, unemployment wage and benefit records,

vocational rehabilitation records, workforce system records, and public education records.

SSA has also conducted large survey efforts of beneficiaries to gather information not

included in administrative records. For example, SSA's National Beneficiary Survey, which is

routinely linked to administrative records, includes several rounds of data collection for a

nationally representative survey of SSI and DI beneficiaries.   SSA also conducts surveys as part

of demonstration efforts that can serve as additional sources of information about demonstration

participants. It would also be useful to include the one-time National Survey of Child Recipients

and Families, with linked longitudinal administrative records.

National surveys are another potential source of record linkage, particularly for SSA

administrative data.   Specifically, it would be very valuable to include the surveys that SSA,

HHS and Census routinely link to SSA and other administrative records now: six National

Center for Health Statistics Surveys (many for multiple years), the Health and Retirement Study,

the Survey of Income and Program Participation, and the Current Population Survey. Although

these surveys are more accessible to policy researchers than most SSA administrative data, they

remain difficult to access. Maintaining them in a clearinghouse and making them more

accessible would improve synergies between survey and administrative data.

A final consideration is the potential to use administrative records from a clearinghouse to

facilitate web-based surveys. This approach is low cost and an added advantage of broadening

access to administrative data. Administrative data provides a shallow look at a full program

population, and web-based surveys of a sample drawn from that population can provide much-

needed context and a deeper view of particular issues. A recent article by Jaszczak, Sevak, and

10 February 2017

Commission on Evidence-Based Policymaking
Washington, DC

Dear Commission Members:

Thank you for requesting additional information about the Parent Coalition on Student Privacy's position on unit record systems. Below we address all three of the Commission's follow-up questions:

- *Can you please clarify whether your objection is to unit record systems for elementary and secondary school students or if you also object to unit record systems for postsecondary students?*
  See the discussion of this issue below.

- *You argue for local control of student data and specifically for parental and teacher data stewardship. At what point should adult students in postsecondary education become the stewards of their own data?*
  The control of their data should pass to post-secondary students when they become adults, as occurs currently in Federal law.

- *Would your concerns about the intrusiveness of a student-unit record system be mitigated if the data were only maintained without personal identifiers that could be used to track an individual student, and if there were statutory protections that guaranteed that the data could only be used for aggregate, statistical analysis?*
  No, because data can easily be re-identified. If only aggregate data is used, only aggregate data should be collected.

We have significant reservations about the creation of any universal unit record system for students, whether for elementary, secondary or post-secondary students.

Elementary and secondary student unit record systems present a particular set of risks because the majority of information in a child's K12 educational record should not be made "permanent." Childhood is a time of growth, experimentation and development; and mistakes and challenges should not be part of a record that could follow one into adulthood and hamper a child's chance of future success.

A unit record system for post-secondary education does not present an identical set of concerns. Students in post-secondary institutions do expect that some aspects of their transcript, including grades and credits, will persist into adulthood with the expectation of being shared with employers and other educational institutions—with their consent. Yet other contents of their education records should never be made public.

Records from these years may also contain sensitive information about immigration status, counseling records, mental and physical health and disabilities, etc. At the age of 18, control of the record is

transferred from a parent or guardian to the students themselves, but, crucially, privacy controls are still maintained.

We have several concerns about the need for and use of any universal post-secondary unit record system:

1. The efficacy of methods to de-identify or anonymize personally-identifiable data is questionable. De-identified data can often be re-identified and exposed.[1]
2. The government should not have access to a comprehensive database for all post-secondary students as this information could be easily abused for political or immigration reasons. This is especially of concern given the current political climate. The Home Office in Great Britain has now requested access to a similar government student database for the purposes of "immigration control" that was promised to only be used for research.[2]
3. Once the federal government starts collecting post-secondary data, this could easily lead to a creeping expansion of data collection from K12 institutions and districts.
4. The quality of research based on large-scale correlational studies is of greatly varying quality[3] and does not justify the risks of universal tracking.
5. Large amounts of data used for the purposes of evaluating post-secondary institutions' effectiveness are already available, including the Department of Education's College Scorecard, the Mobility Report Card Project—a collaboration of the US Treasury and the Department of Education, and the privately-run National Student Clearinghouse.
6. Extensive regulations have already been implemented to ensure that post-secondary institutions are protecting student's long-term financial interests, e.g. Negotiated Rulemaking on Gainful Employment implemented in Fall 2014.

We acknowledge that given the investment of taxpayer funds that support institutions of higher education, the federal government has a strong practical interest to make certain that those funds are being used efficiently and effectively.

We do not, however, think that a universal student record system created and administered by the federal government is a necessary component of fulfilling that interest and duty.

The federal government spends billions of dollars in medical research and health care as well, and yet there has been no proposal that we know of for the federal government to collect the personal health data for every person in the United States.

---

[1] See, for example, the research of Latanya Sweeney on identifiability.

[2] "The Home Office are turning teachers into immigration officers" G. Bhattacharyya. *Politics.co.uk.*

[3] See discussion from a variety of fields (medicine, psychology and linguistics) in "Data dredging, bias, or confounding." Smith, G.D. and S. Ebrahim. *BMJ*. 2002; "Why Most Published Research Findings Are False." Ioannidis, J. P. A. *PLOS Medicine.* 2005; "False-Positive Psychology: Undisclosed Flexibility in Data Collection and Analysis Allows Presenting Anything as Significant." Simmons, J.P., L.D. Nelson and U. Simonsohn. *Psychological Science.* 2011; and "Linguistic Diversity and Traffic Accidents: Lessons from Statistical Studies of Cultural Traits." *PLoS ONE. 2013.* Roberts S. and J. Winters.

We support only the use of aggregated student data for the evaluation of postsecondary institutions. The collection of such data must include asking for consent for participation from either a parent/guardian or the students themselves if over the age of 18. Clear, transparent information about how any data is to be used and who it may be shared with must be presented before asking for consent. And, there should be no financial benefit or loss contingent on granting the consent.

We continue to urge the Commission to recommend against the creation of any universal federal student unit record system.

On behalf of the Parent Coalition for Student Privacy,
Sincerely,

Cassandre Creswell, PhD
Co-executive director

San Francisco Public Input–Hearing Testimony

Mary Ann Bates, J-PAL North America,
Massachusetts Institute of Technology

Submitted January 26th, 2017

Written Statement for the Commission on Evidence-Based Policymaking
Public Hearing in San Francisco, February 9th, 2017

Introduction

The Abdul Latif Jameel Poverty Action Lab North America (J-PAL NA), based in the Department of Economics at the Massachusetts Institute of Technology, leverages scholarship from 143 affiliated professors to generate and disseminate rigorous evidence about anti-poverty policies. J-PAL NA provides pro-bono technical support, capacity building, and matchmaking with researchers to government agencies and nonprofits seeking to design and implement randomized evaluations, many of which rely extensively on administrative data. Affiliates in our network have conducted 154 ongoing or completed randomized evaluations in North America across sectors such as health care, housing, criminal justice, education, and labor markets. J-PAL NA also creates training materials to build research capacity, including a comprehensive, practical guide to obtaining and using administrative data for randomized evaluations.[1] We appreciate the opportunity to submit a statement to the Commission on Evidence-Based Policymaking.

J-PAL affiliated researchers have relied heavily on administrative data to conduct policy-relevant research. Data from IRS tax records enabled an almost 20-year follow-up of families involved in the Moving to Opportunity Experiment. The follow-up study demonstrated that young children who moved to low-poverty neighborhoods increased their college attendance and expected lifetime earnings.[2] Data from the U.S. Department of Education, the Ohio Board of Regents, and the National Student Clearinghouse collectively enabled a randomized controlled trial showing that simplifying the financial aid application process increased college attendance and persistence.[3] Data from hospitals in the Portland area revealed that Medicaid insurance, for which opportunities to apply were allocated through a lottery in Oregon, increased emergency room usage by 40 percent.[4] Access to administrative data was critical to generating these insights.

Executive Summary

This statement reflects J-PAL's expertise concerning randomized evaluations, administrative data access, and collaboration between government agencies and external researchers. It

incorporates recommendations from an open letter penned by several leading economists, including multiple J-PAL affiliates[5], and a short paper published by a subset of the same authors.[6] This comment elaborates on these key recommendations:

- Establish clear data documentation and standard data request forms, building on the example set by the Centers for Medicare and Medicaid Services.
- Expand secure access to real microdata to qualified researchers, prioritizing secure remote connections while also increasing capacity at Census Research Data Centers.
- Develop a data clearinghouse within the Census Bureau for currently hard-to-access data, particularly microdata on earnings and income, and link the data across agencies.
- Avoid flat per-user fees for data access to encourage validation and double-checking of data analysis.
- Clearly articulate program objectives and build ongoing process evaluation into every program to lay the foundation for impact evaluation.
- Institutionalize a process for identifying questions for program evaluation and appropriate conditions for randomized evaluations, focusing on three cases:
    - Demand for a program exceeds capacity to supply the program.
    - Gradual roll out of a program to different individuals or locations over time.
    - Refinement or reconsideration of eligibility criteria for a program.

Responses to Specific Questions Posed in the CEP Request for Comments

3. Based on identified best practices and existing examples, how should existing government data infrastructure be modified to best facilitate use of and access to administrative and survey data?

Build on the example of the Centers for Medicare and Medicaid Services to establish clear data documentation and standard data requests.

Existing government data infrastructure should incorporate standard data request forms with clear data dictionaries, using the Centers for Medicare and Medicaid Services (CMS) Research Data Assistance Center (ResDAC) data documentation as a model of best practices. The ResDAC system allows researchers to understand specifically what variables are available and to submit requests with data protection plans. Because the ResDAC system allows CMS to review those requests systematically as opposed to on an ad hoc basis, ResDAC facilitates routine, secure access to administrative data that culminates in several hundreds of medical studies each year.[7]

Applying the ResDAC model to an administrative data clearinghouse or other data repositories would allow researchers to see exactly what variables they are permitted to request, along with a

[7] Ibid.

brief description of each variable, before submitting a request. This explicit listing of available variables would enable data discovery and save program administrators and researchers hours of valuable time by avoiding long correspondences about whether the desired data exist. Publicizing exactly which variables exist and what agency houses the data increases transparency with no risk of revealing personally identifiable information. Better data documentation can thus facilitate use of and access to administrative and survey data without raising concerns for data security and privacy protection.

Moreover, sensitive variables that would trigger additional levels of review or security could be clearly labeled as sensitive as part of this clearer data documentation. Currently, researchers may request a variable that is not central to their analysis, without realizing that it captures sensitive information. This could delay or jeopardize the entire request or allow access to sensitive data that, with clearer data documentation, would not have been requested from the agency.[8]

4. What data-sharing infrastructure should be used to facilitate data merging, linking, and access for research, evaluation, and analysis purposes?

Expand secure access to microdata to qualified researchers through remote and on-site connections rather than creating synthetic data.

An optimal infrastructure for integrating administrative, survey, and statistical data to facilitate research and evaluation while ensuring data security and privacy will provide secure environments where qualified researchers can directly access microdata. Microdata enable researchers to perform more informative analyses by controlling for individual characteristics (such as educational attainment or race) to better determine the impact of a program. Microdata also allow researchers to evaluate how a program affects specific subpopulations, such as low-income individuals. Researchers can use microdata to validate and adjust their analysis as they learn from the data in real time—a crucial step in the research process. Moreover, for analysis in rigorous randomized evaluations, researchers require microdata to link individuals to their treatment status.

There are currently twenty-four Federal Statistical Research Data Centers (RDCs), which are physical, secure environments established through partnerships between the Census Bureau and research institutions where researchers who have undergone special sworn status can access restricted microdata. However, capacity in these RDCs is limited, both physically and according to Census bandwidth, and access is artificially restricted to researchers based on geographic proximity rather than on the merit of their research proposal.[9] Similar constraints apply to researchers working with statutorily restricted tax data through contracts with the IRS Statistics of Income Division (SOI)—the type of arrangement that enabled the Moving to Opportunity follow-up study. The SOI is small, has a limited budget, and can accommodate few research projects at a time.[10] More secure, direct access to microdata should be provided in two ways: (1)

---

[8] Feeney et al., "Using Administrative Data for Randomized Evaluations," 2015.
[9] Card et al., "Expanding access to administrative data," 2010b.
[10] Office of Management and Budget, *Barriers to Using Administrative Data for Evidence-Building* (white paper submitted for the Commission on Evidence-Based Policymaking, July 15, 2016). https://www.whitehouse.gov/sites/default/files/omb/mgmt-gpra/barriers_to_using_administrative_data_for_evidence_building.pdf

preferably through remote, secure connections such as the "flexiplace" systems used by federal employees who work with restricted data from home, but also (2) through expansion of on-site secure environments in the form of additional space and funding for Research Data Centers and similar centers at other statistical agencies.[11]

Synthetic data, one alternative to expanding remote and on-site secure connections to restricted data, are a far inferior option for enabling policy-relevant research and program evaluation. Synthetic data are constructed to mimic certain features and aggregate characteristics of real data without containing real individual-level information. Although this appears—on its surface—to enable research while protecting privacy, synthetic data suffer severe disadvantages relative to real microdata. Synthetic data may be incompatible with randomized evaluations and other rigorous program evaluations because researchers must be able to link individuals to their treatment status—i.e., whether a particular person received a program or not. Furthermore, synthetic data make it difficult or impossible to study subpopulations, such as low-income individuals, which may be of particular policy interest. Researchers would have to specify each subpopulation they intend to study and all necessary contents of the data in advance. This may be impossible, in part because researchers often revise their analyses to address observations they learn from the raw data.[12] Meanwhile, data administrators would have to create new synthetic datasets for each request to study a specified subpopulation, which would require significant infrastructure and personnel.

7. What data should be included in a potential U.S. government data clearinghouse? What are the current legal or administrative barriers to including such data in a clearinghouse or linking the data?

<u>Establish a data clearinghouse within the Census Bureau for currently hard-to-access data, particularly microdata on earnings and income.</u>

For reasons discussed in response to question 4, the data should be real microdata rather than aggregated, de-identified, synthetic, or perturbed data. The clearinghouse should prioritize data that do not already benefit from strong infrastructure for access. Specifically, a clearinghouse should be developed for federal income and earnings microdata and focus on enabling researchers to link these data to the extent legally possible.

Income and earnings data have less well-developed access infrastructure and face several legal barriers to use for program evaluation, meaning that the clearinghouse would not be redundant.[13] For example, individual states maintain their own data system for Unemployment Insurance (UI) records, with individual discretion and statutory protections on providing access to this data. The Department of Labor does not store the data in a central location. Although the Census Bureau has made a significant contribution to accessing state UI data through the Longitudinal Employer

---

[11] Card et al., "Expanding access to administrative data," 2010b.
[12] Ibid.
[13] Ibid.

Household Dynamics Program (LEHD), the LEHD program requires that researchers be on-site at a designated Research Data Center.[14]

With infrastructure secure enough for the highly restricted data from UI and tax records established, the clearinghouse should then focus on facilitating linkage of these data with other, less restricted data. Federal data on income, namely tax records or Unemployment Insurance records, are in high demand because income can serve as a key outcome variable for many government programs or policies in education, job training, criminal justice, and place-based interventions.[15] For example, earnings—as measured by tax records—was a key outcome variable in the follow-up study of the Moving to Opportunity Experiment.

8. What factors or strategies should the Commission consider for how a clearinghouse(s) could be self-funded? What successful examples exist for self-financing related to similar purposes?

<u>**Avoid flat per-user fees for data access to encourage validation and double-checking of data analysis.**</u>

As is customary, a clearinghouse may charge fees for accessing data, such as a fee per project, a fee for sets of users, or an initial fee for the first user followed by much smaller fees for additional users. It should not charge the same flat fee per person for accessing the data because this severely discourages the double checking crucial to correcting human errors. Despite its clear data request process, CMS charges a fixed fee of $25,000 per person who accesses identifiable data through their Virtual Research Data Center.[16] This may create problems because researchers often need multiple people to work with the data to ensure accuracy—including people who effectively proofread to correct for human coding errors. With fixed per-person costs, researchers either pay a large inflexible sum of money for someone to double check the analysis or—facing tradeoffs given limited research funds—forego a set of "fresh eyes" to double check the analysis at risk of making mistakes. Therefore, by creating a high marginal cost to adding additional users, charging a fixed fee per data user effectively institutionalizes mistakes.

18. How can or should program evaluation be incorporated into program designs? What specific examples demonstrate where evaluation has been successfully incorporated in program designs?

<u>**Clearly articulate program objectives and build process evaluation into every program to lay the foundation for impact evaluation.**</u>

Process evaluation is always needed and constitutes a critical prerequisite for impact evaluation. It is not sensible to ask whether the program is succeeding or failing to deliver outcomes without first knowing whether the program itself is being delivered with fidelity. In some cases,

---

[14] Ibid.

[16] Research Data Assistance Center. "Fee List for RIFs: Physical Research Data Requests." Centers for Medicare and Medicaid Services. https://www.resdac.org/sites/resdac.umn.edu/files/CMS%20Price%20List%20for%20Research%20Files_23.pdf Accessed October 31, 2016.

important questions about how a program can or should function may be sufficiently answered by process evaluations, needs assessments, or literature reviews. Rigorous impact evaluation, particularly randomized evaluation, should be pursued when the benefits in terms of knowledge generated would likely outweigh the costs of the evaluation, and when planning during program design can facilitate impact evaluation. [17]

Many components that aid process and impact evaluation should be developed during program design:

- Precisely articulated program objectives.
- A needs assessment clearly articulating the problem that the program will address.
- Standard outcome measures used in research literature about similar programs that allow potential impact evaluation results to be compared to those in other studies and used in cost-effectiveness analyses.
- A plan for data collection and flow from program practitioners to administrators. This includes planning in advance to collect identifying information, such as Medicaid ID numbers, to enable later matching of program-level records to administrative records for impact evaluation.

As an example of incorporating evaluation into program design, Benefits Data Trust (BDT) is working with J-PAL North America in an ongoing randomized evaluation of different outreach strategies to increase enrollment in the Supplemental Nutrition Assistance Program (SNAP) among eligible but unenrolled individuals in Pennsylvania. BDT had a clear grasp of the need its program addressed: despite awareness among eligible households that SNAP exists, many people could not imagine navigating the enrollment process alone. BDT had the clear program objective of increasing benefits enrollment, and change in program enrollment is a standard outcome that could be compared across different studies. BDT and researchers agreed that based on a review of the existing research, there was little rigorous evidence about what interventions can increase SNAP enrollment.

Although BDT was already providing enrollment assistance and sending outreach, BDT worked with researchers to design and test two distinct outreach activities—one high-touch intervention including a letter plus enrollment assistance and one low-touch intervention including a letter only. The researchers also worked with BDT to design a new letter for the evaluation based on marketing and psychology literature. Seeing quickly that this newly designed letter was more effective, BDT plans to incorporate this letter design in other states outside of Pennsylvania. Ultimately, the impact of the different outreach strategies will be measured using administrative data, which can be accessed according to a data use agreement with the Pennsylvania Department of Human Services.

19. To what extent should evaluations specifically with either experimental (sometimes referred to as "randomized control trials") or quasi-experimental designs be

---

[17] Glennerster, Rachel, and Kudzai Takavarasha. *Running randomized evaluations: A practical guide*. Princeton University Press, 2013.

institutionalized in programs? What specific examples demonstrate where such institutionalization has been successful and what best practices exist for doing so?

<u>**Institutionalize a process for developing specific research questions and determining the appropriate conditions for randomized control trials or other evaluation methods.**</u>

Federal agencies should institutionalize a process of developing high-priority research questions and determining the most appropriate evaluation methodology, following the precedent set by the Social and Behavioral Sciences Team (SBST). SBST launches demonstration projects—usually in the form of randomized evaluations—to rapidly evaluate low-cost applications of behavioral science to achieve desired outcomes, such as increasing workplace savings plan enrollment among military service members or increasing the rate at which indebted graduates apply for income-based loan repayment plans.[18]

When properly designed and implemented, randomized evaluations rigorously demonstrate the causal impact of a program by establishing the counterfactual—what outcomes would exist for program participants if they had not received the program. Random assignment ensures that, with a large enough sample, the group that receives the program and the group that does not are similar on average before the start of the program. Therefore the impact estimate from a randomized evaluation offers confidence that any differences in outcomes between the two groups are a result of the program. The ability to isolate program impact from self-selection or other confounding factors is why randomized evaluations are widely recognized as a highly credible method for estimating program impact. Where there is little internal experience implementing randomized evaluations, agencies should seek partnerships with external or academic researchers who are vested in similar questions.

Randomized evaluations can only occur when randomization is built into the program design. However, randomization should not be incorporated indiscriminately; rather, randomization should be incorporated into programs to facilitate randomized evaluations where appropriate on three grounds:

- The current evidence for answering the well-defined research question is non-existent, insufficient, or inconclusive.
- There is a clear unit of randomization—individual program participants, schools, clinics, etc.—for which there is a large enough sample size and a clear means of tracking outcomes for both the treatment group and the control group.
- Randomization is feasible and ethical. Although not an exhaustive list, the following conditions offer opportunities where randomization may be feasible and ethical:
    o Demand for a program exceeds capacity to provide the program. A lottery may be a fairer alternative than allocating slots on a first come, first served basis—particularly when a goal of the program is equity of access—and offers an alternative to imposing increasingly narrow eligibility criteria under funding constraints.

---

[18] Social and Behavioral Sciences Team. *2016 Annual Report*. Executive Office of the President, National Science and Technology Council. September 15, 2016. https://sbst.gov/assets/files/2016%20SBST%20Annual%20Report.pdf

- o A program is being expanded by gradually offering it to individuals, schools, or districts until full coverage is reached. A lottery can be used to randomly assign the order in which individuals or units receive the program. The individuals or units that have not yet received the program serve as the control group until all units receive the program.
- o A new intervention—such as a financial incentive or care coordination services— will be added to an existing program. Program participants can be randomized to receive different versions of the program, e.g., with or without the added intervention, to isolate the impact of the new intervention.
- o Program eligibility criteria are being refined or reconsidered. People just above/below the eligibility cutoff can be randomly assigned to receive or not receive the program to determine whether it is effective for this marginal group. Meanwhile, those well within the program eligibility cutoff, automatically receive the program, and those well outside the cutoff do not qualify for the program.

As a specific example of institutionalizing a randomized evaluation, the South Carolina Department of Health and Human Services is partnering with J-PAL North America to incorporate a randomized evaluation in its expansion of a nurse home-visiting program for low-income mothers delivered by the nonprofit organization Nurse-Family Partnership (NFP). The specific, high-priority research question is whether a new, less expensive version of the NFP program that South Carolina is expanding will be as effective as the pre-existing version that has been rigorously evaluated before.

A randomized evaluation was found to be an appropriate method for answering this question given excess demand for the program. Although South Carolina is expanding this less expensive version of NFP to thousands of mothers through an innovative pay-for-success initiative, the program does not have sufficient resources to serve all of the women who are eligible. Applicants will be randomly assigned, on a rolling basis from 2016 to 2020, to either a treatment group that is offered access to the program, or to a control group that is not.[19] We will assess the effect of NFP on a range of short- and long-run maternal and child outcomes using administrative data that will be available for all members of both treatment and control groups. This will yield useful evidence for South Carolina and for policy makers nationally, who are interested in the broader health and financial consequences of expanding Medicaid to include similar services.

---

[19] The Abdul Latif Jameel Poverty Action Lab. "The Impact of a Nurse Home Visiting Program on Maternal and Child Health Outcomes in the United States." Accessed October 24, 2016. https://www.povertyactionlab.org/evaluation/impact-nurse-home-visiting-program-maternal-and-child-health-outcomes-united-states

Appendix to the Original Written Statement

During J-PAL North America Executive Director Quentin Palfrey's testimony at the public CEP hearing in Chicago on January 5th, Commissioner Abraham asked a question about J-PAL's views on user fees. To clarify our initial statement, we do not suggest that data repositories avoid charging fees in general. We suggest only that data repositories avoid flat per-user fees for data access, since these can discourage researchers from having multiple team members access the data and reduce opportunities to prevent data analysis errors. As is customary, we recommend that a clearinghouse charge reasonable fees for accessing data, such as a fee per project, a fee for sets of users, or an initial fee for the first user followed by much smaller fees for additional users.

As one example, J-PAL has ongoing research partnerships with the state of South Carolina which have been benefited from South Carolina's integrated data system and clear data access procedures. The integrated data system South Carolina has built over time, which is housed at the Revenue and Fiscal Affairs Office makes it easier for government and independent evaluators to assess the impact of government programs. This has made South Carolina a promising location for researchers interesting in answering crucial policy-relevant questions related to maternal and child health, the opioid crisis, health insurance rating systems, and much more. As just one example, South Carolina's Department of Health and Human Services (SCDHHS) has partnered with J-PAL affiliates to use this infrastructure to evaluate how expanding the Nurse-Family Partnership through a pay-for-success contract affects the health and long-term economic outcomes of mothers and children enrolled in the program.

Commissioner Haskins also asked us to provide examples of specific datasets for which the Commission should prioritize improving access. Based on conversations with our professional staff and affiliates, we suggest prioritizing access to administrative data on earnings and income that are currently hard to access, such as unemployment insurance wage records and Social Security Administration data. There are a number of administrative datasets for federal programs that are maintained at the state level, such as records for UI, SNAP, and TANF, and researchers must gain access to these data on a state-by-state basis. There is a great deal of arbitrary variation between states in the application process, the time it takes for applications to be considered, and the likelihood that an application is approved. These state-level access burdens can be very discouraging for researchers interested in important policy questions related to these programs. We suggest that the Commission look for ways to ease access to these state-level datasets by harmonizing data collection and application processes. For example, the Commission could recommend a carrot/stick strategy to encourage states to share their data with CARRA for research purposes, allowing researchers with CARRA-approved projects to access these data more systematically. The Commission could use a similar strategy to encourage the use of common metrics across states so data can be more readily linked across states.

In addition, the Commissioners expressed interest in examples of institutions or structures that have successfully created opportunities for policy-relevant research and partnerships between academics and government. J-PAL has worked with a number of governments internationally and in the United States to create mutually beneficial partnerships between these public entities and academic researchers. These partnerships have allowed public officials and academics to

9

work together to identify important research questions, conduct high-quality evaluations, and implement the learnings from these evaluations into policy action.

We have found that specific structures can be put in place that facilitate governments sharing the priority questions they would like research to address, and then developing specific prospective research projects in close collaboration with external researchers. The intent is to have prospective evaluations emerge not in isolation either from government or from external researchers alone, but rather as part of an on-going collaboration. Two examples include sector-specific commissions and innovation initiatives.

Commissions that have a mandate to test policy innovations in a particular policy area are one example of such a structure that has been implemented internationally. For example, MineduLAB is an innovation lab for education policy housed within the government of Peru. The MineduLAB team of four monitoring and evaluation professionals is nested inside the Ministry of Education (Minedu) Secretariat of Strategic Planning (SPE). The lab pilots and evaluates the effectiveness of innovations with the ultimate goal of allowing the Ministry to use evidence to improve children's learning throughout the country.

Critical to this success is the lab's close ties with academia. The collaborative MineduLAB process combines the researchers' expertise with the political and operational experience of policymakers, ensuring that the innovations tested before scaling-up are informed by existing rigorous evidence and cutting-edge theories on education and behavioral economics.

Innovation Initiatives can create a mechanism for developing collaborative research partnerships that focus on policy maker's priority policy issues. International examples include the Government of Tamil Nadu in India, which has set up the Tamil Nadu Innovation Initiative, which works with researchers to call for proposals on an ongoing basis, select the most promising ideas based on local needs and existing evidence, design pilot programs, and rigorously evaluate them to understand their impact. In France in 2008, the government created the Experimental Fund for Youth, which set aside 320 million Euros to learn which programs are effective in helping youth improve educational outcomes and social and professional integration. The fund sets aside funding for rigorous evaluations, with a focus on randomized evaluations. In the US, competitions such as the Government Performance Lab's technical assistance competition and the J-PAL State and Local Innovation Initiative provide platforms for state and local governments to bring their priority research questions to external research teams.

To: Commission on Evidence-Based Policymaking (CEP)
From: Joy Bonaguro, Chief Data Officer, City and County of San Francisco
Date: January 23, 2017
Re: Issues relevant to CEP's charge established in Public Law 114-140

Evidence-based policies help government agencies provide more efficient and effective services for Americans. Individuals tend to support data use that improves their lives, whether it be as consumers or citizens. At the same time, individuals expect government use of data to protect their individual privacy and confidentiality. These two concepts need not stand in opposition to one another - constructive and responsible data use can both improve lives and uphold privacy.

Against this context, social service delivery is in the midst of a migration from program to people centric care. Our most vulnerable individuals touch multiple systems - education, human services, and housing - which have historically operated in silos. The transition to coordinated, person-centered care will better meet the needs of our clients by tailoring care to meet the needs of each individual, rather than using a one-size-fits-all approach.

A coordinated care approach is most effective when jurisdictions and programs can share data about the individuals they jointly serve to avoid duplication and offer the right mix of services. As a result, evidence based policy is not simply a function of retrospective studies, but continuous improvement, which the commission here today was charged to study. Continuous improvement is predicated on real time data linkage to facilitate care coordination. While the bulk of the Commission's charge is focused on data linkage for study, we also encourage the commission to recognize the importance of care coordination to ensure quality care in real time.

The remainder of my comments focus on the Commission's duties per Public Law 114-140.

Section I. How best to incorporate outcomes measurement, randomized controlled trials, and rigorous impact analysis

More rigorous evaluation and a focus on outcomes is essential to continuously improve government policy and programs. The recommendations below help promote this locally.

1. **Establish and harmonize outcomes-based measures for major areas of program funding.** Too many agencies require a variety of reports often focused on activities (e.g. how many served) and not outcomes (e.g. how much better off). Those reports vary across funding streams and over time, often resulting in costly changes to administrative data systems. The result is time and effort spent on reporting compliance versus assessing what works. A word of caution for any outcomes framework: not achieving an outcome is not necessarily grounds for marking a program as a failure. Some programs may be preventing even worse outcomes. Instead, outcomes metrics should be used to continuously improve and modify programs; and
2. **Selectively fund RCTs and lottery based services.** Some portion of federal program dollars could be predicated on lotteries leading to randomized controlled trials. While not appropriate in all cases, a lottery requirement as a function of funding would help local programs overcome resistance to experimenting more with lotteries. Lotteries are not appropriate for services where a clear and consistent set of criteria is known for prioritizing program access and program resources are sufficient.

Section II. Legal and administrative barriers.

Perhaps the most significant barrier to data linking is navigating a thicket of sector-specific, jurisdiction-specific and sometimes conflicting statutes and standards regarding data privacy and security. The recommendations below provide several avenues to remove these barriers and spur evidence-based policy through integrated data, while maintaining privacy.

A. Statutory and regulatory changes could broaden opportunities for data sharing. The following recommendations identify opportunities to modify privacy statutes and regulations.

1. **Streamline and harmonize complicated and often contradictory federal data and privacy regulations.** Changes should allow for more flexibility in data sharing across health, human services, housing, and education agencies, while continuing to ensure strong, consistent privacy protections. Regulations and standards can be streamlined and harmonized around key principles (e.g. role-based access, limited use) and consistent definitions (e.g. of personally identifiable information);
2. **Implement exemptions to existing data and privacy regulations to allow for data sharing between local government services and agencies and with designated partners for limited purposes.** Purposes covered by exemptions should include program evaluation, continuous improvement, policy-relevant research, cost-benefit analysis by qualified researchers and institutions, and care and service coordination; and
3. **Consider the creation of an omnibus federal information privacy law.** This avenue is supported by advocates across industry, academia and government as a means of promoting efficiency, accuracy and integrity of information as well as encouraging a clearer understanding of privacy requirements by individuals, industry and government.

B. Administrative actions could ease the burden of legal interpretation. Often, the most significant barrier to confidential data sharing is not the interpretation of any single statute, but navigating a series of statutes. Each jurisdiction navigates this thicket afresh, which concentrates risk on individuals and localities interpreting the law and serves as a disincentive to integrated data. More regulatory guidance per the following recommendations would help local governments consistently and responsibly interpret confidentiality laws.

1. **Provide cross-agency guidance for data sharing across multiple bodies of law (e.g. FERPA, HIPAA, HMIS etc).** While policy specific guidance is helpful, integrated guidance across policies is more useful for the local practitioner. For example, the Administration for Children & Families released a Toolkit[1] for sharing data across six programs;
2. **Provide model data use agreements (DUAs) that take into account the cross-agency guidance.** Model DUA terms, which build on the prior recommendation, could accelerate adoption among agencies. A 2013 GAO report[2] notes that model or example DUAs are especially needed in health and human services;
3. **Partner with states to provide guidance as to the interaction between state and federal privacy requirements.** State specific statutes can further complicate the legal path towards integrated data. Developing model frameworks in partnership with states can reduce the local burden of interpretation;

---

[1] Available at
https://www.acf.hhs.gov/sites/default/files/assets/acf_confidentiality_toolkit_final_08_12_2014.pdf.
[2] "Human Services: Sustained and Coordinated Efforts Could Facilitate Data Sharing While Protecting Privacy" available at http://www.gao.gov/assets/660/652058.pdf.

4. **Convene major states and select localities to identify opportunities to harmonize requirements and guidance.** States and localities provide a "boots on the ground" perspective on existing and emerging data linking challenges; and
5. **Create and maintain a single website for cross-agency guidance.** Finding timely guidance requires hunting across multiple sites. A cross agency webiste could serve as the umbrella to shepherd the recommendations above.

Section III. Clearinghouse and data-sharing infrastructure.

To promote evidence-based government, further investments in data and digital infrastructure, could include the following:

1. **Pilot policy "labs" or "hubs" that focus on using data integration to answer a specific problem or issue.** Pilots could focus on a key health care outcome or topic such as recidivism. Pilots would allow experimentation at a small level and achieve "quick wins" ahead of introducing any larger clearinghouse. Pilots could evolve in an agile manner through continued integration of more data and eventually interoperable hubs;
2. **A central service for matching personally identifiable data and then de-identifying for the purpose of research.** Matching and linking data across systems can be a challenge and burden for local entities due to the expertise required and may disincent research partnerships. A central service could lend consistent technical expertise to the task of data matching; and
3. **Ensure government data is broadly available as open data whenever possible.** The burden of data access is reduced when government data is proactively made available. A combination of open and closed data is needed for evidence-based policy.

Section IV. Limitations on data access and use

Limitations on data access and use should be developed from a risk management perspective, with the limits commensurate to the privacy or security risk posed by the data. Rather than focusing on whether others can *have* data, a risk management approach allows agencies to designate *who* should have access and *for what purposes* based on a data classification scheme. Specific methods for managing risk in a data sharing context might include:

1. Establishing review committees to assess the risk/benefit of the proposed research;
2. Ensuring the data-sharing infrastructure supports role-based access, and developing model protocols and procedures to support role-based access; and
3. Developing model data use agreements and/or Terms of Use for data-sharing that restrict researchers and other individuals with access from using confidential data to re-identify individuals or for purposes not specified in the scope of work.

Section V. Incentives to facilitate interagency sharing of information

Eliminating legal and administrative barriers and providing information resources and guidance, as discussed in Section II, are major steps toward achieving greater interagency sharing of information. Additional incentives to promote interagency sharing of information could include:

1. Allocation requirements for analytics and evaluation in federally funded programs;
2. Allocation requirements for data and infrastructure in federally funded programs to ensure the consistent collection and availability of quality data;
3. Grant and funding criteria that reward interagency proposals; and
4. Waivers that would allow states and localities to pursue a coordinated care approach and build the case for needed regulatory and statutory changes.

Section VI. How data and research can inform policy-makers and programs

A gap often exists between research and practice. This gap exists in at least two forms: 1) a gap between what researchers find and its application to practice and 2) a gap between what practitioners need and what researchers find compelling to study given a historical focus on original research and a bias towards positive results.

To close the first gap:

1. **Researchers should provide practical information and concrete steps or recommendations to guide decision-making, not just journal articles.** This could include research with short-form extracts, sections on practical policy recommendations, data visualizations, geographic breakdowns, or breakdowns by subgroups relevant to programs. Frameworks for measuring impacts and evaluating programs should take into account the resources and ability of agencies, including the recognition that academic peer review and practical implementation may have different standards (that is don't let perfect be the enemy of good); and
2. **Establish centers of practice responsible for translating and consolidating research results.** While journals provide the service of publishing results, few entities combine the results into practitioner handbooks. It is the rare local agency that can stay on top of the research across disparate fields to understand what programs or actions have the strongest evidence base in their field.

To close the second gap of aligning incentives between researchers and practitioners, consider the following recommendations:

1. **Incent researchers to partner with programs and practitioners.** Funders could require or favor research and grant submissions that included a program or policy partner and an applied research question; and
2. **Seed research centers at local universities with joint academic and practitioner governance.** For example, the John W. Gardner Center at Stanford develops its research agenda in partnership with the San Francisco Unified School District and a pool of funds helps incent applied research in collaboration with the school district.

Commission on Evidence-Based Policymaking

Doing What Works in Community-Based Organizations

Susan N. Dreyfus, president and CEO

Alliance for Strong Families and Communities

January 22, 2017

Thank you for the opportunity to contribute to the important work this Commission on Evidence-Based Policymaking has undertaken. It is an honor to speak with you today on behalf of the Alliance for Strong Families and Communities, where I am the president and CEO. Prior to joining the Alliance, I was secretary for the Washington State Department of Social and Health Services, where I had responsibility for Medicaid, child welfare, behavioral health, juvenile justice, economic assistance, and other human services. I also served as Wisconsin's first administrator of the Division of Children and Family Services. Most recently, from 2014-2016, I served as a commissioner for the federal Commission to Eliminate Child Abuse and Neglect Fatalities.

The Alliance's network of human service organizations is grateful that you are facilitating this conversation, as we believe this is the right time for significant steps forward in developing a modern human services sector that leads to stronger, healthier families and communities. The Alliance strategic action network is uniquely positioned to share its perspective on evidence-based policymaking because community-based organizations provide the majority of services in the social sector and generate the majority of outcomes data used to inform best practice development.

I will begin with some background information about the Alliance for Strong Families and Communities. The Alliance is a national strategic action network of nearly 450 nonprofit, community-based organizations dedicated to achieving a vision of a healthy and equitable society for all children, adults, and families. Many organizations in this network have more than 100 years of human service leadership experience.

It was formed in 1998 by the merger between Family Service America and the National Association of Homes and Services for Children, and expanded during a 2014 merger with the United Neighborhood Centers of America. The result is the nation's largest network of human-serving organizations working with their neighbors on the front lines to enhance the lives of Americans. The Alliance works for transformational change by representing and supporting its network as members translate knowledge into best practices that improve their communities. We help members successfully meet the challenges of today and prepare for those to come.

The sector stands ready to fully engage in policy conversations that could shape human services and impact equity and opportunity in our nation for years to come. We bring

extensive knowledge and have a responsibility to inform changes being considered at the local, state, and federal levels with the lived experiences of the people we serve. For example, when elected leaders talk about jobs as the single solution to a vibrant economy, our sector's voice is critical to broadening the lens to encompass the social determinants of health and the latest advances in neurosciences to that conversation. As important is our effort to advance equity across our country to ensure all of our citizens have equal access and opportunity to realize their full potential and share in the prosperity of our great nation.

There are three main ideas I would like to discuss with you today:

1. Context matters. Organizations must align and integrate with others in their ecosystems to promote efficiencies and better outcomes.
2. Developing a deeper appreciation for research evidence among human service staff can produce better outcomes for children and families.
3. Evidence-based and informed practices need to be implemented within a research and development infrastructure that is equipped to support fidelity, quality service delivery, positive outcomes, and innovation.

Context Matters

Organizations have the capacity to be feeders of knowledge, but they face contextual factors that are outside of their control. The context in which people, programs, and systems operate must be taken into consideration when discussing evidence-based programs and policymaking. If organizations embrace evidence-based outcomes without aligning with other organizations and sectors in their ecosystem, the intended outcomes are less likely to be achieved. Take the case of a community-based organization that enrolls a family in an evidence-based program to meet the family's needs. The same family has children who attend a school with policies and procedures that run counter to the latest knowledge in brain development. As human-serving programs apply evidence, they often come across external barriers. The context in which social sector organizations operate needs to support their use of evidence.

It is important to think about the four levers of systems change. We always focus on the first one, practice, but we rarely get to the other three: policy, regulatory, and fiscal change. The Alliance, through our strategic action network, is aiming to be more intentional about the use of research and its implications for our work beyond merely changing practice and interventions. Because if we change practice, it changes for one person, one worker, and one agency, at one given time. But until the evidence gets hardwired into policy and regulatory change, along with fiscal alignment, we will have programs operating in unsupportive environments. True systems change requires us to pull all four levers, not just the quick and easy lever of doing our practice differently. If the other three levers are not also addressed, evidence-based programs are here today, gone tomorrow, and we will not attain sustainable and meaningful systems change that can truly improve the lives of children, families, and communities.

When I was secretary in the state of Washington, I asked researcher Dr. Mark Courtney to look at all of the child neglect cases in our child protection agencies. He found that two of the biggest challenges these families faced were related to housing and economics. The challenges were unrelated to what the child welfare agency was doing or not doing to support those families. It was a much broader picture than whether the programs that we had control over were working. For this reason, it is critical that systems are integrated so they are familiar with the programs and services offered by one another and can help put needed services in place in a timely manner for families.

During my experience on the Commission to Eliminate Child Abuse and Neglect Fatalities, I was reminded of a principle in social psychology called the fundamental attribution error, thanks to testimony from Dr. Gary Melton at the Kempe Center in Colorado. This principle is the tendency to attribute behaviors to a person's internal qualities while underestimating situational influence. Both the general public and human service professionals tend to overemphasize individual factors and underemphasize situational ones. Organizations focus on what they are doing to help one person, but they have a limited ability to influence the context in which that person lives every day. We know from the research there are social determinants of health that influence the well-being of children, families, and communities. For example, if a program seeks to connect a family to medical care or substance abuse treatment, it may need to examine the underlying issues of education and employment in order to support that family's success. *The recommendation is that context matters, and health and human services leaders must be encouraged to align and integrate with others who operate in their ecosystems in order to achieve efficiency and better outcomes.*

Developing a deeper appreciation for research evidence among staff can produce better outcomes for families.

Evidence from child welfare research can and should be used when making decisions, whether those decisions are being made by policymakers, agency directors, or social workers who directly interact with families. However, there is a lack of research about how research evidence is generated and used and whether its use produces better outcomes for children and families. To help answer these questions, 26 private child welfare agencies, some of which are members of the Alliance network, participated in a project on research evidence use funded by the W.T. Grant Foundation in 2013-2014. The project was led by Fred Wulczyn, Ph.D., senior research fellow at Chapin Hall Center for Children at the University of Chicago. This project sought to accomplish three main objectives:

1. Establish the extent to which individuals who work for child welfare agencies use research evidence when making decisions about how to work with children and families.
2. Determine whether staff use of research evidence is associated with characteristics of agencies and improvements in the permanency rate at the agency level.
3. Examine the connection between evidence use and outcomes.

The findings of this research indicate that developing a deeper appreciation for research and evidence use among staff can produce better outcomes for families. Findings include:

- Child welfare staff with a positive attitude toward evidence, more child welfare experience, and the know-how to find research evidence, were more likely to acquire research evidence as part of decision making.
- Agencies with more staff who use research evidence move children to permanency significantly more quickly than agencies with less staff who use research evidence.
- Leadership and organizational investment are linked to more evidence use by staff.
- Agencies that generate their own research evidence have the greatest effect on improved outcomes for children and families.

The policy implications for these findings are related to talent and workforce development, especially staff attitude, skills, and use of evidence. The results indicate that an investment in staff development—particularly around fostering positive attitudes about evidence and strengthening the ability to find and use evidence—would bolster the chances of success for families engaged in those programs. Supervisors can play a key role in supporting the use of evidence by front-line workers. *The recommendation I submit on behalf of the Alliance network is to invest in workforce development to lift skills, foster positive attitudes, and improve organizational culture to elevate the use of research evidence and promote positive outcomes for families.*

Evidence-based and informed practices need to be implemented within a research and development infrastructure that is equipped to support fidelity, quality service delivery, positive outcomes, and innovation.
Programs that implement evidence-based practices are less likely to achieve intended outcomes if the practice is not implemented with fidelity or if the context in which the program operates is not supportive. In other words, having an evidence-based practice is not a recipe for success.

Programs should be involved in continuous quality improvement evaluations, along with determining which practices can be proven to be effective at any given time. The American Public Human Services Association encourages public human service leaders to "invest in infrastructure capacities to scale up promising approaches and evidence-informed/evidence-based practices." [1] We should promote evidence-informed practices that improve outcomes while also ensuring that we don't get in the way of practical, low-cost supports that can make a big difference to a family's health and well-being.

---

[1] APHSA's 2016 Annual Report.

There is wisdom from the medical community that can be beneficial for the human services sector, especially child welfare, to consider. For example, medical professionals attend grand rounds, formal conferences in which experts present and discuss clinical issues intended to be educational for all participants. A child welfare version of grand rounds, where a specific case is presented and barriers identified, could be useful to social workers and leaders in the field. The medical community also has standards of care for medical conditions. Child welfare might consider developing standards of care for different types of abuse and neglect so that professionals know what steps to take and how to connect children and families to resources and other systems.

Organizations need to be innovation-driven. The Center on the Developing Child at Harvard University promotes an approach to innovation that takes risks, shares results early, and learns quickly from ideas that do not work[2]. When an organization rewards innovation, people can work together to test ideas and engage in active learning. These ideas should be grounded in the latest science available and informed by on-the-ground experience. The Center recommends working across sectors to test promising ideas, learn from failure, and promote fast-cycle sharing. It is critical that policy, funding, and professional environments support this type of experimentation and entrepreneurial investment in new ideas. *The recommendation is to invest in a research and development infrastructure that is equipped to support fidelity, quality service delivery, positive outcomes, and innovation.*

Conclusion
It is important to our sector that any changes being proposed to promote evidence-based policymaking will result in gains, not losses, for children, families, and communities. As we consider directing resources toward programs that produce outcomes, elevating our network's on-the-ground experience is essential. Legislative solutions must align the practice, policy, regulatory, and financial aspects of how we do our work in order to yield the best outcomes that all families deserve. Making sure that programs are operating in contexts that support the use of evidence, building the infrastructure and human capital for research evidence, and focusing on research and development investments are critical considerations for any policy about evidence-based practices.

It is a pleasure to share this testimony with you, and I look forward to hearing more about the Commission's findings in the coming months. I welcome any questions about my remarks.

Comments to the Commission on Evidence-Based Policymaking Opposing Lifting the Prohibition on a Student Unit Record System

Karen R. Effrem MD

President of Education Liberty Watch & Executive Director of the Florida Stop Common Core Coalition

The thousands of parent, grandparents, teachers, and citizen supporters across the nation of Education Liberty Watch and the Florida Stop Common Core Coalition, as well as many allied groups[1] representing hundreds of thousands more that have repeatedly raised student data privacy concerns, are firmly against the lifting of the prohibition on a federal student unit-record for many reasons. Here are a just a few:

- The government has no constitutional or moral right to collect data and offer it, without consent, to governmental and non-governmental organizations for research without consent. It is a blatant violation of the Fourth Amendment to the US Constitution and of the numerous Supreme Court precedents affirming parents' inherent right to direct the education and upbringing of their children as outlined in this letter from Liberty Counsel.[2]

- The Obama administration has already gutted the outdated and fairly weak data protections of Family Educational Rights and Privacy Act (FERPA) for K-12, allowing multiple federal agencies and outside researchers to have access to sensitive student and family data without parental consent.[3] Lifting the student unit-record prohibition will create a womb-to-tomb database of information that citizens will not be able to monitor themselves for any purpose, including to correct errors. Access to this data by so many entities will likely have life-altering consequences for the individual regarding college, jobs, military service, insurance, and other issues. Privacy expert Barmak Nassirian[4] said of this idea:

> "Tracking autonomous free individuals through most of their lives in the name of better information for the benefit of others may be justifiable, but its extremism should at the very least be acknowledged and addressed."

- There is abundant evidence from multiple federal[5] and state bills, from the National Assessment of Educational Progress (NAEP) effort to track mindsets and school climate data, from the National Commission on Social Emotional Learning,[6] from the new Head Start Performance Standards,[7] from policy efforts of foundations[8] and business groups,[9] etc. that there is a concerted effort to psychologically profile American students and workers starting at a very young age. This effort makes the plan to lift the prohibition on the student unit-record even more dangerous, very likely leading to the egregious violation of the most fundamental of American rights, the private right of conscience.

- We believe that student privacy and parental consent should always be considered pre-eminent compared to the research desires of the government or private sector, especially in the realm of psychological profiling.

- Congress and the rest of the federal government already ignore research that does not fit the paradigm of expanding the federal role in education and further usurping the parental role.   Disastrous federal welfare policies that subsidize unwed parenthood have resulted in terrible academic performance, more out-of-wedlock births, and increased rates of crime, drug abuse, suicide, etc. Multiple studies have shown that very few, if any, of the government programs designed to address these government-created problems – for example, school-improvement[10] early childhood,[11] or home visiting programs[12] -- have had significant sustainable benefit or reached their stated national goals.[13] According to data presented to the US House Education and Workforce Committee by the Cato Institute several years ago, federal involvement in education has yielded either stagnant or declining academic performance:

And often federal education programs have made things worse. But of course, the federal government simply disregards the research it disagrees with – and insists, through advocacy of a unit-record system, that it should be given even more data for even more research, which will be ignored if it reaches the "wrong" conclusions. The research of the esteemed co-chairman, Dr. Haskins, is an important example of this situation as he has authored several early-childhood studies, including analysis of Head Start[14] and Abecedarian,[15] and has seen first-hand the failure and or harm of these programs on poor children. Regardless of his views on lifting the prohibition on the creation of a student unit-record system, it is somewhat ironic that he is serving on this commission that is hearing so many pleas to expand access to more privacy-destroying data for more government programs.)

- The US Department of Education (USED) has terrible data-security:
  The US House Oversight and Government Accountability Committee chaired by Rep. Jason Chaffetz held two hearings dealing with the deplorable state of student data-security in USED. Here are some of its findings (emphasis added):

  At the **November 17, 2015** hearing,[16] the Committee learned that the US Department of Education:

[14] Dr. Haskins was on the Head Start Research Committee involved in Head Start Impact Study that showed very early fade out and harm to math skills of three year olds - https://www.acf.hhs.gov/sites/default/files/opre/hs_impact_study_final.pdf

[15] Dr. Haskins's study found that Abecedarian children were "more aggressive than children in the control group" in elementary school. http://www.jstor.org/stable/1129759?seq=1#page_scan_tab_contents

[16] https://oversight.house.gov/hearing/u-s-department-of-education-information-security-review/

o *Holds 139 million unique Social Security numbers*;

o *Continues to be "vulnerable to security threats"* according to the IG, and has repeat findings in annually required FISMA audits;

o *Failed to detect a penetration test of its systems conducted by the IG during its FY2015* [Federal Information Modernization Security Act]*;

o *Received an "F" on the Committee's FITARA scorecard*. [Federal Information Technology Acquisition Reform Act]

At the **February 2, 2016** hearing,[17] the Committee learned:

o *The Department of Education's (ED) Chief Information Officer (CIO) Danny Harris received substantial bonuses despite poor performance in securing IT systems at the Agency and significant ethical lapses in judgment.*

o Despite the IG's evidence to the contrary, Acting Secretary King asserted that Mr. Harris did not violate any law, regulation, policy, or standard of ethical conduct.

o Mr. Harris testified his home theatre installation and car detailing activities were "hobbies" and not businesses. The IG testified that these activities qualified as businesses.

o *It was in excess of two years before ED responded to the IG's initial report of findings and referral for administrative action.*

o The Department of Justice (DOJ) declined to prosecute the IG's criminal referral and deferred to ED leadership for action. Acting Sec. King deemed verbal counseling and a three page ethics guidance letter as appropriate consequences.

Does anyone really want psychosocial research and assessment results housed in the US Department of Education under these circumstances?

Perhaps most disturbing is the appearance of arrogant dismissal of citizens' privacy concerns by in this discussion during this Commission's meeting that occurred on December 13, 2016.[18]

A question asked by Commission member Bruce Meyer[19] to witness Ron Jarmin of the Census Bureau starting at 1:26:47:

"Let me try and ask what I think is a very difficult question, and I don't expect you to be able to answer it, but maybe we can start a conversation that could be useful to us. So, I see Census as having made a lot of steps to move in the kinds of directions that are suggested or anticipated by the Commission bill, in that you are working to bring data from other agencies or you have, into the RDCs — you've broadened their mission and you are bringing together data from many agencies and **allowing researchers in and outside of government to access the data that you've brought together. What are the ways that you could expand those efforts? Um, and I'm not suggesting that we talk about a single statistical agency across government, but how could there be more of a coordination or maybe a virtual one statistical agency** where *Census is playing a coordinating role*, or what kinds of movements in that direction should we think about? What kinds of things have you thought about? What are the barriers to moving towards more coordination between the statistical agencies?"

The response at 1:28:54 from the Mr. Jarmin:

"…One of the biggest constraints that everybody involved in this sort of endeavor faces is the different rules that are attached to data that are sourced from different agencies or different levels of, you know, whether

[19] https://www.cep.gov/commissioners/meyer.html

> it's federal or state… that if there was broad agreement in, that, you know, if there was one law that prosc–
> [sic – word not fully pronounced] had the confidentiality protections for broad classes of data, as opposed
> to, you know, here's **data with PII [personally identifiable information] on it that's collected from SSA,
> here's data with PII on it that's collected from the IRS; here's data with PII on it that's collected <u>from a
> state</u>;** versus from a statistical agency– if data with PII on it was treated the same, you know I think that
> would permit, you know, **organizations that were collecting PII-laden data for different purposes to make
> those data available more easily**. Now, that's probably a pretty heavy lift… to show people through
> examples like that, that there is not an explosion and the world keeps working, maybe even works better,
> um, **to do this in sort of baby steps showing by example, as opposed to trying to rip the Band-
> Aid off. I think ripping the band-aid would probably not fly."**

This attitude that all PII, no matter from where it comes, belongs to the federal agencies and corporate researchers, is extremely distasteful to American citizens,[20] especially for parents when it comes to womb-to-tomb education and health data about their children. This is especially true when one considers that this is advocated by the Census Bureau, whose only constitutional charge is to:

> *Representatives and direct Taxes shall be apportioned among the several States which may be included within this
> Union, according to their respective Numbers*…*The actual Enumeration* shall be made within three Years after the
> first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner
> as they shall by Law direct.[21]

We therefore strongly recommend the following for CEP and for Congress:
1. **Retain the prohibition of a student unit-record system.**
2. **Strongly consider a moratorium on further federal research until programs already shown to be ineffective and harmful are transformed or eliminated and until effective measures are actually implemented.**
3. **Prohibit social emotional data-gathering and the use of data for predictive testing in the FERPA and Strengthening Education Through Research Act (SETRA) reauthorizations.**
4. **Put in strict data-transparency language and update the data-security language per the recommendations of technical experts like Dr. Joel Reidenberg[22] or Barmak Nassirian[23] in any FERPA reauthorization.**
5. **Require third-party software and testing vendors to notify parents of what data is collected on students and how it is used.**
6. **Find a way for students whose identity and privacy is compromised to be compensated, in addition to penalizing researchers or private vendors that breach data-security.**
7. **Close the curriculum and assessment loophole for invasive surveys in the Protection of Pupil Rights Amendment.[24]**
8. **Demand that the US Department of Education immediately repair the federal data-security failures found in the Inspector General's recent report and uncovered by the House Oversight Committee.**

CHAPEL HILL, NC 27599-3435   maryann.feldman@unc.edu

MARYANN P. FELDMAN
S.K. Heninger Distinguished Professor

TESTIMONY

Before the
Commission on Evidence-Based Policy Making—Public Hearing
San Francisco, CA
February 9, 2017

Hello, my name is Maryann Feldman. I am a professor in the department of
Public Policy at the University of North Carolina, Chapel Hill.

I am speaking as a member of the community of scholars that seeks to
advance the scientific basis of science and innovation policy. My testimony
outlines some of the needs of that community related to 1) open science, (2)
ready access to administrative data, (3) rationalization of data access and use
polices, (4) the important for researchers to understand context or for them to
collaborate with practitioners, which also enhances trust, and finally (5)
offering suggestions for a governance structure for data access and use while
maintaining privacy.

My own research uses a variety of administrative data from public, private
and non-profit organizations at the local, state and national level. I am a
recipient of funding under the National Science Foundation (NSF) Science of
Science and Innovation Policy (SciSIP) program, which is part of the Division
of Social, Behavioral and Economic Sciences. The program funds research to
develop models, analytical tools, data and metrics that can be applied in the

science policy decision making process and affect the use and allocation of scarce scientific resources.

I am currently on detail to the NSF. The views expressed here do not necessarily represent the views of NSF or the U.S. Government. In my comments, I represent my own views as a researcher and member of the Science of Science Policy (SoSP) community of interdisciplinary researchers and policymakers, who seek to provide a scientifically rigorous basis for informing science policy.

The fundamental question that motivates the Science of Science and Innovation Policy community is, how can the United States use scarce scientific resources more efficiently and effectively to promote scientific and technological progress, economic development and economic growth. This research is empirical and relies on access to data.

It is only by studying the scientific research enterprise, the range of actors engaged in innovation and specific public programs and incentives that scholars can provide evidence to policy makers.

The United States conducts $456 billion of research and development (R&D) activity annually (NSF 2015). The Federal government, the second largest R&D funder behind business, invests $122 billion each year through the work of over 15 federal mission agencies (e.g., Department of Defense and Department of Health and Human Services) and 70 sub-agencies (e.g., the Defense Advanced Research Projects Agency and National Institutes of Health), as well as 15 independent agencies such as the National Aeronautics and Space Administration (NASA) and the National Science Foundation (NSF).

Understanding this diverse and dynamic system is a daunting task. Yet our ability to study and understand this field is greater now that it has ever been because of our ability to work with new digital data sources, and benefit from advances in research design and empirical methods. Progress for my community of scholars is dependent on access to administrative data. I applaud the mission of the Commission and want to be sure that the federal science agencies are included in your efforts to make administrative data available.[1]

I would like to offer three examples of projects that used administrative data to provide policy-relevant analysis. Federal agencies routinely publish information on funded projects yet access to all applications is rare. Access to administrative records enables analysis of differences between funded and non-funded projects and allows the construction of quasi-experimental research designs to better discern causal effects.

Each of these three projects I mention was conducted through special negotiated agreements that involved contracts or exceptions to gain access to proposal submissions. All have been published in top journals.

First, Ginther et al (2011) conducted the first systematic investigation of racial and ethnic differences in National Institutes of Health (NIH) funding, using 88,000 Research Project Grants (R01), which is the most common mechanism NIH uses to fund science. The NIH IMPAC II grant database provides applicant's self-identified race or ethnicity. Ginther et al (2011)

---

[1] There is utility to differentiating the difference between administrative data and scientific data. Administrative data capture agency processes, policies, and outcomes in pursuit of their mandated mission. In contrast, scientific data are the product of the agency's efforts.

found, after controlling for the applicant's educational background, country of origin, training, previous research awards, publication record, and employer characteristics, that black applicants were 10 percentage points less likely than whites to be awarded NIH research funding. Published in *Science*, this work was co-authored with Raynard Kington, former Deputy Director of the National Institutes of Health, and Walter Schaffer in the Office of the Director at NIH.

With this evidence, NIH Director Francis Collins, Ph.D., M.D., established the Working Group on Diversity in the Biomedical Research Workforce to develop effective strategies to recruit and promote the professional growth of underrepresented groups in biomedical research, from graduate study to granting of tenure. Based on the findings of the Working Group, NIH made a $500 million, ten-year commitment to improve diversity through

- Increasing the number of underrepresented minorities who study biomedicine (Building Infrastructure Leading to Diversity);
- Creating a national mentoring network (National Research Mentoring Network); and,
- Hiring a Chief Officer for Scientific Workforce Diversity.

Second, Lui and Agha (2015) examined the success of peer-review panels in predicting the future quality of proposed research using administrative data to track publication, citation, and patenting outcomes associated with more than 130,000 (R01) grants funded by the NIH from 1980 to 2008. Their analysis found that better peer-review scores are consistently associated with better research outcomes and that this relationship was robust even after accounting for an investigator's publication history, grant history, institutional affiliations, career stage, and degree types. A one–standard deviation worse peer-review score among awarded grants is associated with 15% fewer

citations, 7% fewer publications, 19% fewer high-impact publications, and 14% fewer follow-on patents. The results suggest that peer-review is doing a good job of picking projects. Further research can help program managers further refine the process.

Third, Sabrina Howell, in her dissertation and a forthcoming article in the *American Economic Review,* conducted the first large-sample, quasi-experimental evaluation of R&D subsidies using administrative data on ranked applicants to the U.S. Department of Energy's Small Business Innovation Research (SBIR) grant program. The results found that an early stage award approximately doubles the probability that a firm receives subsequent venture capital and has large, positive impacts on patenting and revenue, with stronger effects for more financially constrained firms. The results suggest that the SBIR program is accomplishing its objective: the results are not due to certification, where the award contains information about firm quality, but instead the SBIR program funds are used for technology prototyping, helping commercialize new ideas.

These readily accessible academic studies are in contrast to the often-used contract mechanism, which provides access to administrative data while limiting publication rights. Projects with limited publication rights are not useful for academic careers, thereby deterring academics from investing in such research. As a result, much of the analysis of these data is done by consultants, of varying quality and motives, conducting rather routine analyses, usually not employing the most advanced methods nor publishing the results in the peer-reviewed scientific journals.

These few examples demonstrate the need for ready access to administrative records to inform science policy and address the practices of federal

5

agencies. In these few studies researchers have negotiated access on an individual basis, overcoming each agency's own unique procedures for accessing non-funded proposals, reviewer and panel rankings, and administrative records, which include additional principal investigator characteristics, project monitoring data and outcomes information.

Imagine what might be possible if procedures for access to administrative data were streamlined making their use relatively painless. This would require amending the *Federal Information Security Management Act of 2002*, and subsequent updates, which provide the framework of information security standards for the federal government's information systems. One straightforward work around is to ask program applicants to provide informed consent to use their data for research purposes.

There are currently no standard procedures for researchers to gain access to federal science agency administrative data. The situation can be even more onerous for obtaining data from state and other publicly funded programs. Existing procedures for gaining access, where they exist, are time-consuming to navigate, difficult to understand and present barriers to the use of administrative data.   Certainly, removing legal barriers that limit access for the research community is a needed first step.

In my work with federal agencies, one of the things that surprised me was the great degree of heterogeneity. Each agency has its own policies and procedures for gaining access to administrative data. For example, NIH established internal policies to determine when data from their records management systems can be disclosed for research purposes.[2] NIH provides different levels of access depending on a researcher's role. Federal

---

[2] https://oma.od.nih.gov/forms/Privacy%20Documents/PAfiles/0036.htm

researchers can access data if they take yearly training in information security and privacy. NIH hosts a secure, encrypted environment that can be remotely accessed through a virtual private network. NIH staff who wish to access research grants data that are considered confidential and sensitive, such as unfunded grant proposals and reviewer rankings, require additional security background screenings. Personally identifiable information is highly restricted, often limited to a single person record at a time. If the need for expanded access to confidential and sensitive information arises, NIH staff can obtain a special data access agreement, which is limited to one-year duration. NIH staff can also sponsor a 'guest researcher' to obtain a data access agreement to access disaggregated awards data.[3] Sponsorship is at the discretion of NIH Institutes, Centers, and Offices. In most cases, these researchers have NIH grant support. External researchers are required to undergo the same clearances required for NIH staff. Researchers must request NIH clearance for any manuscript or presentations showcasing their work using NIH administrative data.

In contrast, many other federal agencies do not have specific policies or procedures in place to grant research access to administrative data. EPA and USDA participate in Census' FSRDC program, providing pollution abatement and food security population survey data, respectively.[4]

The Commission could strengthen efforts by developing overarching directives that coordinate and encourage data sharing with researchers across Federal agencies. One avenue for coordination and harmonization of agency policies and procedures is the Interagency Council for Statistical Policy. In addition, in October 2016, OMB released a notice of solicitation for

---

[3] NIH policy for the guest researcher appointment is available in NIH manual chapter 2300-308-1 at https://oma1.od.nih.gov/manualchapters/person/2300-308-1
[4] http://www.census.gov/about/adrm/fsrdc/federal_partners.html

comments on a new policy directive "Release and Dissemination of Statistical Products Produced by Federal Statistical Agencies."[5] Interagency dialogue and assessments could identify how statistical agency policy development could be adapted and adopted for Federal research award and other administrative data.

Another avenue for coordination and information sharing has been the Interagency Working Group on Science Policy, coordinated by the White House Office of Science and Technology Policy (OSTP) and NSF's SciSIP program. The primary function of this Group has been to identify opportunities to develop tools, theories, and methodologies that will advance their common interest, recommend joint research, data, and evaluation projects and enable Federal agencies to collaborate, coordinate, and leverage resources and efforts.

One question that the commission has asked about is alternative ways to share administrative data, providing access to researchers while guaranteeing confidentiality, privacy and data security. For the science agencies I would like to advocate for a decentralized system of agency specific data enclaves. There are three reasons.

First, there are many nuances to agency operations: the way programs are operated, data are collected, and even how variables are defined. Pece (2016) provides an overview of the challenges of obtaining reliable R&D data from federal agencies. Standardization is required in order to be able to make interagency comparisons. The National Center for Science and Engineering Statistics (NCSES) and the Office of Management and Budget

---

[5]

https://www.whitehouse.gov/sites/default/files/omb/inforeg/directive4/frn_comment_stat_policy_dir_4_addendum.pdf

(OMB) are working to establish a Federal R&D Community-of-Practice (R&D COP) to address agency questions on the interpretation of how to apply OECD Frascati manual. Adoption of standards would certainly reduce barriers to research using administrative data.

Second, my experience is that to best inform policy requires an understanding of context and the specific operation of the agency. The best efforts involve collaboration between academics and practitioners. Rather than simply taking data and conducting analysis there are many nuances and definitions to understand and appreciate and to make informed interpretations of the results.

Third, agencies have specific questions to address their mandate and to help them achieve their objectives. Policy relevant research projects are best-formulated and designed through interaction and collaboration. These interactions will benefit the scholarly community by providing more nuanced research questions and a deeper understanding the mechanisms that govern science funding and agency operations.

Some Science policy questions are universal across agencies but there are many hypothesis-driven studies that can be conducted using single agency data, perhaps linked to publications and patents. I think that there is plenty that we might say based on administrative records at the single science agencies. These would be questions about the effectiveness of different program interventions, selection processes and outcomes. Studies conducted at one agency can be replicated at other agencies.

Another opportunity is an expanded use of fellowships, and other temporary hiring authorities and mechanisms to bring in academic and other researchers

into agencies to access administrative data and conduct evaluations. Mechanisms to do this include the Schedule A excepted service authority and Intergovernmental Personnel Act.[6] The contract terms outline the access to program administrative data and analyses that the researcher would conduct. There seem to be various mechanisms in place across Federal agencies. Sharing these experiences across the Federal Government could provide a set of lessons learned to improve adoption and use.

I believe that a decentralized system allows for experimentation. Over time better practices will emerge and there will be more confidence in the relationships. This model would also create a dialogue between researchers and the policy community that is likely to increase trust on the part of the agencies and to provide researchers with more interesting and informed questions.

One question that I ask myself is if these administrative data need to be linked to other sources and what would those other sources be. Ultimately there is a hope that individual researchers can be tracked over their careers, however building such longitudinal data takes time. U-Metrics at the University of Michigan is one effort to accomplish this task. With greater familiarity with agency data, new questions emerge. A viable second phase could link agency administrative data with other records, such as those at the Census Federal Statistical Research Data Center (FSRDC). Indeed, Sabrina

---

[6] More on Schedule A available at https://www.opm.gov/policy-data-oversight/disability-employment/hiring/#url=Schedule-A-Hiring-Authority; the Intergovernmental Personnel Act Mobility Program provides for the temporary assignment of personnel between the Federal Government and state and local governments, colleges and universities, Indian tribal governments, federally funded research and development centers, and other eligible organizations, more information available at https://www.opm.gov/policy-data-oversight/hiring-information/intergovernment-personnel-act/

Howell has such a project underway to extend her EPA work by matching to applicant and other firms over time and working with the FSRDC.

Great work has been done at the FSRDC but if administrative data will be housed there then the Commission should address some of the current barriers and limitations. The application and vetting process is very lengthy and time consuming – unsuited to academic clocks which are short and tick loudly. Currently, proposals must demonstrate value to the Census Bureau under Title 13 of the US Code. That requirement might be too stringent considering there are many worthy projects that may not have direct value to the Census or another agency but might have great social value.

Currently, the federal agencies are working together to provide the data on funded projects to researchers and the public in a standard format for funded projects with the Federal RePORTER platform.[7] I invite you to take a look at this website and it's capabilities to query on topics across the participating agencies. There are negotiations to add other agencies. Indeed these efforts would be aided if the Commission could encourage or otherwise incentivize all the federal science agencies to provide their data.

Finally I would like to address something that I have noted that really concerns me and has potential to derail this undertaking. There is fear at many agencies that allowing researchers to work with their administrative records will reveal negative findings about the agencies. At a time when the federal science agencies feel under attack this is certainly understandable. But only by looking at data we can identify problems, bottlenecks and improve processes and efficiency. If we accept the premise that government programs are necessary to address market failures, facilitate network externalities,

---

[7] https://federalreporter.nih.gov/

reduce barriers to collaboration and take on fundamental projects that are beyond the scope of most American businesses, then innovation and American competitiveness can be improved. It is only by studying the scientific research enterprise, the range of actors engaged in innovation and specific public programs and incentives that can scholars provide evidence to policy makers.

Administrative data related to science and innovation policy cover a large number of administrative units beyond the federal agencies. At least one entity operates in each of the 50 states, with a mission of promoting innovation, entrepreneurship or science-based economic development. On top of this, consider all the activity in firms, research universities, institutes and labs and other non-profit and quasi-government organizations that have some stake in the outcomes related to science, scientific progress and commercial outcomes. Each has administrative data that could be studied to improve our understanding of the research and innovation enterprise. The federal effort in which the Commission is engaged can lead the way and set a model that states and other entities can follow.

Testimony to the Commission on Evidence-Based Policymaking
Building Evidence for Communities of Color and Integrating Data for Public Good

Submitted by Cynthia Guy, Ph.D., Vice President of Research, Evaluation, Evidence and Data
The Annie E. Casey Foundation
February 9, 2017

I.   Overview

Good morning/afternoon, Commissioners. Thank you for the opportunity to testify before you. I am delighted to be here because your mission is closely aligned with the Annie E. Casey Foundation's commitment to build a brighter future for millions of children at risk of poor educational, economic, social and health outcomes.

Today, I would like to share with you the Foundation's insights into using data and evidence to develop the best possible policies for those children and families. To get better results, all levels of government must allocate scarce resources to strategies that work. But too often, policymakers fund well-intentioned approaches that lack evidence of effectiveness and end up failing the children they seek to help.

Most social scientists agree that randomized controlled trials (RCTs) are the gold standard for classifying evidence-based programs. Yet researchers and policymakers also understand that RCTs can be conducted only in a very limited set of circumstances. And even when an RCT is feasible, the results may not be applicable to other people, places and contexts. Because of these limitations, the Foundation urges the use of best evidence available rather than solely relying on RCTs.

The Foundation supports evidence-based work carried out by professionals with backgrounds in education, health and child and adolescent development.

In my testimony, I would like to cover three areas. First, the data tell us clearly that children of color face the greatest obstacles to opportunity. Programs and strategies should therefore demonstrate success in communities of color, and we should develop a more diverse group of researchers to evaluate those efforts. Second, government should adopt integrated data systems to identify broad community trends and patterns and develop solutions to respond accordingly. And finally, I will discuss why policymakers cannot afford to lose the critical information gained through the U.S. Census, American Community Survey and Supplemental Poverty Measure.

II.   Using Evidence to Make Better Decisions for Communities of Color

Our nation is more of a quilt than a melting pot, so the traditions, social practices and cultural dynamics in communities of color have formed very differently over generations compared to those in predominantly white communities. They can also vary greatly from one community of color to the next. A program that works well in urban Chicago, for example, will likely have little relevance in a rural Native American community.

Yet the traditional approach to developing evidence-based programs and practices often does not incorporate the perspectives, experiences and input of communities of color. These programs are largely tested with primarily white trial groups and are created by an overwhelmingly white scientific community. By failing to appropriately consider children and

families of color, developers and researchers miss the opportunity to gain critical knowledge about what does and does not work in diverse settings.

A close look at the development of evidence-based programs for communities of color reveals three major themes: 1) an absence of adequate funding for rigorous impact evaluations of programs geared toward communities of color; 2) a lack of culturally specific and sensitive data collection approaches in evaluations; and 3) a dearth of evaluation professionals with adequate knowledge and training on the cultural issues facing these communities. Indeed, many evaluators and researchers are not well versed in community engagement and participatory research techniques that build trust and partnership within communities already wary of being research subjects. Investments to address these three themes will help minimize the gaps in evidence-based programs and practices for communities of color.

Increasing and engaging more researchers of color will enable human service providers to learn more about what works best in communities of color from people who are more intimately familiar with the intricacies of those communities. The Casey Foundation's Expanding the Bench initiative aims to increase the small but growing number of researchers and evaluators of color and to strengthen their influence in the field. Expanding the Bench provides networking opportunities that connect researchers of color with funders and supports professional development activities that place those researchers in leading evaluation centers and research firms. We encourage more efforts in this vein.

We have seen progress. Some evidence-based programs have emerged to support communities of color. Strong African American Families (SAAF), for example, helps rural African-American families strengthen their relationships, improve parenting and help young people develop. SAAF has included specific ways for parents to help young people cope with discrimination in response to research that exposure to racial discrimination is a strong predictor of preadolescent and adolescent depressive symptoms and substance abuse,.

SAAF was developed by child psychologist Gene Brody with a foundation of rigorous research. The program follows the standards of the National Institute of Mental Health prevention research cycle, which requires longitudinal, epidemiological research on target populations before developing prevention programs designed for them. For more than a decade, Brody and his colleagues at the University of Georgia's Center for Family Research have worked to identify protective factors that allow some rural African-American children in the state to thrive despite living in more challenging circumstances than their white peers.

Evaluations of SAAF showed several areas of statistically valid success. When compared with a control group, youth participants experienced fewer problem behaviors, such as theft, truancy or suspension. Those who didn't drink alcohol were less likely to begin drinking, and those who did increased their use at a significantly slower rate. The program also showed improvements in parenting, with increases in positive communication and in youth protective factors, such as negative attitudes about alcohol and sex. SAAF also delivered some unanticipated health benefits: Youth participants showed lower levels of stress hormones, inflammation and cellular aging.

Another program, Con Mi MADRE (Mothers And Daughters Raising Expectations), works with Latina mothers and daughters in Austin, Texas, to instill a shared vision of higher education and make that vision a reality. Con Mi MADRE provides tailored services to mothers and their daughters, from the child's sixth-grade year until she graduates from college. Services include personal visioning techniques, development of intergenerational communication skills, college visits and financial literacy education.

Con Mi MADRE is designed to take advantage of close family ties in Latino culture to build confidence in two generations simultaneously. Once moms develop these skills, every child and grandchild in their homes benefit. In a program that serves 750 children per year, 100 percent of the participants graduate from high school, and 77 percent go on to college. Of those who attend college, 54 percent persist and/or graduate, compared with a 15 percent college graduation rate for Latinas throughout central Texas.

Con Mi MADRE demonstrates the importance of taking culture into consideration. While cognitive behavioral therapy is probably one of the best-known clinical evidence-based practices, the organization found it to be less effective with its Latino families.

To develop additional evidence about the effectiveness of programs serving communities of color, it is essential to listen to the communities themselves. We can learn from organizations applying evidence-based practices in a culturally relevant way and use their experiences to enhance scientific knowledge about what works for children and families of color. We can also learn from many successful local programs that are not deemed evidence-based but are building proof of their effectiveness by engaging in research, by placing joint emphasis on qualitative and quantitative outcomes and by developing community-centered approaches. Such programs combine academic and community knowledge to deliver effective, culturally relevant solutions.

III. Promoting State and Local Integrated Data Systems

Through decades of work with child welfare, juvenile justice and other public systems, we have encountered numerous challenges and frustrations caused by the inability of government agencies to share information that can help children. We advocate the adoption of an integrated data system (IDS) to link individual-level administrative data from multiple government agencies. By linking records across agencies and over time, an IDS creates a rich picture of individual service needs, participation and outcomes over many years. In some cases, individual records are linked together to form comprehensive, long-term household and family histories. We believe it is important to develop these systems for state and local governments, both of which play key roles in the management and delivery of education and human services essential to child and family well-being. Facilitating and accelerating data-driven decisions across agencies will also enable them to respond more swiftly to address needs and issues as they arise.

The federal government has been an important partner in promoting IDS development at the state and local levels. The field has benefited from continued federal efforts to clarify and emphasize that privacy regulations such as the Health Insurance Portability and Accountability Act and Family Educational Rights and Privacy Act actually allow and encourage data integration among state and local public agencies. Also important has been the federal role in supporting the costs of state and local IDS development and encouraging comprehensive approaches to public systems planning and management that require cross-system data sharing. For example, the Office of Management and Budget has increasingly exercised leadership here, directing agencies to use a portion of their budget for low-cost evaluations using administrative data and issuing State System Interoperability and Integration Project grants to seven states in 2014.[1] More broadly, the federal government has mandated and

---

[1] See OMB-M-12-14. Grants were awarded to California, Colorado, Illinois, Indiana, Maryland, New York and Oklahoma, and interviewees confirmed their importance to IDS development in these states.

funded efforts to build longitudinal databases in every state with information on student achievement from early learning through workforce entry.

A significant number of state and local governments, as well as nonprofit and university partners under the governance of public agencies, already operate integrated data systems. By offering large sample sizes, longitudinal data and the ability to identify multiagency clients, an IDS is a valuable tool for policy analysis, program planning and monitoring and evaluation. Because of the sensitive nature of the data, organizations that house an IDS carefully follow privacy laws to protect the confidentiality of children and families, securely store data and maintain rigorous standards for use and access.

By using an IDS, states can understand whether their approaches are working or having unintended consequences for children. In Wisconsin, for example, child welfare workers and child support enforcement workers have routinely pursued child support orders to offset the cost of a child's out-of-home placement. But when researchers analyzed the administrative records in the state's IDS, they discovered this policy not only failed to recover costs but actually lengthened the time children spent in foster care. Acting on these findings, officials in the Department of Children and Families crafted a new policy. When it goes into effect, caseworkers will not collect child support from a parent during the first six months a child is in foster care and will apply new criteria in deciding to do so after that period.

An IDS can provide proof points to show a program is working and worth continuing. In Washington, for example, analysts used the state's IDS to evaluate the effectiveness of an innovative policy that reversed the typical practice of reducing or terminating Temporary Assistance for Needy Families (TANF) benefits when a child is removed from home and placed in care. Designed to speed family reunification by easing economic hardship, the new policy allows a parent to receive full TANF benefits for up to 180 days after a child enters care. The evaluation's positive findings on improving reunification rates without additional costs enabled state officials to keep the benefits in place.

Integrated data systems also advance two-generation approaches, which simultaneously address the needs of children and their parents so both can succeed. For example, the South Carolina IDS links inmate and household records (including use of mental health services, involvement with child welfare and juvenile justice systems, reliance on income support and student academic performance), which enables researchers to study the impact of incarceration on families. The state can use this information to improve family services and ease reentry.[2] In Oregon, the state's Center for Evidence-Based Policy used a combination of birth and parent records (from vital statistics, child welfare and programs related to self-sufficiency and substance abuse) to develop a model that predicts the likelihood of a child being maltreated by age 2 and placed in foster care by age 6. The data are geocoded down to the census-block level to create hot-spot maps that illustrate the prevalence of child maltreatment and foster care placement rates by location and are used to target preventive services to families.[3]

IV. Using Federal Data to Inform Better Decisions

Two of the most valuable data resources for the Casey Foundation and all practitioners of data-driven, evidence-based decision making are the decennial census and the American

---

[2] DeHart, D, & Shapiro, C. (2016). Integrated administrative data and criminal justice research. *American Journal of Criminal Justice,* 1–20. doi:10.1007/s12103-016-9355-5

[3] Actionable Intelligence for Social Policy interview with C. Kelleher in 2016, retrieved from www.aisp.upenn.edu/qa-with-christopher-kelleher

Community Survey. Both are currently at risk. Another key resource for providing accurate assessments of government programs designed to help families, especially those with children, is the Supplemental Poverty Measure.

No data resource is more fundamental to the operation of our federal system than the decennial census, which plays a key role in allocating political representation and federal funds. Despite the importance of ensuring a complete and accurate count in 2020, Congress has required the U.S. Census Bureau to hold the cost of the next census at the same level as the 2010 census, approximately $13 billion. This significant budget constraint will make it all but impossible to meet, let alone exceed, the precedent for accuracy set in 2010. Even within the constrained spending levels, the census has been bound up in the ongoing continuing resolutions for funding government. In most cases, this means level funding with the previous year. For the census, which has a planned schedule of increased appropriations as we near 2020 implementation, level funding translates into a significant cut. We hope the Commission would consider two recommendations: 1) an increase in spending for the 2020 census, and 2) either an approach outside the traditional appropriations process for funding the census or a commitment to avoid level funding through continuing resolutions.

While the census provides basic, once-a-decade numbers essential to government operations, the U.S. Census Bureau's American Community Survey (ACS) provides a rich body of continually updated social and economic indicators that the public, private and nonprofit sectors rely on to target and improve policies, programs and investment. For example, staff at the Casey Foundation analyze ACS data to provide accurate information on child well-being disaggregated by geography, income, race and many other factors. Our KIDS COUNT Data Center has 4 million data points, many of which are derived from analyses of the ACS. These data are important to public and private organizations that are developing evidence-based programs.

For example, Congress uses the ACS data to allocate grants for homeland security, highway planning and construction, Medicaid, substance abuse treatment, community development, rural electrification, public transit and dozens of other programs. Community leaders use ACS data to analyze the emerging needs of their neighborhoods; plan for the future; and locate new schools, recreational areas, hospitals and police and fire departments. Businesses use the data to make key marketing, site selection and workforce decisions. In recent years, there have been repeated efforts in Congress to undercut the ACS by making participation voluntary (a change that will reduce response rates and raise costs of data collection, according to Census Bureau tests and international experience) and by reducing or eliminating its funding. To maintain this fundamental data resource for evidence-based policymaking, we must defend the ACS against attempts to undermine the accuracy and reliability of the survey. We hope the Commission would oppose making the ACS voluntary by acknowledging that the ACS is the long form of the census and part of the constitutional obligation for enumeration, and we urge you to address the importance of funding the ACS.

In 2011, the U.S. Census Bureau created the Supplemental Poverty Measure (SPM) to provide a more accurate measurement of poverty than the official poverty measure reported. The SPM measures the impact of a number of programs such as the Supplemental Nutrition Assistance Program and Earned Income Tax Credit, and it accounts for rising costs and other changes that affect a family's budget. The measure has advanced the nation's understanding of child poverty and the effects of safety net programs and tax policies on families. By using the SPM, researchers have determined that the rate of children in poverty has declined since 1990, while the official measure shows almost no change. Data-based benchmarks and measures like the

SPM are essential tools for evidence-based policymaking, and federal policymakers should use and sustain them.

V. Lessons and Recommendations

Discovering what works to serve children and families, particularly in communities of color, and proving the efficacy of culturally relevant approaches are still very much works in progress. Questions of balance between scientific knowledge and community experiences are ongoing. However, those involved in the program examples described earlier share the following observations:

- Evidence is necessary for broader adoption and scaling. Whether or not a program is recognized as "evidence-based," the presence of compelling proof provides greater assurance that an investment in a program will indeed deliver the desired outcomes. However, creating that assurance requires significant investments of time and money on the part of program developers.

- Partnerships are key in developing evidence-based programs. Research institutions, universities and government research agencies such as the Agency for Healthcare Research and Quality all have experience with creating evidence-based protocols and securing funding for promising programs that seek to prove their efficacy. Partnering with those institutions can give small organizations a leg up in achieving evidence-based status.

- Culture is key. Programs that deliver great results for one group may not do so for another. Understanding culture and incorporating it into the creation of an evidence-based program will help ensure success in communities of color. In addition, understanding community culture will help create local support and buy-in during the research and pilot phases of an evidence-based program.

- **Evidence comes in multiple forms.** When examining cultural relevance, qualitative evidence is just as important as quantitative in terms of determining a program's efficacy and effectiveness.

- **Evidence-based research must respect community values.** Data collection processes must be sensitive to communities to avoid making people uncomfortable, especially in cultures that consider family matters private or have a deep distrust for outside organizations. By respecting community values, data may be collected with more fidelity and more comprehensively and can be used to inform stronger research design and more culturally competent methodology.

- **The federal government must continue to play an important role in promoting IDS development at the state and local levels.** It can do so by defining federal privacy regulations in ways that encourage cross-agency data integration, by helping support the costs of state and local IDS development and by encouraging comprehensive approaches to public systems planning and management that require cross-system data sharing.

- A complete count of the 2020 census, a mandatory American Community Survey and valid benchmarks of economic well-being such as the Supplemental Poverty Measure are essential to support data-driven decision making at every level of government. Federal policymakers should protect and sustain these data resources and tools.

VI. Resources to Help Employ Evidence-Based Programs and Practices and Promote Data-Driven Decision Making

"Implementation Research: A Synthesis of the Literature," by Dean L. Fixen, Sandra F. Naoom, Karen A. Blase, Robert M. Friedman, and Frances Wallace (University of South Florida, 2005) http://ctndisseminationlibrary.org/PDF/nirnmonograph.pdfhttp://ctndisseminationlibrary.org/PDF/nirnmonograph.pdf

"Evidence-Based Programs and Practices: What Does It All Mean?" by Lisa Williams-Taylor (Research Review, Children's Services Council of Palm Beach County, 2007)

California Reducing Disparities Project website.

National Evidence-Based Practice Databases

While these databases may not hold a significant number of evidence-based programs focused on communities of color, they may be helpful in providing useful general information such as definitions of different types of evidence-based practices.

The Social Work Policy Institute (www.socialworkpolicy.org/research/evidence-based-practice-2.html) lists the following databases and registries, among others:

Blueprints for Healthy Youth Development (Center for the Study and Prevention of Violence)

California Evidence-Based Clearinghouse for Child Welfare

National Registry of Evidence-Based Programs and Practices (Substance Abuse and Mental Health Services Administration)

Social Programs That Work

TESTIMONY

James J. Hill, Jr., EdD

CEO, Proofpoint.net

Los Altos, CA

Before the Commission on Evidence-Based Policy Making—Public Hearing

February 9, 2017

Abstract

Policy and program success requires four evidence-related factors: (1) effective goal setting, (2) accurate, yet speedy, issue analysis, (3) an impartial solution selection process, and (4) follow-through and reinforcement. However, having a robust and interconnected infrastructure and "Big Data" isn't the same as having "Big Evidence".

With just two weeks of observation of the new Administration, one theme seems to be emerging: A desire – maybe an insistence – for rapid actions that make a big impact.

So, while there are many long term considerations that the Commission can address, delivering two or three quick, ground level, wins will serve as a notable indicator of the bipartisan promise of the evidence-based law on which this Commission was founded.

Dr. Hill Biography

Dr. Jim Hill is the founder and CEO of Proofpoint Systems, a provider of cloud applications that advance evidence-based organizational performance. Since 2003, he has led Proofpoint in digitizing the processes associated with gap and root cause analysis; planning, execution, and evaluation; and fair talent management to help clients and consultants produce better and more cost effective results.

Prior to founding Proofpoint, Jim was a career officer in the United States Marine Corps and an executive with Sun Microsystems. He is also a past president of the International Society for Performance Improvement.

Jim's extensive writings consist of numerous articles and book chapters including the *Handbook of Human Performance Technology* (3d Ed., 2006) and *Performance Interventions* (1999). His book, *Giving Away Power*, was published in 2013.

Jim has been featured in *Training*, *Sales and Marketing Management*, *Japanese Management Journal*, and *BPTrends* for his visionary approach to organizational performance. Along with his clients and the organizations he has led, he is a 3-time finalist for the American Business Award (Best New Software Product), the recipient of the *Cyber*FEDS Awesome New Technology Award, and a 6-time recipient of the ISPI Award of Excellence. He is the 2016 recipient of ISPI's Distinguished Service Award.

Jim is a graduate of The Ohio State University and received his doctorate (human and organizational improvement) from the University of Southern California.

He and his wife, Aiko, have four children and reside in Los Altos, California where they are active in their community.

Written Statement for the
Commission on Evidence-based Policy-making

Proofpoint.net

Introduction and Overview

Chair Abraham, Chair Haskins, and Commissioners joining us virtually, I'm Jim Hill and I'm delighted to be here with you this morning.

Having reviewed early drafts of the legislation, I appreciate the opportunity to contribute.

As the CEO of Proofpoint.net, I represent a cloud technology that helps organizations solve their biggest issues faster and more cost effectively than ever before. That takes evidence.

What Leaders Want

Our experience is that leaders just want clear answers to five key questions:

1. Do our program priorities align with achievable objectives?
2. How do we responsibly audit, govern, and allocate resources?
3. Who are we contracted with and are they performing?
4. How well are we integrated?
5. How do we assess ongoing programs and new requirements?

I founded Proofpoint.net to help answer these questions. Timely, accurate, and unbiased information leads to better and faster decisions, improved performance, and accelerated organizational evolution.

Government Needs Practical Evidence Now

The question facing the Commission is simple, "How do we make government smarter with all the data floating around?"

However, multiple factors call for a major change in the way we think about work-related evidence. Beyond policy and technology considerations, there is a *social* aspect that must be considered. As examples:

- It's estimated that world data will grow 50x over the next 10 years[1]
- There is virtually no data related to day-to-day transactional work[2]
- Organizational improvement programs have about a 70% failure rate[3] and probably higher[4]
- With the growth of virtual work and expansion of BYOD, people want easier access to their work tools and data
- And, Big Data is not Big Evidence.

This issue is so wide-ranging, that it may be prudent to tackle it *in short term, low cost chunks* that align to desired decision cycles and what will likely be a high demand, resource constrained fiscal environment.

I'd like to highlight some examples and offer recommendations for quick wins that advance your goals.

Commission on Evidence-based Policy-making**

Proofpoint.net

Reference Case #1: Practical Program Monitoring

In 2013 a federal executive approached us with a problem: His staff was manually producing 80 daily and weekly reports.[5]

Little of the information they needed was in enterprise systems. Instead, it was in static documents and the heads of people.

So, rather than focus on planning and management, they were exchanging scores of emails and phone calls each day.

You can appreciate the inefficiency. You'll also sense that the millions of data points they were using and creating would never be available to others.

Nearly every federal program works this way. And, popular management applications don't help. They are designed for individual projects or, maybe, small groups. As a result, there is no effective way to bring thousands of projects or programs together.

This leads to my first recommendation to <u>pilot a common enterprise project management tool</u> in a willing department, agency, or program.

Doing so will demonstrate the power of capturing day-to-day transactional data that is now lost.

This recommendation is relevant to the Commission's charter in that it provides a use case for creating practices for monitoring programs and assessing their outcomes.

Reference Case #2: Simplifying Data Collection & Access

My second example begins with a recent report that more than 240 hospitals have been penalized three years in a row for infection-related issues. With an average penalty of $500K, [6] that is more than one-third of a billion dollars wasted.

In a related event, I recently visited a notable acute care facility where I was shown two walls covered in 8 ½ x 11 sheets of paper.[7] Each sheet contained a graph that staff members were assigned to manually update each day – using a marker.

At the end of each month, the graphs were filed away.

While hospitals spend many millions on electronic health records, patient informatics, and bill collection technologies, healthcare administration is nearly all done via paper, spreadsheets, and white boards – and it's a massive vulnerability to the Nation's health.

So, my second recommendation to <u>pilot a common quality management tool</u> with a willing healthcare system.

This will lead to better patient outcomes and reduced readmissions. It will also cut administrative time, increase staff morale, and reduce turnover.

This recommendation aligns to your charter by eliminating barriers to accessing data that organizations already collect. In this case, the collection effort is so manual that the data will never get used by the right people or at the right scale.

Proofpoint.net

A Final Thought & Recommendation

My final comment is that data access and exchange are not technically hard. They are simply electronic handshakes.

But the barriers are enormous. Beyond longstanding policies, on the vendor side the core philosophy of your major providers is to intentionally not integrate, or to do so at great expense.

However, the "social" side of evidence exchange presents an opportunity. Make it personal.

So, I recommend the establishment of a federal "Goal Repository," starting with a pilot program that rewards participation.

The Goal Repository would use interpersonal sharing to drive interagency sharing. It would cultivate thinking along the lines of, "This is what I'm trying to do (goals). I wonder if anyone else is working on a similar issue." Leaders would connect and share information of mutual value based on mutual interests.

Conclusion

Finally, in your report to the President and Congress, I urge the Commission to recommend an approach characterized by "low cost immediacy."

Addressing the issue via multiple, successful, pilots will produce frameworks that others can easily adopt. That will result in speed, cost efficiency, and improved productivity at every level of government.

Statement submitted to the Commission on Evidence-based Policymaking
Public Meeting, February 9, 2017
San Francisco, CA

Submitted by: David S. Johnson, Research Professor and Director of the Panel Study of Income Dynamics, University of Michigan[1]
Co-signers: Rebecca Blank (University of Wisconsin – Madison), Sheldon Danziger (Russell Sage Foundation), Kathryn Edin (Johns Hopkins University), Irv Garfinkel (Columbia University), David Grusky (Stanford University), Michael Laracy (Annie E. Casey Foundation), Luke Shaefer (University of Michigan), Timothy Smeeding (University of Wisconsin – Madison), Laura Speer (Annie E. Casey Foundation), Jane Waldfogel (Columbia University), Renee Wilson-Simmons (National Center for Children in Poverty, Director), Christopher Wimer (Columbia University), James P. Ziliak (University of Kentucky)

The timing for a bipartisan commission on developing evidence-based policymaking is almost prescient. Many of us have been involved with the process of creating this commission, and we thank Speaker Paul Ryan and Senator Patty Murray, Chair Katharine Abraham, Co-Chair Ron Haskins and all of the Commissioners on their work and dedication to this important goal – "*...developing a bipartisan strategy to ensure that evidence increasingly informs the important decisions that affect the lives of Americans.*"

Our purpose in this statement is to focus on three points:
- Support and independence must be provided to the federal statistical agencies to "*improve statistical protocols*" for producing timely, accurate and relevant statistics, specifically, the Supplemental Poverty Measure (SPM).
- Support must be provided to statistical agencies for the continued production of the SPM, as it is the only official statistic that measures the effectiveness of government tax, transfer, and social insurance programs.
- Support must be provided to construct a data infrastructure that facilitates linkages between survey and administrative data, which can be used to improve the SPM.

Our request is slightly different than many of the other statements to the Commission. We focus on the Commission goals related to improving statistical data series and statistical protocols as described in the Commission's charge.[2] These common protocols and commonly accepted statistical indicators are critical. As Katherine Wallman, the recent Chief Statistician of the U.S., stated in last week's Guardian article (Chalabi (2017)), "*We should all be starting from the same*

---

[2] *"(1) determine the optimal arrangement for which administrative data on Federal programs and tax expenditures, survey data, **and related statistical data series** may be integrated and made available to facilitate program evaluation, continuous improvement, policy-relevant research, and cost-benefit analyses by qualified researchers and institutions while weighing how integration might lead to the intentional or unintentional access, breach, or release of personally-identifiable information or records; (2) make recommendations on how data infrastructure, database security, and **statistical protocols** should be modified to best fulfill the objectives identified in paragraph (1)."*

numbers. I think that's a fear that many of us have at this point - it's that picking and choosing your numbers to suit your politics is not the way that we ought to be doing it."

Importance of Federal Statistics

The white paper presented to the Commission as background, "Using Administrative and Survey Data to Build Evidence,"[3] stressed the importance of the foundational evidence represented in aggregate indicators as one key component of evidence-based information; the SPM and the Principal Federal Economic Indicators (PFEI) are key foundational evidence. The other white paper, "Overview of Federal Evidence-Building Efforts," describes the responsibilities of statistical agencies, which include producing reliable data, accurate and objective statistics, and protecting. Without a statistical system that can work in this framework, the task of building a data infrastructure to improve statistics will be difficult, if not, impossible.

The country's need for reliable and trustworthy statistics on the economic well-being of the nation is critical. This can only be accomplished with official statistics, government survey collection,[4] and data integration with government administrative data. In fact, the recent National Academies of Science's Committee on National Statistics report (Groves and Harris-Kojetin, 2017) states it best – **"***Federal statistics provide critical information to the country and serve a key role in a democracy*.**"**

The need for reliable and trustworthy statistics are summarized in a variety of Statistical Policy Directives issued by OMB, and in a sense, provide guidelines for the statistical protocols used in the statistical system. Statistical Policy Directive 1 ensures the quality and independence of the statistical agencies. Statistical Policy Directives 3 and 4 provide guidance in the dissemination of the principle federal economic indicators, and other important foundational evidence.

The Importance of Poverty and the SPM

The poverty measure has an elevated distinction as recognized by OMB Statistical Policy Directive 14. Even before these important directives (1, 3 and 4) were issued by OMB, Statistical Policy Directive 14 (released in 1978) instructed the Census Bureau to produce an official poverty measure, and stated: "*Other measures of poverty may be developed for particular research purposes*." It is essential that a poverty measure reveals the effect of major income support programs designed to aid the poor. Many such programs, however, are excluded from the official poverty measure. Such programs include housing supports, major food and nutrition programs, and refundable tax credits. Only the SPM can provide evidence on these major social programs.

Because the official poverty measure does not account for any of the government tax and in-kind transfer programs, it does not provide an accurate view of the financial status of low-income

[4] See Joe Hotz's statement to the CEP on Jan 5, 2017, where he stresses the importance of government survey data.

people. It only includes direct cash social insurance (e.g. Social Security and Unemployment Insurance) and welfare (e.g. Temporary Assistance for Needy Families and Supplemental Security Income) programs. As such, any changes in benefits from the Supplemental Nutrition Assistance Programs (food stamps) or tax credits like the Earned Income Tax Credit and Additional Child Tax Credit will have no direct impact on the poverty rate, even though outlays on these programs far surpass those of the means-tested cash transfer programs. In addition, the official poverty threshold, the dollar amount such that families with income below it are poor, was based on food spending in the 1960s, updated with inflation until today. But housing today, not food, is the single largest element of households' budgets. The official thresholds are also the same for San Francisco and Merced, and New York City and rural Mississippi. Finally, the official poverty measure does not account for the income sharing between a single parent and a live-in partner – they could both be poor under the official measure even though they live together and share resources.

The SPM has been developed over the past 25 years with bipartisan participation by researchers and policymakers, and remedies the flaws in the official poverty measure. The main impetus for the new measure arose out of the National Academy of Sciences report, Measuring Poverty: A New Approach, released in 1995. In this report, a bipartisan and distinguished group of academics and researchers (Rebecca Blank and Sheldon Danziger, both co-signers today, were members of the panel) agreed on recommendations for a new method to measure poverty in America. This new measure has been examined by many bipartisan groups, including meetings at The Brookings Institution, American Enterprise Institution, and Wisconsin's Institute for Research on Poverty. All along the process, these discussions were guided by the direct involvement and continued research at the federal agencies, especially BLS, Census and OMB.

Three events solidified the support for an SPM measure – Rebecca Blank's Presidential Address at APPAM that suggested that the new measure be a supplement for, and not a replacement of, the official poverty measure; Mayor Bloomberg's call for the Center for Economic Opportunity to produce an alternative poverty measure to provide more accurate evidence for NYC; and the proposed Congressional legislation, the Measuring American Poverty Act. These activities centered the discussion on using a common supplemental poverty measure in conjunction with the official measure.

Finally, in 2010, the President proposed funding for the SPM in the 2011 Budget, and OMB issued guidance via the Interagency Technical Working Group. The detailed Department of Commerce congressional budget stressed the importance of the new measure for evidence-based policymaking stating: "*A more accurate measure of poverty will provide policymakers with more accurate information for modeling changes to their programs and improving the evaluation of the effectiveness of programs for the disadvantaged. Poverty is a critical indicator of how widely prosperity is shared in our economy and is a benchmark for targeting resources toward the disadvantaged.*"[5]

The SPM is much more accurate than the current official poverty measure, which has been basically unchanged since its inception in 1968. Even Adam Smith realized the importance of defining poverty in terms of the conditions of the day "…*a creditable day-laborer would be*

---

[5] See http://www.osec.doc.gov/bmi/budget/11CJ/Census%2011%20portrait%20final.pdf

ashamed to appear in public without a linen shirt, the want of which would be supposed to denote that disgraceful degree of poverty..." Yet the official poverty thresholds are based on food costs from the 1960s.

Unlike the official measure, the SPM thresholds are updated to reflect a current basket of necessities (based on food, clothing, shelter and utilities), different thresholds are created for different living arrangements, for renters vs owners, and for differences in the cost of living across geographic areas.[6] Poverty is determined by combining all of the income from spouses and cohabiting partners and includes all children, as opposed to the official measure. As mentioned earlier, income includes not just cash income but also the value of government in-kind transfers as well as tax credits (and tax payments). Finally, the market basket continues to relevant for the current period.

In addition to a much more inclusive definition of resources, the SPM also takes into account the increasing costs of health care and child care and work-related expenses. As such, it is definitely a "*more accurate measure of poverty"* as stated in the Commerce Department budget (mentioned above). Because the SPM is annually published by the federal statistical agencies,[7] it represents a critical component of the foundational evidence required to determining the effectiveness of policy.

The SPM also changes our perception of the poor – who they are. Due to the inclusion of in-kind transfers and refundable tax credits, children and single parent families are a smaller fraction of the poor. With child care and work-related expenses, workers are a larger share of the poor under the SPM, as well as families spending on private health insurance. The SPM demonstrates that people living in poverty are not just those without any income. Just as Adam Smith recognized, it takes more to live in today's society.

As Speaker Ryan (when he was chair of the House Budget Committee) stated in his budget document, "Economic Opportunity in America," July 2014,[8] (where he introduced the concept of the Commission), "*The first task is to determine how we should define progress*," and he continued by suggesting that the official poverty measure was flawed, and that the SPM would better measure the progress of poverty, and even stating, "*Using more comprehensive poverty measures strengthens this case. Using the SPM, Wimer et al show that child poverty plummeted beginning in 1994*."[9]

Since its inception in 2010,[10] there has been extensive research using the SPM to evaluate government programs. The 2014 Economic Report of the President highlighted the SPM in their chapter on the War on Poverty to demonstrate that with government programs we have not lost the War on Poverty as the flat trend of the official poverty measure suggests. In addition, the bipartisan report, "Opportunity, Responsibility and Security: A Consensus Plan for Reducing Poverty and Restoring the American Dream," (on which Ron Haskins was a coauthor)

[9] See also Winship (2014) for support for using the SPM.

[10] Short (2011) is the first official report that produces an SPM.

highlighted the SPM as the preferred poverty measure, by a wide spectrum of policy researchers, in evaluating the trends in poverty and the impact of government tax and transfer programs. The attached reference list shows many papers that examine the impact of the SPM on the poverty rates of a variety of demographic groups, including the official publications at the Census Bureau and BLS.

Recent research shows that only in using the SPM can we measure the impact of public policy. For example, Bitler, Hoynes and Kuka (2016) demonstrate the impact on child poverty reduction from the social safety net using an SPM-like measure, and Wight, Kashal and Waldfogel (2014) show that the SPM finds impacts on very low food security for children.

Finally, some of the most important work that uses the SPM, in conjunction with the American Community Survey, to measure the effectiveness of government programs has been conducted at the state and local levels. The Center for Economic Opportunity in NYC has led the way on developing an SPM for NYC. In fact, Mayor DeBlasio initiated the OneNYC project that includes poverty reduction goals using their SPM.[11] For example, NYC has also used the SPM to evaluate the effects on poverty for workers negotiating wage contracts and to inform the Mayor's housing policy on annual rent changes in regulated units.

Wisconsin and California also have state-specific SPMs, which are used to determine effectiveness of state-specific polices like state-level EITC and child care. For example, in California the state level SPM has been used to evaluate the expansion of the California EITC, showing that this expansion will "…*increase the resources of a substantial number of Californians living in poverty and deep poverty.*"[12] Oregon and Minnesota have worked to develop measures, the Urban Institute has initiated a number of projects with states (Minnesota, Connecticut, Georgia, Illinois, and Massachusetts), and the Center on Poverty and Social Policy at Columbia University provides the SPM for all states.[13]

Importance of Administrative and Survey Data Linkages

The SPM is well-positioned to be an example of an economic indicator that integrates survey and administrative data, while highlighting the importance of the new data infrastructure. All of the state-level SPMs already adjust their estimates using the state-level administrative data on program participation to ensure that the aggregate benefits in the survey match the state totals (e.g., SNAP and housing). The Urban Institute's TRIM model has been using integrated data to model improved estimates of SNAP and TANF in the SPM (see CBPP).

It is widely known that the government surveys do not completely account for all government transfer programs; many respondents mis-report or under-report their benefits. Recent research by Meyer, Mok and Sullivan (2015) documents this for a variety of surveys, especially the amounts of income from government transfer programs.

---

[11] See also Matthew Klein's statement to the CEP on Nov 4, 2016
[12] See http://inequality.stanford.edu/sites/default/files/EITC-california.pdf
[13] See https://www.povertycenter.columbia.edu/data-release/2016/8/23/historical-spm-data

Meyer and Mittag (2015) demonstrate that the under-reporting for SNAP creates a downward bias in the estimate of the poverty reduction impact of SNAP. Integrating the administrative data on SNAP with the survey data on other income shows that SNAP is much more effective at reducing poverty than shown in uncorrected survey data. Hence, this data infrastructure with all State-level SNAP benefits (and other programs such as WIC and TANF) will provide much better foundational evidence on the effectiveness of these programs.

Alternatively, Hokayem, Bollinger and Ziliak (2015) show that earnings are over-reported for low income families in the surveys as compared to their earnings records at IRS and SSA. By integrating survey and administrative data, they demonstrate that poverty is higher than shown in the official measure, suggesting such a correction would similarly show higher poverty in the SPM. Hence data infrastructure that included administrative earnings and income data would improve the estimates provided by the SPM.

Because of this under-reporting and measurement error in income surveys, some researchers suggest that using a consumption-based measure of poverty may be more accurate (see Meyer and Sullivan, 2012). While multiple poverty measures would help to assess the poverty trends and composition of the poor, the SPM is currently the only official measure that can account for the impact of government programs on a timely basis. Hence, we believe that the focus should be on improving the measure of income in the SPM. This is also supported in the recent legislation proposed by Senator Mike Lee, the Poverty Measurement Improvement Act, which recommends the data linkages necessary to obtain an improved measure of resources. As a result, building on the current data infrastructure that exists in the federal statistical agencies is the best method to further statistical protocols and highlight the SPM as critical foundational evidence.

Recommendations

We recommend that the Commission's report include a statement that OMB should continue support and funding to Census and BLS to produce the SPM alongside the official poverty measure.

We recommend that the Commission's report encourage statistical agencies to use the integration of survey and administrative data to improve the measure of resources and thresholds in the SPM, and in national statistics more generally.

We recommend that the Commission's report include a statement supporting statistical analysis and research at statistical agencies.

RTI International

RTI International is an independent, nonprofit institute whose mission is to improve the human condition by turning knowledge into practice. RTI staff are experts in education data from system development to data collection, linking, analysis, reporting, communication, and use, and including administrative and survey data at both the K12 and postsecondary education levels.

Submitted to the Commission on Evidence-Based Policymaking (CEP)
January 24, 2017

Introduction

US education is an enormous enterprise facing daunting educational challenges. Practitioners, policymakers, researchers, parents, and other stakeholders seek evidence-based strategies for improving student outcomes. In this brief we describe several important opportunities for strengthening state and federal education data to help improve K12 and postsecondary education programs.

State Education Data and Evidence

Important Data Differences

Some federally funded programs that are administered at the state and local levels—such as unemployment insurance and the Supplemental Nutrition Assistance Program (SNAP)—collect standardized individual-level data, which are reported to the relevant federal agencies. While K12 education is also administered at the state and local levels (with some federal funding), state and local education data systems vary widely and, in addition to being used for state and local purposes, report aggregate data only to the US Department of Education (USED).

Federal Investments in State Education Data

Historically, state education agencies collected aggregate administrative and performance data from school districts for state and federal reporting purposes. After *No Child Left Behind* was enacted in 2001, most states began building student-level longitudinal data systems to track individual student performance over time. Since 2006, USED has awarded six rounds of competitive grants to states to support the development, building, securing, and use of these statewide longitudinal data systems (SLDSs). Early grants focused on building K through 12 data systems and states have increasingly been able to collect and link the following at the student level:

- demographics, disabilities, and behavior
- courses, tests, and grades
- assigned teachers' qualifications and experience
- participation in career and technical education, gifted programs, etc.
- K12 outcomes such as high school graduation and college readiness
- school climate survey data and social emotional learning data

Subsequent SLDS grants focused on integrating data from additional sectors, including early childhood education, postsecondary education, and workforce. Additional federal grants (USDOL Workforce Data Quality Initiative and USDHHS early childhood learning) have also helped to expand SLDSs beyond K12 to P20W+ data systems, covering the complete pipeline from early learning through postsecondary and workforce preparation and outcomes, and including nontraditional paths through adult education.

Turning Data into Evidence

Student-level longitudinal data make it possible for educators, policymakers, researchers, and even parents and students to understand the factors that are associated with better outcomes as students transition to the next education level or into the workforce, including improved learning; persistence, promotion, and completion; and labor market success. These data can help to determine predictors of positive outcomes, develop early warning tools, and identify effective programs and practices.

In addition to addressing state and local information needs, SLDSs can support federal evidence requirements. The new Every Student Succeeds Act, Workforce Innovation and Opportunity Act, and Education Department General Administrative Regulations now require state and local agencies and awardees to link cross-sector data and to propose, develop, and use an evidence base for federally funded programs. The new grant evidence categories encompass traditional causal studies, such as RCTs and quasi-experiments, as well as well-designed correlational studies, all of which can be informed by SLDS data.

States and districts have developed sophisticated and secure data systems that link cross-sector data and offer access under the relevant federal, state, and district privacy laws. However, more support is needed to develop new administrative data science methods that produce credible evidence and to encourage appropriate use of the data and evidence to inform policy and practice.

Recommendations

We recommend that CEP:
1. Encourage continued federal investment in the development and use of SLDSs; and

2. Promote development of administrative data science methods that produce sound and accessible correlational, quasi-experimental, and causal evidence.

Developing these systems and methods will simultaneously help to meet federal, state, and local demands for evidence of effective education practices, programs, and policies.

Federal Education Data and Guidance

RTI is a member of the Postsecondary Data (PostsecData) Collaborative, which made several recommendations in comments provided to CEP in November. Below, we develop several of these recommendations further.

1. Make recommendations that address the administrative and legal barriers to data linking and access.

Administrative data, when de-identified and linked appropriately, can provide important context for understanding the education landscape. Understandably, access to Internal Revenue Service (IRS) and Social Security Administration (SSA) data is highly controlled for privacy and security reasons. However, as the recent release of Raj Chetty's paper, *Mobility Report Cards: The Role of Colleges in Intergenerational Mobility,* shows, linked data can be handled properly and enable new analyses that cannot be undertaken using currently available data such as the institution-level Integrated Postsecondary Education Data System (IPEDS) or the National Center for Education Statistics' sample surveys.

While IPEDS and the sample surveys are important sources of data, each has its limitations. IPEDS can only be used to explore differences at the institution level and does not, for example, currently collect detailed outcomes on all student populations. Because these data are not student level, they cannot be merged with other data that could provide the missing student characteristics. Further, while a useful source of student-level education data, the National Postsecondary Student Aid Study, Beginning Postsecondary Students Longitudinal Study, and Baccalaureate and Beyond Longitudinal Study are constrained by their sampling designs. Because they are nationally representative, but not state representative in most cases, these surveys cannot currently be used to make comparisons across or within states, despite a growing interest in making such comparisons.

The Western Interstate Commission for Higher Education Multistate Longitudinal Data Exchange, the Southern Regional Education Board State Data Exchange, and the University Innovation Alliance are examples of individual states and institutions agreeing to share data with a common goal of understanding the enrollment and completion patterns of students and improving student outcomes. By recommending actions to simplify the sharing and comparing of data across states, the Commission can signal its support of these existing agreements and encourage other states to explore similar agreements.

3

2. Align definitions and metrics across federal laws.

Establishing common definitions for data metrics across federal laws would reduce administrative burden and create comparable outcome measures across federal programs. Federal laws such as the Higher Education Act, the Workforce Innovation and Opportunity Act (WIOA), the Perkins Career and Technical Education Act, and the Elementary and Secondary Education Act contain similar metrics that could be streamlined. While these recommendations require Congressional action, consistent definitions can cut costs and reduce security risks by minimizing the number of redundant data collections across the federal government. The Commission can recommend a legal framework that uses the proposed national clearinghouse to align metrics around:
*   student enrollment rates in colleges and programs
*   college readiness
*   college and program completion
*   employment rate or job placement rate
*   earnings
*   credential attainment

Aligning metrics across federal agencies would streamline existing reporting and allow consumers to make informed decisions about programs that span agencies. Standard definitions would also create opportunities to combine and expand data dashboards and reporting for additional purposes such as consumer information and regulatory compliance. For example, the College Scorecard could include data from DOL's WIOA reporting in order to show training program outcomes and serve as a resource for students to understand outcomes for different career pathways.

Source: Adapted from PostsecData Collaborative November 14, 2016 comments to the Commission.

3. Leverage existing data to decrease burden, streamline reporting, and answer critical stakeholder questions.

Existing administrative data can help policymakers, institutions, and students answer critical questions about postsecondary access, success, post-college outcomes, and affordability, such as:
o   How many low-income, Pell Grant-recipient, first-generation, veteran, adult, transfer, and part-time students—who make up the new majority on today's campuses—attend each college? Do these students graduate?
o   How long does it take students, particularly those who enter college with less academic preparation or fewer financial resources, to complete college?
o   Do students who don't graduate transfer—or do they drop out?
o   How much money do different types of students borrow for college and how do their repayment outcomes vary?

    o   Can students find jobs in their chosen field and how much do they earn?

Data from the USED, SSA, Department of Defense (DoD), and Department of Veterans Affairs (VA) provide valuable information on important subgroups of students who are often overlooked, including Pell Grant recipients, student loan borrowers, and student veterans. For example, SSA and IRS tax records have, in limited instances, been used to report employment and earnings outcomes at the program level to better understand students' workforce outcomes. USED's IPEDS and National Student Loan Data System include information on financial aid and student access and success that can be disaggregated to examine progress for student subpopulations. DoD and VA, which house data on student veterans, financial aid, and recruiting, can be used to answer these questions specifically for the veteran population. Linking these data sources can reveal opportunities to eliminate duplicative data collections and decrease reporting burden on data providers.

RTI recognizes the importance of limiting data collections to those metrics that have a specific and valuable purpose in meeting administrative, policymaking, and research needs. These data collections should also include a robust reporting function, returning data back to colleges and programs for benchmarking and improvement purposes and to add value for the data providers. Any clearinghouse or data system solution that is considered by the Commission should focus on answering critical questions about student outcomes; balancing reporting burden with analytic value; and including outcomes data on employment and earnings for all students, at all postsecondary levels and in workforce programs.

5

At the October 21st CEP hearing, Emmet McGroarty of the American Principles Project was the only testimony at the hearing opposing the continuation or increase of federal collection of individual student data. Mr. McGroarty is not the only man or woman in America that opposes the federal unit record system of student data. Grassroots organizations, made up of highly skilled, organized and well-researched individuals are also fighting to protect our children and grandchildren. The pushback on data collection is vigorous and we won't stop until we have a victory.

Numerous experts are seeking to repeal the prohibition in the current Higher Ed Act Section 134 against a federal student-unit record system that would collect personally identifiable information on higher education students and link education data to workforce data. I stand with Mr. McGroarty in asking that the protective barrier to government intrusion into citizen's private lives remain intact.

This United Commission report to the President and Congress required by the law, is considering how the integration of data "might lead to the intentional or unintentional access/breach, or release of personally identifiable information or records." This is a very serious question for the Commission to answer. The Commission is also faced with the question of whether the government even has the right to collect such personal data.

States were incentivized to create massive databases in 2002, allowing more than just the collection of academic performance and biographical information on individual students in K-12, as well as higher education. Prior to this, the law prohibited the collection of PII such as disciplinary history, social emotional development and extra curricular activities of individual students at the federal level. However, Obama's gutting of FERPA in 2012 now means that government education officials now have the freedom to disclose a student's PII without parental consent.

Mr. McGroarty also presented this profound statement to the Commission on Evidence Based Policymaking: *"Such databases make freeborn American citizens objects of research and study. It assumes that the goal of benefiting others in society justifies the powerful federal government collecting and disseminating millions of data points on individuals often without their expressed consent. This fundamentally changes the relationship between the individual and government. Our republic rests on the idea that the citizens control the government. That cannot truly happen when government sits in the position of intimidation over the individual."*

Having the government know the state of your social and emotional development, along with data from other data sets, like medical records that the Commission is considering, is very disturbing. The Commission is focused on the

collection of data from higher education for consumer benefit and workforce planning. It would be one thing for colleges and universities to voluntarily create a private association that collected the kind of data the feds are considering in order to provide them with the data to back their marketing claims. However, the Commission is looking at having the data collected by the government.

The very thought of such data collection reveals the current state of affairs for higher education. The image of the modern university is rapidly declining from one where people with intellectual ability go to pursue an even more learned understanding of a subject, towards one of a business in competition with other businesses offering an ever-expanding menu to try to eek out additional market share. According to the government, the consumer (student) could use such data collected by a private association, policed by industry competitors to make sure it is accurate, to choose which business (university) to attend or not attend if they did not wish to be part of such data collection. The act of collecting this data by government order takes that choice away from students and can use the coercive power of law to force them to provide their PII to an entity which is not even part of this business sector.

I ask the Commission to consider whether the government can create a data clearinghouse and whether it can be self-funding. I am urging the following if such a clearinghouse is created:

1. The government must collect only aggregate data, not personally identifiable information.
2. Parents and students must have the ability to review and correct records and notice as to who can see those records.
3. If such a database is created, it should be funded through the general treasury, because this gets at the heart of the decay existent in public private partnerships.

The law only considers the cost of the work of maintaining such a database and looks for a return of investment. Such a data system will have the intimidating power of government behind it. The creation of self-funded enterprises removes an important check that the congress provides. Checks and balances are so critical when it comes to the collection of data.

I urge the Commission to resist the effort to collect and share personal family and student data. I also recommend that any such information that is collected be excluded from any recommended clearing house and that such a clearing house be subject to all the checks and balances that is provided by our Constitution. In addition to whether the government should have records in the first place, I propose that parents and students have a means to review and correct their records and determine who may see them.

Critical Issues for the Commission on Evidence-Based Policymaking

Founded in 1991, Social Policy Research Associates (SPR) is a nationally recognized research, evaluation, and technical assistance firm located in Oakland, California. Our work provides insight to government, non-profit and foundation clients on what works in workforce development, human services, education and effective philanthropy. After more than 25 years of working with dedicated people working on behalf of some of some of our nation's most vulnerable populations, we've learned that people are better able to make good decisions when they have good information. Program directors want to do their best work and create lasting impact on their clients. This requires high-quality data, rigorous analysis, and the ability to act on the lessons from both. The commission's work represents an excellent opportunity to create infrastructure and culture to advance two areas critical to that ability:

- Promoting evaluation requirements for publicly-funded programs that are both rigorous and realistic

- Improving the quality and accessibility of administrative data, including by supporting the development of integrated state database systems.

We appreciate this opportunity to inform the commission on the importance of the above issues.

#1 Promote evaluation requirements that are both rigorous and realistic

The evidence generated by third-party evaluations can provide critical insight on how best to allocate resources and develop policies in order to move our nation's workers and families to economic stability. To ensure that such evidence is available, evaluation must be both required by the funding entity and held to certain standards of rigor. For example, SPR has been privileged to evaluate five different programs funded by the US Department of Labor's Workforce Innovation Fund, a grant program which enabled states and local areas to pilot innovative approaches in workforce development. Grantees received larger amounts to scale and/or replicate evidence-based approaches and evaluate them using an experimental or quasi-experimental design, and smaller amounts to test new approaches using evaluation approaches that measure changes in participant outcomes, but do not assess whether the program caused these changes. This approach allows both the program and its evaluation to move the field forward, by centering the importance of conducting evaluation while accounting for the fact that the most rigorous evaluation designs are not always appropriate for the first attempt to learn about a particular service design.

Under the Workforce Innovation Fund, SPR has been able to conduct evaluations of promising approaches in workforce development—using a variety of methods appropriate to where each approach is situated in its development—to inform the rollout of service delivery under the new Workforce Innovation and Opportunity Act, which incorporates many approaches first tested under

the Workforce Innovation Fund. Simply put, encouraging innovation while requiring evaluation makes it easier to learn what works and for whom. This approach should be expanded to other agencies and to any new funding streams to come under the current administration.

#2: Improving the Quality and Accessibility of Administrative Data

One of the most essential parts of conducting high-quality evaluation to support policy development and refinement is being able to track evaluation participants in administrative data: for example, using Unemployment Insurance wage records to determine whether a job training program increased earnings or using arrest and conviction records to determine whether an offender reentry program reduced recidivism. In both cases, to determine whether an investment in a program was worthwhile, evaluators need access to high-quality, individual-level data from government agencies. SPR has collected employment, education and criminal justice data from state and local agencies across the country, and encountered wide variation both across and within states in how such data are standardized, stored, shared, and linked depending on the agency in question. Key issues encountered include:

- Inconsistent, but often lengthy and cumbersome, processes for accessing data. Each agency negotiates its own data sharing agreements, which can add up to significant time and cost for national studies that require data from multiple agencies in many states, particularly when there may be variations in exactly what the process requires and how long it takes.

- Differences in the collection and completeness of data across agencies. For example, data may be stored in different electronic formats or even in hard copy, and evaluators must therefore allocate time to merging, standardizing and even keying all of the data prior to analysis. Administrative data also do not always include or release the same variables, and this limits the extent to which analysis can identify what works for whom.

In addition to this experience accessing administrative data for evaluation, SPR has also been privileged to serve as the technical assistance provider for the Department of Labor's Workforce Data Quality Initiative (WDQI), which provided grants to states to develop longitudinal administrative databases in order to facilitate a more comprehensive understanding of workers' training, employment and earnings outcomes over the course of their careers. Longitudinal databases can also help state agencies understand system dynamics over time—how quickly, for example, training programs are developed and accessed relative to labor market shifts that require new training. Through our work with state agencies as a technical assistance provider, several key challenges have been made clear: the difficulty of tracking outcomes for individuals as they move across state lines, the need to navigate and adhere to multiple privacy regulations when linking data, and the need for improved data systems at the state level. WDQI has helped surface these issues and bring agencies together to consider how to address them, but further investment is needed to put these ideas into action and replicate successful approaches both across states and to other policy areas beyond workforce development and education.

Thank you for the opportunity to address the commission during this important time for evidence-based policymaking. Researchers, policymakers and program administrators have a growing common understanding of the need to do a better job of understanding what works and why, so we can invest public dollars wisely and do work that matters most.

Dr. Andrew Wiegand (*Ph.D., Social Psychology, University of California, Santa Cruz, M.P.P., University of California, Berkeley*) is the President and CEO of Social Policy Research Associates. In his nearly two decades of work at SPR, Dr. Wiegand has served as Project Director and/or Principal Investigator for more than 20 national evaluations, as well as multiple state and local evaluations A well-known expert on evaluations of workforce, education, and human services programs, particularly those focused on youth and justice-involved individuals, Dr. Wiegand has led or helped to lead national impact evaluations of the Pell Grant Experiments, the Reintegration of Ex-Offenders (RExO) Project, and YouthBuild, as well as multiple studies of programs funded under the Workforce Investment Act and its successor, the Workforce Innovation and Opportunity Act.

Other Public Input–Hearing Testimony

AMERICAN
EVALUATION
ASSOCIATION

DATE: August 24, 2016

TO: Katherine G. Abraham, Chair, Commission on Evidence-Based Policymaking
Ron Haskins, Co-Chair

SUBJECT: Testimony submission to the Commission on Evidence-Based Policymaking

THROUGH: Shelly Martinez, Executive Director for the Commission on Evidence-Based Policymaking

VIA EMAIL: rochelle.wilkie.martinez@census.gov

On behalf of the American Evaluation Association (AEA), we are writing in support of the Evidence-Based Policymaking Commission and to thank you for your efforts on such an important and challenging undertaking. AEA formally supported this legislation and worked with Congressional staff during its drafting to advance awareness and use of evaluation in government decision making. Both Congress and executive branch agencies have critical needs for credible assessments of the relevance, efficiency, and effectiveness of government programs, policies, and activities. AEA applauds the work of the Commission to help Congress embed evaluation into program design and to ensure that quality data are available for evaluation of federal programs.

AEA looks forward to addressing the specific questions and issues that arise during the Commission's deliberations. We are prepared to provide support and advice in any manner that best suits the needs of the Commission. This could include (1) in-person testimony during which AEA can engage in a dialogue with Commission Members, (2) suggestions about possible members for any evaluation-focused advisory committees, (3) interaction with various Commission subcommittees, and (4) additional, more detailed, documents.

At the outset of your work, and drawing on its collective extensive evaluation expertise and over 30 years of practical experience, AEA wishes to bring the following recommendations to your attention regarding a portion of the charges to the Commission:

Under section 4 (a), the Commission is charged with making "recommendations on how best to incorporate outcomes measurement, institutionalize randomized controlled trials, and rigorous impact analysis into program design."

We agree that program design should include an appropriate evaluation framework to guide data collection and use over the life of a program. Such early evaluation planning also enables the use of rigorous impact evaluation methods that require data collection prior to implementation, such as randomized control trials. However, the opportunity to capitalize on early successes or to make mid-course corrections is also critical, so it is essential also to conduct ongoing formative evaluation through the program's life cycle. For example, evaluation can address questions that arise during implementation of the program, such as the validity of assumptions that underlie program design, or challenges to implementation in the field. Early in the program's history, relatively simple information may be needed quickly (e.g., regarding obstacles to participation in the program). Evaluators should match the

AMERICAN
EVALUATION
ASSOCIATION

methodology to the stage of program development and to information needs, which may call for a range of methods over time, including targeted data collection that may not always include outcomes measurement. Thus, the optimal integration of outcomes measurement, randomized controlled trials, and rigorous impact analysis should include room for other methods as well.

Such a framework will also include several other components, including: (a) a sound procedure for establishing annual and multi-year evaluation agendas and timetables, (b) consultation with appropriate congressional committees, OMB, and other external program stakeholders on their information needs, (c) a dissemination plan, preferably with public access, (d) resources needed for evaluation, and (e) formal expectations regarding how the findings and conclusions of evaluations shall be considered in subsequent program design, program management, and decisions regarding program reform, expansion or termination.

Organizational structure and staffing are also important. Thus, we suggest it important to ensure independence of the evaluation function from program offices with regard to evaluation design, conduct, and reporting. Consultation is needed to ensure relevance, but independence is needed to ensure impartiality. Adequate staffing of evaluation units and support for professional development are also necessary if the Commission's work is to achieve the kind of benefits foreseen by Congress.

Under section 4 (b), the Commission is charged to 'consider whether a clearinghouse for program and survey data should be established and how to create such a clearinghouse.'

We encourage the Commission to engage in this important task while trying to avoid unintended negative side effects. While recognizing the value and importance of large-scale extant archives and datasets, they should not reduce the capacity to gather targeted data as needed to address program evaluation questions. Measures of a program's key processes and outcomes should be established while the program is being developed, and should be put into place by the time program implementation begins. The most relevant measures might not exist in an extant clearinghouse.

We also ask the Commission to consider whether the proposed clearinghouse could serve as a repository for evaluation reports, serving as an archive capacity for the collection, dissemination, and preservation of knowledge and lessons learned from evaluation studies. This would provide an enhanced base for guiding future program design and management, which often requires a critical mass of knowledge to properly comprehend and address the complexity of program processes and influences. It would also be a great benefit for future meta-analyses of evaluation findings.

The American Evaluation Association has been the professional organization devoted to the application and exploration of evaluation in all its forms since 1986. It now has 6,000 members across all 50 states, as well as 80 other countries. It has developed professional standards for the quality of studies and ethics for the multidisciplinary members of the field. AEA has created a community of learning and practice over the decades, in which its members in academia have worked to develop, refine and teach evaluation methods, while its members in practice have served the evaluation needs of agencies across the federal (as well as state and local) government. AEA developed the attached ***An Evaluation Roadmap for a More Effective Government*** (www.eval.org/d/do/472) to offer to improve evaluation and the use of study results in the federal government. This document defines "evaluation" and addresses management

requirements for ensuring evaluation quality and usefulness, including methods, human resources, budgets, independence, transparency, and professional ethics.

We look forward to a dialogue regarding Commission efforts and progress. If we can be of further assistance, or if you need more information about evaluation or our organization, please do not hesitate to call on us or to contact Dr. Cheryl Oros, our Senior Advisor for evaluation policy (EvaluationPolicy@eval.org; 202-367-1166).

Sincerely,

John Gargani, Ph.D.
President, American Evaluation Association

Kathryn Newcomer, Ph.D.
President-Elect, American Evaluation Association

Stewart Donaldson, Ph.D.
Past President, American Evaluation Association

Attachment: *An Evaluation Roadmap for a More Effective Government* (www.eval.org/d/do/472)

September 9, 2016

Dr. Katharine G. Abraham, Chair
Mr. Ron Haskins, Co-Chair
Commission on Evidence-Based Policymaking
U.S. Census Bureau
4600 Silver Hill Road
Suitland, MD 20746

Dear Chairwoman Abraham and Co-Chairman Haskins:

America Forward is writing to thank you both for your willingness to lead the important effort of the
newly established bipartisan Commission on Evidence-Based Policymaking. We were advocates of the
Evidence-Based Policymaking Commission Act when it was introduced by Speaker Ryan and Senator
Murray and supported efforts to ensure its passage given its alignment with our belief that in times of
greater demand for human and social services and tighter budgets, we must work together to direct
government resources to programs that work and that measurably improve people's lives. We would
like to offer our thoughts on the work before the Commission over the next 15 months and offer specific
insights and recommendations based on our Coalition's experiences for how to ensure the promise of
providing "the nation with guidance on ways to further expand our approaches to evidence-building in
government"[1] is realized.

America Forward is a nonpartisan effort to unite social innovators with policymakers and advance a
public policy agenda that fosters innovation, rewards results, catalyzes cross-sector partnerships, and
translates local impact into national change. At America Forward, we champion innovative, effective,
and efficient solutions that are helping to tackle our country's most pressing social problems. We do
this through a network of more than 70 social innovation organizations, the **America Forward Coalition**,
who are driving progress in areas such as education, workforce development, early learning, public
health, pay for success, and national service in more than 14,500 communities nationwide, touching the
lives of 8 million Americans each year. Our work is grounded in the real world, community-based
experiences of these organizations and those they serve. This grounding, we think, serves us extremely
well in not only identifying and championing policy solutions that will have real meaningful impact but
our ability to point to tangible examples of these solutions in action, and to real people who these
solutions have touched, sets us apart from other advocacy organizations.

Ensure Focus on Practice and On-the-Ground Implementation

The real promise for the Commission for us at America Forward is that the focus on bringing evidence
and greater attention to outcomes will not only be in service to the creation of better policies and
budgeting practices but that it will also serve to inform the improvement of existing federal programs,
service practice and delivery. Better policies and more effective allocation of resources only fixes a part
of the equation of having more evidence-based, government funded human and social services. The
way those services are delivered is equally important to ensuring that we are measurably improving the
lives of those who need to access these critical services at one point or another in their lives. Like our

---

[1] http://www2.census.gov/about/linkage/meetings/2016-07-22/abraham-haskins.pdf

approach to policy advocacy—it is not just about a good policy, it is about how that policy works on the ground and how it impacts those the policy is meant to help.

As with many Congressionally created commissions, there is the risk that this Commission will fail to include this practical lens to its work. State and local level government leaders and service providers, who are collecting data, using data, and ultimately serving the individuals who are behind the data points we need to build the evidence base around, are where the real promise of the Commission lies. It would be prudent for the Commission to include in its outreach and information gathering individuals outside of the traditional academic and research communities as well as to include a focus on how to make data available to inform real world service program design, delivery, and indicators of impact.

It is in fact the complementary combination of classic academics, applied researchers, and program facilitators and service providers that will ensure that the work of this Commission is as robust and significant as its promise holds. We think it is imperative that all of these perspectives, from all levels—federal, state and local—as well as across issue areas, are included and that a well-rounded group of experts is a part of the discussion that leads to this important Commission's conclusions and recommendations.

Include Provider/Practitioner Perspectives on Data

America Forward Coalition members share a commitment to using data to track progress and ensure accountability. That is why we are particularly supportive of the focus of the Commission on developing a strategy for increasing the availability and use of data in order to build evidence about government programs. The availability and use of administrative data is of particular interest because, as we know from our members' experiences, it is extremely important for engaging in meaningful evaluations and for driving down the cost of randomized controlled trials.

In addition to availability and use of data, our Coalition members have identified other challenges associated with data in the context of building the evidence of what works. These challenges include:

1. Even if data are collected and available, **antiquated data systems** particularly in the public sector make it difficult to efficiently access or engage in analyses of the data to measure outcomes and determine impact.
2. The challenges that millions of Americans face every day cut cross agencies and sectors. Allowing specific **datasets to "speak to" each other** is an important consideration for the Commission to explore. In order to adequately measure results and assess impact, data access and utilization must reflect the interconnected nature of the problems faced by Americans and the solutions being developed by organizations like those in the America Forward Coalition.
3. The mobility of Americans can make it difficult to track outcomes absent a **state or national database** that can accessed and used for building evidence and strengthening efforts by providers and governments to be more evidence-based. All of this must be done with an assurance of privacy and confidentiality.
4. Given the long time focus on compliance with rules rather than achievement of outcomes, both the **service delivery and government workforce are not accustomed to working with data** for purposes of evidence determination.

Encourage Federal Agencies to Adopt Relevant Data-Driven Innovations with Evidence of Effectiveness Identified through Innovation Fund and Tiered Evidence Programs

Tiered evidence models and innovation funds have been authorized across different agencies and included in various issue areas to develop and build the evidence base of what works in education and social services. One example, the Social Innovation Fund (SIF), makes grants to experienced intermediary organizations that are well positioned within communities to identify innovative, evidence-based programs with potential for expansion in the areas of economic opportunity, healthy futures, and youth development. Since 2010, the SIF has made awards totaling $243 million with more than $528 million in private and non-federal matching funds. In total, more than 400 nonprofit organizations are being funded by the SIF to conduct diverse interventions and evaluate results through highly rigorous models.

One challenge facing innovations funds like SIF and tiered evidence programs such as the Investing in Innovation program (i3) at the Department of Education is identifying a pathway to integrating and expanding approaches determined to have evidence of effectiveness under this funds in a manner that aligns with existing federal efforts to address national and local challenges. In fact, despite the SIF's widespread success and the bi-partisan support of i3, many federal agencies are unaware of the innovations supported by these funding streams that could help improve existing programs, yielding better outcomes for vulnerable communities. As the Commission builds out its priorities and scope of work, our Coalition suggests that you encourage federal agencies to adopt relevant data-driven programs/strategies with evidence of effectiveness currently supported by the Social Innovation Fund, the Investing in Innovation Fund and other similar programs whose evaluations, data, and experience of partner organizations are of particular value to federal agencies tasked with providing effective services in the areas of economic opportunity, healthy futures, and youth development.

America Forward stands ready to work with this important Commission to ensure that the concepts of evidence and outcomes are being used to develop policies and fund interventions. We believe this should become common practice at the federal, state and local level to address the current and future challenges we face as a nation.

Thank you for your leadership of the Commission on Evidence-Based Policymaking and for your effort to strengthen the government's evidence-building efforts.

Sincerely,

Nicole Truhe
Government Affairs Director, America Forward

Washington, DC 20004

To:	Commission on Evidence-Based Policymaking
From:	Laura and John Arnold Foundation
Date:	December 22, 2016
Re:	Docket ID USBC-2016-0003

Laura and John Arnold Foundation
Letter to the Commission on Evidence-Based Policymaking

Dear Commissioners,

As Vice Presidents of the Laura and John Arnold Foundation (LJAF) focused on improving evidence-based policymaking by federal, state, and local governments, we are submitting this letter in response to the Commission on Evidence-Based Policymaking's request for comments.

We believe the Commission's statutory charge from Congress presents a critical opportunity to reshape the way governments use data and evidence to improve citizens' well-being. By using modern technology and protocols that protect individual privacy, it is now possible to create a data infrastructure that enables government decision makers, as well as consumers and private sector organizations, to obtain reliable, actionable information that can drive their choices on how to use resources more effectively.

Governments in other countries such as Denmark, the Netherlands, the United Kingdom, and Estonia are embracing secure data-linkage techniques to help solve problems for their citizens. In the United States, where administrative data from social programs are scattered across programmatic silos in federal, state, and local governments, an optimal data infrastructure requires collaboration among multiple parties. We believe the government agencies that administer programs and thus "own" the associated administrative data should work with research data centers that have the existing infrastructure to link and analyze data while protecting individual privacy. Since the enactment of the Confidential Information Protection and Statistical Efficiency Act of 2002, federal statistical agencies and academic research data centers throughout the United States have demonstrated the ability to link and manage personally identifiable data for research purposes without breaches of privacy.

We recommend the Commission go beyond offering general recommendations for improving data infrastructure and the evaluation of government programs *as we know them today*. Instead, the Commission should seize the opportunity to call for a modernized data infrastructure that could lay the essential groundwork for transformational reforms in how governments plan, structure, manage, and evaluate programs to yield substantially higher returns on taxpayer investments.

Recommendations

In recent years, LJAF has supported collaborations between governments, researchers, and data scientists across the country in an effort to help to address numerous challenges at the federal, state and local levels. In the appendix, we highlight some of our most impactful projects involving partnerships between governments and universities to enhance evidence-based policymaking. Our projects serve as proof points that demonstrate ways that government programs can be improved through the use of data and evidence. We offer four overarching recommendations for how to strengthen government's evidence-building efforts:

1. **Develop and apply evidence-focused design principles to all government programs.** Congress and the administration should embed strategies *within* programs that will increase the share of resources that are allocated to evidence-based practices and to rigorous evaluation of promising approaches. Initial design principles can be drawn from existing evidence-based initiatives such as the Department of Education's Education Innovation Research program, pending legislation for Social Impact Partnerships, Performance Partnership Pilots for Disconnected Youth, and waiver demonstrations that require rigorous evaluations in welfare programs administered by the Administration on Children and Families and the Food and Nutrition Service. The principles should guide all new legislation, reauthorizations, regulatory reforms, and efforts to modernize agency administrative procedures.

2. **Set an expectation that state and local governments that administer federal programs should conduct ongoing data analysis and rigorous evaluation and require that they make their administrative data accessible to the federal government to facilitate research. Governments should use existing program funds for this purpose.** State and local governments are allocated hundreds of billions of dollars every year to administer federally funded programs and gather data on outcomes. Yet few have strong internal capacity for data analytics or evaluation, and many lack incentives to share their data for research and program improvement, which often requires a cumbersome process of negotiating agreements to link data across jurisdictional boundaries. The federal government should help state and local governments better measure their impact and administer their programs by creating the capacity to link data across jurisdictional silos and providing useful information to state and local governments. The federal government should also provide additional funding to facilitate data transfers. Such an approach would make it easier for academic institutions and innovative government structures to analyze the impact of new programs and policies on local populations.

3. **Create a network of government and research institutions that facilitates secure data linkages while protecting individual privacy.** To protect the privacy of individuals, there must be a secure and trusted network of access

points to potentially identifiable data. This infrastructure should be built upon the existing university-based Federal Statistical Research Data Centers and include modernized processes to speed approvals of projects that meet federally determined standards for accessing data. Together, these organizations can provide a highly secure data infrastructure to support important information needs of federal, state, and local governments, private sector organizations, and the public. Such a network can produce reliable published research and aggregated statistics to help governments and other decision makers understand the root causes of problems, direct services and benefits to where the needs are greatest, measure performance on important outcomes, and evaluate the impact of alternative strategies.

4. **Strengthen federal agency evaluation and management capacity.** Congress and the administration should collaborate to refine and expand the successful evaluation practices the Obama administration implemented in agencies such as the Department of Labor. In addition, the Paperwork Reduction Act (PRA) and the Government Performance and Results Modernization Act (GPRMA) should be evaluated to determine how to better help federal, state, and local government agencies gather and use information to improve outcomes for program beneficiaries. Future efforts to assess and rate particular programs—such as a new Program Assessment Rating Tool (PART)—should be guided by specific policy goals that cut across program labels. Review processes should be designed to identify strategies *within and across programs* that are most effective at achieving overarching policy goals and developing ways to scale those strategies.

The above recommendations address four core challenges that prevent government programs from realizing their full potential to improve lives:

1. **Fragmented federal program structures lack the flexibility and incentives to focus state and local resources on improving outcomes.** Today, vulnerable populations are served by multiple programs run by different federal departments and state and local agencies, each with its own bureaucratic apparatus focused on a particular set of activities. Local governments and providers that deliver services lack the flexibility to combine funds and design coordinated interventions that will achieve the best outcomes per dollar spent. Only a handful of federal programs launched during the Obama administration—such as tiered evidence grants[i] and Pay for Success initiatives—create strong financial incentives for grantees to use existing evidence of what works and participate in rigorous evaluations to build new knowledge.

2. **The federal government has poorly communicated the role of data analysis and evaluation in program implementation.** There is a widespread perception across government programs and among grantees that data analysis and evaluation are not core elements of effective program

administration, and little or no program funding is allocated for these purposes. Government has not signaled to grantees that they should integrate data analysis and evaluation into their operations in order to test, learn about, and improve the impact of strategies, nor that they should use a portion of their program funds for this purpose if other funding is not available. State and local governments that seek to test, learn, and improve their public impact are stymied when the people they serve move across jurisdictional lines or when the agencies that serve them in one location lack the necessary relationships to share information. Instead of using reliable data that government already collects to address this problem, each federal grant program sets its own reporting requirements to ensure accountability. However, this reporting, which is often onerous and time-intensive for grantees, rarely generates information that is useful for helping grantees or government program managers improve their programs. Rather, this approach to accountability undermines grantees' confidence in the ability of the federal government to help with data analysis and evaluation.

3. **Lack of secure access to high-quality and high-coverage data makes it difficult or impossible to measure progress and evaluate impact.** Authoritative sources at various levels, including both governmental and private-sector sources, hold certain data that would be useful to government managers and grantees. However, this data is highly dispersed across sectors and levels of government. Examples include receipt of public benefits, earnings, healthcare usage, criminal justice involvement, and educational attainment—many of the key outcomes that public policies aim to improve. As people move between states and systems, it is extremely difficult to negotiate among all the data "owners" who must cooperate in order to build a complete picture of the individuals served by various systems. In the instances where the federal government currently holds this kind of unified data on outcomes, there is little capacity to provide streamlined access to governments and researchers. Meanwhile, state and local data owners apply inconsistent protections to safeguard the privacy of individuals in their systems.

4. **Federal agencies lack the internal processes for assessing the impact of their programs and directing funds to use and build evidence.** For the most part, agencies lack the internal structures and routines to unite the management of programs with the evaluation of strategies implemented within programs. Over time, the share of resources allocated to strategies proven to be effective through rigorous research—or to efforts to consciously build evidence on promising approaches—has remained troublingly low. Public outcomes have suffered. Impediments to learning and improvement are sometimes embedded in law. For example, the PRA and GPRMA have created burdensome compliance processes that divert resources from valuable activities. Past efforts, such as the PART, have been overly focused on the performance of individual programs rather than the improvement of public outcomes through strategies that cut across programs.

The attached document, "Detailed Recommendations from the Laura and John Arnold Foundation for Improving Government's Capacity to Use and Build Evidence," provides specific recommendations around each of these four challenges that are informed by our collective experience and the knowledge we have gained through our network of grantees. We would be happy to provide any additional information upon request.

Sincerely,

Kathy Stack, Vice President of Evidence-Based Innovation

Jon Baron, Vice President of Evidence-Based Policy

Josh McGee, Vice President of Public Accountability

Stuart Buck, Vice President of Research Integrity

Appendix

Detailed Recommendations from the Laura and John Arnold Foundation for Improving Government's Capacity to Build and Use Evidence

This document builds upon the recommendations in the Laura and John Arnold Foundation's (LJAF's) December 22, 2016 letter to the Commission on Evidence-Based Policymaking. Under each of our recommendations, we provide examples of projects supported by our grantees or activities we carry out directly that serve as proof points that government programs can be transformed to generate higher value for taxpayers through use of data and evidence. These examples, which we consider building blocks for a future evidence infrastructure, have informed our detailed recommendations.

1. **Develop and apply evidence-focused design principles to all government programs.**

During the Obama administration, a number of significant outcomes-focused, evidence-based program initiatives were launched that created strong financial incentives for grantees and providers to use existing evidence of what works and to participate in rigorous evaluations to build new knowledge. These included tiered evidence grants (*e.g.,* the Department of Education's Investing in Innovation Fund and the Department of Health and Human Services' Home Visiting program), Pay for Success pilots, Performance Partnership Pilots for Disconnected Youth, and waiver demonstrations in welfare programs.

LJAF is committed to helping policymakers and researchers refine these models and expand their use in order to improve government effectiveness. As examples of this work, members of the foundation are having discussions with stakeholders about how to enhance the impact and cost-effectiveness of evidence-based program initiatives by using the following approaches:

- *Adopting a standard approach to tiered evidence grantmaking in social programs modeled on the successful Small Business Innovation Research (SBIR) program.* The attachment to this appendix is a short concept paper that outlines our proposed approach and provides a template that could be used to apply the approach across a range of social spending programs. This program model was developed for federal competitive grants with a matching requirement to incentivize state and local governments to use funds they control (including federal formula funds) for evidence-based approaches. A similar model could be used by state governments to allocate funds to localities and other grantees.

- *Increasing the use of low-cost randomized controlled trials (RCTs).* Low-cost RCTs are a powerful new tool for building scientific evidence about "what

works" to address major social problems. Well-conducted RCTs are widely regarded as the most credible method of evaluating whether an intervention model is effective, but they are often assumed to be too expensive and burdensome for practical use in most areas. However, researchers have recently shown that in many instances, high-quality RCTs can be conducted at a low cost and minimal burden, addressing a key obstacle to their widespread use. The low cost is achieved by:

- Embedding random assignment in initiatives that are already being implemented as part of usual program operations. RCTs can be embedded in many new or ongoing programs, for example, by using a lottery process (*i.e.,* random assignment) to determine who among those eligible will be offered a particular service model (since available funds are often insufficient to serve everyone who qualifies).
- Measuring key study outcomes with administrative data that are already collected for other purposes (*e.g.,* student test scores on state exams, criminal arrest records, and health care expenditures), rather than engaging in original—and often expensive—data collection through interviews or testing.

Such studies make it possible now as never before for policy officials to use scientific evidence about what works to increase government effectiveness. LJAF is funding numerous low-cost RCTs (costing between $50,000 and $300,000) that have large samples, strong designs, long-term follow-up, and outcome measures of self-evident policy importance. For examples, see: http://www.arnoldfoundation.org/wp-content/uploads/Request-for-Proposals-Low-Cost-RCT-Competition-FINAL-9.30.16.pdf.
The U.S. Department of Education and National Institutes of Health have also recently launched low-cost RCT funding initiatives.

We believe the Commission's recommendations should include program design principles for social programs that aim to increase the share of resources that are allocated to evidence-based practices over time. If the incoming administration adopts a diagnostic tool such as the Program Assessment Rating Tool (PART) to assess program effectiveness, the tool should also assess a program's capacity to use and build evidence about what works. The following program design principles should guide all new legislation, reauthorizations, regulatory reforms, and agency administrative practices:

- *Focus on outcomes.* Define the primary and secondary outcomes that programs will be accountable for achieving. Avoid prescriptive requirements for how those outcomes should be achieved.
- *Use and build rigorous evidence.* Ensure that programs have requirements and incentives for decision makers at every level of a program to:

- o Use existing evidence about what is likely to work best to improve outcomes for program participants;
- o Build new evidence using rigorous and cost-effective research methods about what works best for different populations in different contexts;
- o Adopt consistently high standards for what constitutes rigorous evaluation; and
- o Enable measurement and evaluation of long-term outcomes after participants are no longer receiving services, with a focus on outcomes related to education, employment, criminal justice involvement, and health.

- *Encourage innovation.* Reward entrepreneurial innovation, provided there is rigorous testing and learning about which strategies are most effective.
- *Leverage state and local funds.* Require or incentivize state and local governments to allocate an increasing share of the funding they control (including federal formula funds) to scale-up evidence-based practices.
- *Consolidate programs while targeting services.* Reduce the number of programs that are serving similar populations by combining funding streams so that program administrators and practitioners have greater flexibility to deliver the best mix of services using the most effective strategies. Any restructuring should include strong safeguards to ensure that services and benefits are targeted to vulnerable populations most in need.
- *Improve use of high-quality data.* Maximize production of, access to, and use of high-quality data. Limit reporting to those data elements that are most important for assessing progress, measuring outcomes, and evaluating impact. Wherever possible, enable state and local governments and service providers to measure progress and evaluate results by linking participant data to reliable administrative and survey data held by third parties in secure data facilities.

2. Set an expectation that state and local governments that administer federal programs should conduct ongoing data analysis and rigorous evaluation and require that they make their administrative data accessible to the federal government to facilitate research. Governments should use existing program funds for this purpose.

State and local governments administer hundreds of billions of dollars of social program funding every year, most of which is provided by the federal government. Through partnerships with strong researchers, state and local governments can use data, evidence, and innovative experimentation to learn what works and improve program delivery. LJAF-funded projects that demonstrate the types of activities that federal dollars could support include the following:

- Established in 2015, the Rhode Island Innovative Policy Lab (RIIPL) at Brown University built a linked longitudinal database from Rhode Island's government agencies and private vendors. Researchers are using this

database to inform real-time policy decisions, educate policymakers in their pursuit of improving economic and social outcomes, and increase the supply of experimentation and rigorous evaluation in Rhode Island. RIIPL is currently working with seven agencies on 17 projects that span areas such as juvenile recidivism; foster care; supplemental nutritional assistance; Medicaid; maternal, infant, and early childhood home visitation; labor training; debt-related incarceration; tax incentives; the Earned Income Tax Credit; and policing.

- The Government Performance Lab at the Harvard Kennedy School of Government (GPL) has been working in jurisdictions across the country to facilitate Pay for Success projects, results-driven contracting, and performance improvement activities. A complete list of projects is available here: http://govlab.hks.harvard.edu/our-projects.
- The Abdul Latif Jameel Poverty Action Lab at the Massachusetts Institute of Technology (J-PAL), through its State and Local Innovation Initiative, is supporting randomized policy evaluations at the state level in Pennsylvania and South Carolina, at the city level in Philadelphia and Rochester, N.Y., and at the territory level in Puerto Rico. These evaluations aim to address significant social problems facing state and local leaders. For example, these evaluations examine approaches to increase employment and economic mobility and to find more effective treatments for substance use disorders.

The projects described above have demonstrated cost-effective ways for state and local governments to partner with research institutions to solve important problems that could be carried out on a larger scale without legislative change. We believe the Commission should recommend that federal agencies take administrative actions that:

- *Set clear expectations for state and local grantees regarding data analysis and evaluation.* The Office of Management and Budget (OMB) and federal agencies should clarify that state and local grantees (1) are expected to analyze data and evaluate the impact of their program strategies using rigorous methods; (2) are encouraged to partner with strong researchers in academia to carry out these activities; and (3) are allowed to use programmatic funds for these purposes.
- *Ensure accessibility of grantee data.* The federal government should require that states and localities make key data needed to measure progress and outcomes accessible to the federal government for research purposes. The federal government should collaborate with states and localities to develop standard language for procurements that require contractors to make data accessible to state and local governments for program analysis and to the federal government for research purposes.

When legislative barriers prevent federal agencies from implementing these policies through administrative action, Congress should remove the barriers through legislation.

The LJAF-funded projects described above rely on high-quality administrative data to conduct rigorous low-cost evaluations. However, these projects are limited by their lack of access to national datasets, which would allow them to measure outcomes for participants who move across state lines.

To facilitate the development of similar high-value projects, and to improve projects like these, the federal government should require that state and local data generated for the administration of federally funded programs be accessible for research purposes. Once the data from local and state programs is linked with federally held data, useful information can be provided to state and local governments in ways that will greatly enhance what these governments can learn about their programs.

To be scalable and sustainable, partnerships like those described above, or other efforts to improve the research capacity of governments, should not rely entirely on philanthropic funding. Instead, government should recognize the value of such efforts and provide financial support. The federal government could spur this shift by clarifying that (1) state and local governments that administer federal programs are *expected* to analyze data and conduct evaluations to improve program impact and (2) programmatic funds may be used to finance data infrastructure and evaluation activities. To avoid placing a burden on states and localities without providing commensurate resources, the federal government should provide additional funding for data sharing activities.

3. Create a network of government and research institutions that facilitate secure linkage of data while protecting individual privacy. LJAF supports a number of projects with research institutions that are pioneering innovative strategies for linking personally identifiable information while protecting privacy. Most of these projects benefit state and local governments that are seeking to link data across programs or levels of government in order to answer important policy questions.

- Actionable Intelligence for Social Policy (AISP) is an initiative that focuses on the development, use, and innovation of integrated data systems (IDS) for policy analysis and program evaluation. The goal is to make it easier for state and local governments to establish and evaluate effective programs by linking privacy-protected data across agencies and standardizing IDS practices. In 2009, AISP formed a network of county agencies, city agencies, state agencies, and universities around the country to address the lack of national standards for IDS. The AISP network now has 13 sites that engage in multi-site research projects and share best practices for maintaining and developing an IDS.

- In the summer of 2016, LJAF provided support to Chapin Hall at the University of Chicago to release an RFP titled "Using Linked Data to Advance Evidence-Based Policymaking," which solicited research projects that could benefit from securely linking state or local-level data with federal data held at the U.S. Census Bureau. The data linking services offered by Chapin Hall could support a range of analyses including impact evaluations, long-term follow-up studies of prior RCTs, outcome measurement studies, needs assessments and descriptive studies, and multi-generation studies. The projects identified through the RFP include a long-term follow up of welfare demonstration projects in the 1990s, an evaluation of a higher education student aid program, and an analysis of the effect of birth weight and perinatal services on a population in California. None of these projects could have been accomplished using un-linked federal or state data alone.
- LJAF provided a planning grant to the Virginia Tech Social and Decision Analytics Lab (SDAL) to develop a strategy to increase the use of data analytics to answer pressing policy problems in small- and medium-sized jurisdictions around the country. The grant resulted in a plan to use the national land-grant university system, which is comprised of research universities with a public service-based mission, and the associated Cooperative Extension Service, which has a presence in most counties across the country, to bring together local policymakers and researchers supported by the analytics capacity at the university. The collaboration will allow different state university systems to focus on different issues. For example, land grant universities in Virginia may develop analytic capacity around youth development and opioid use and their counterparts in Iowa may focus on early childhood development. All of those topics require linking data across agencies and levels of government to measure relevant outcomes.

In addition to these grant projects, LJAF staff are investigating new privacy-preserving technologies employed in the United States and other countries. A number of modern cryptographic and statistical techniques are making it possible for researchers to study and learn from data while preserving privacy for individual records. Indeed, a relatively recent development known as secure multi-party computation allows two sources of data to be merged and analyzed while remaining completely encrypted the entire time so that even the researchers themselves never see an individual's data.

In 2015, researchers in Estonia engaged in a large demonstration project in which they matched 500,000 education records with 10 million tax records to study whether working during college increased the risk that students would fail to graduate on time. Thanks to secure multi-party computation, both the tax and education datasets remained cryptographically secure throughout the analysis, thus allowing the research to take place even though sharing tax data was otherwise illegal under Estonian law. In the United States, secure multi-party computation has been

largely confined to defense and intelligence applications funded by DARPA, but could prove transformational if extended to other government programs' data.

We believe the Commission recommendations should include:

- *Create an intergovernmental network of data hubs.* The U.S. Census Bureau should become a central hub in a federated network of state and local governments and other research entities that hold high-value data. The U.S. Census Bureau should lead efforts to develop common standards and protocols for managing and linking data in ways that protect privacy and produce rigorous statistical and evaluation products.

- *Harness new privacy-preserving technologies.* Standards and protocols for data-linkage should be updated periodically to take advantage of evolving technology such as secure multi-party computing, which safeguards the privacy and security of data during analysis.

- *Finance data-linkage and analysis.* The federal government should create permanent, predictable funding for data-linkage and analysis activities carried out by federal statistical agencies and research data centers. Legislation and administrative procedures should clarify that a portion of these costs can be paid from appropriations for the agency programs that are benefiting from the data analysis.

4. Strengthen federal agency evaluation and management capacity. A number of federal agencies have made significant advances in evaluation capacity in recent years, setting examples that are highlighted by Results for America's [What Works Index], the [Evidence-Based Policymaking Collaborative], and Andy Feldman's [GovInnovator] podcast. These successful efforts pave the way for the next administration to refine these approaches and expand them at other agencies. In addition, there are other opportunities to tackle issues that the Obama administration has not adequately addressed. We believe the Commission recommendations should include:

- *Encourage coordinated agency learning agendas.* Agencies should implement learning agendas in coordination with other actors pursuing knowledge on the same subject. For example, learning agendas and evaluation strategies can be enhanced through collaboration with philanthropies and academic researchers. Coordinating investments on shared priorities will ensure that separate studies build toward common, policy-relevant aims. Maximizing access to and use of administrative data to produce high quality studies at low cost is a key component of widespread learning.

- *Create Chief Evaluation Officers across federal agencies.* Federal agencies should establish or designate Chief Evaluation Officers to lead the

development of learning agendas reflecting important research questions and to help agencies improve their effectiveness. Evaluation activities can be financed through line-item appropriations or through set-asides, such as those at the Department of Labor. Agencies should adopt and continually update rigorous standards for their research and evaluation activities, taking into account the findings of the National Academy of Sciences Workshop on "Principles and Practices for Federal Program Evaluation."

- *Promote purposeful testing of ways to increase savings and cost-effectiveness.* Federal agencies, as well as state and local partners, can improve their return on investment by evaluating strategies designed to generate savings and cut unnecessary costs. This process should include evaluations that identify what activities can be stopped or streamlined without diminishing program impact.

- *Create interagency working groups on cross-cutting evaluation issues.* Federal agencies that operate similar programs, such as regulatory enforcement and federal credit programs, should collaborate to develop evaluation strategies and tools that can benefit multiple agencies. These working groups should collaborate with outside researchers and philanthropy to leverage non-governmental expertise and funding to conduct evaluations.

- *Strengthen human capital for evaluation activities.* Agencies should strengthen their internal evaluation expertise through training of federal executives and staff. For example, the United Kingdom has developed competency standards related to evidence and evaluation that senior officials are expected to meet, and outside organizations such as Nesta offer training based on those standards. Federal agencies should create more opportunities for highly qualified researchers to work inside government to help agencies design and conduct evaluations, and clean and produce data sets that can be reused to answer multiple questions. To accomplish this, the administration should consider establishing an Evidence-Based Policy Fellows program to recruit top researchers to work at agencies for one or two years on high-priority research projects.

- *Reevaluate the Government Performance and Results Modernization Act (GPRMA).* In its current form, Government Performance and Results Modernization Act (GPRMA) creates a significant reporting burden for federal agencies without generating reliable and meaningful information to evaluate and improve programs. To meet federal accountability requirements for specific programs, state and local governments and non-profit grantees devote substantial resources to reporting data of dubious quality on inputs, outputs, and processes without receiving useful information in return. GPRMA should be reevaluated to minimize unnecessary reporting by agencies and grantees and to maximize the use of high-quality administrative data, leveraging new capacities to link data across programs. GPRMA should make state and local

governments central partners in helping to develop streamlined accountability systems focused on outcomes, which can help all levels of government produce useful data for performance measurement and rigorous program evaluation.

- *Integrate performance management and evaluation activities to generate reliable, actionable information.* In too many federal agencies, including OMB, performance management and evaluation activities are poorly coordinated. This creates confusion for senior agency officials and program managers who need useful information about what is working and what should be improved or stopped. OMB should improve its internal coordination of these functions and call upon agencies to focus performance management activities on improving data quality and access; using rigorous evaluation to learn what strategies are most effective within and across programs; and fine-tuning performance metrics to ensure they are correlated with programmatic impact. In recent years, the Department of Labor has been an exemplar of this approach. The President's management agenda, which might include an updated Program Assessment Rating Tool, could set standards that encourage better coordination of these functions.

- *Implement data-use agreements that allow long-term follow-up studies.* Currently, most data-use agreements for federal evaluations do not provide an option to re-use the data for long-term follow-up studies after the initial evaluation ends. This makes it very difficult to learn about long-term impacts of government policies. Federal agencies should update their standard data-use agreements to facilitate long-term follow-up studies. Federal agencies should further standardize any individual consent forms such that study subjects are routinely asked to consent to the preservation and sharing of data (*e.g.,* test scores) for future research purposes, rather than be limited only to one particular purpose or particular set of researchers.

- *Update the Paperwork Reduction Act (PRA).* OMB's clearance requirements under the Paperwork Reduction Act (PRA) create long delays and bottlenecks for agencies seeking approval of evaluations and have stymied efforts by agencies to increase the number of high-quality studies of important research questions. Congress and OMB should work to identify ways to streamline the PRA approval process for evaluations when agencies have other means to ensure evaluation studies use rigorous designs, address important questions, and minimize burden on the public by using administrative and survey data when feasible.

- *Research clearinghouses and other resources on evidence-based practices.* Congress and the administration should expand federal research clearinghouses and their capacity to deliver information in user-friendly ways that help state and local decision makers learn which strategies are most likely

to be effective for different communities. To improve transparency and reproducibility of research and evaluation findings, clearinghouses should adopt standards requiring researchers to preregister studies and make the underlying data available, in de-identified form, to other researchers.

---

[i] *Tiered Evidence Grants: Opportunities Exist to Share Lessons from Early Implementation and Inform Future Federal Efforts*, Government Accountability Office, GAO-16-818, September 2016.

Proposed Social Spending Innovation Research (SSIR) Initiative:
Harnessing American Entrepreneurial Talent to Solve Major U.S. Social Problems

The SSIR proposal seeks to replicate, in social spending, the great success of the Small Business Innovation Research (SBIR) program in technology development.

▪ **The SBIR program funds technology development by entrepreneurial small companies.** Under SBIR, created by Congress in 1982, 11 federal agencies allocate a small percentage of their annual research and development (R&D) budgets, for funding awards to small companies to develop and test innovative new technologies. The goal is to reach beyond the usual federal R&D grantees (*e.g.*, universities, large defense contractors) to fund a new set of entrepreneurs. The program has spawned breakthrough technologies in diverse areas such as computer chip production, commercial satellite communications, and medical imaging; and has received consistently favorable reviews in assessments by the National Academy of Sciences[1] and Government Accountability Office.[2] Congress reauthorized and expanded SBIR with overwhelming bipartisan support in 1992, 2000, and 2011. It is now funded at over $2 billion per year.

▪ **The proposed initiative, SSIR, would apply the successful SBIR approach in a different (non-technology) field—social spending—as discussed below.** A version of SSIR, focused on K-12 education, was recently enacted into law as part of the Every Student Succeeds Act of 2015—see attachment, sponsored by Senators Orrin Hatch (R-UT), and Michael Bennet (D-CO). The concept is also a key recommendation of House Speaker Paul Ryan's recent blueprint for addressing poverty, opportunity, and economic mobility.[3]

U.S. social spending critically needs an SBIR-like infusion of entrepreneurial new ideas and rigorous testing, because:

▪ **Many activities/strategies ("interventions") funded by government social programs are found to produce weak or no positive effects when rigorously evaluated.** When evaluated in rigorous randomized controlled trials, social interventions in K-12 education, employment and training, crime prevention, and other areas are too often found ineffective or marginally effective. Interventions that produce sizable effects on important life outcomes do exist, as discussed below, but tend to be the exception. This pattern occurs not just in social spending, but in other fields where rigorous evaluations are conducted, such as medicine and business.[4]

▪ **Meanwhile, the United States has failed to make significant progress in key areas such as:**

  – **Poverty:** The U.S. poverty rate now stands at 13.5%, and has shown little overall change (whether by official or alternative National Academy measures) since the late 1970s.[5]

  – **K-12 education:** Reading and math achievement of 17-year-olds—the end product of our K-12 education system—is virtually unchanged over the past 40 years, according to official measures,[6] despite a 90% increase in public spending per student (adjusted for inflation).[7]

  – **Well-being of low to moderate income Americans:** The average yearly income of the bottom 40% of U.S. households, now at $22,500, has changed little since the 1970s.[8]

▪ **Yet, entrepreneurs in the research, nonprofit, and for-profit sectors have developed a few interventions found highly effective in rigorous testing, illustrating what is possible.** Examples, evaluated in well-conducted randomized controlled trials, include:

- **Nurse-Family Partnership** – a nurse visitation program for low-income, first-time mothers during pregnancy and children's infancy (reduced child abuse/neglect and injuries by 20-50% over 2-15 years, compared to the control group).

- **Per Scholas Job Training** – a program for low-income, low-skilled workers that provides training in information technology (2½ years after program entry, increased workers' earnings by 31%, or $5,200 per year, compared to the control group).

- **New York City's Small Schools of Choice** – small public high schools created citywide in mostly high-poverty communities to replace large, low-performing high schools (4 years later, produced a 6-10 percentage point increase in the four-year high school graduation rate, versus the control group).

- **Such examples are rare because federal social spending has no systematic mechanism—analogous to SBIR—to fund and test innovative field-initiated ideas.** Federal agency evaluation funds generally focus on programs selected for testing by Congress or the agency, rather than initiated by entrepreneurs in the field. Agency research funding—such as that of the Institute of Education Sciences and National Institutes of Health—supports field-initiated ideas but is primarily focused on academic researchers and rarely funds entrepreneurial practitioners in nonprofit, for-profit, and state/local government organizations.

SSIR would use a streamlined, three-phase process—modeled on SBIR—to fund the development and rigorous testing of innovative social interventions. Specifically:

- **SSIR programs would be established at federal agencies using *existing* federal funds**. For example, Congress could direct federal agencies to restructure their existing discretionary social programs to incorporate the SSIR grantmaking process outlined below. Alternatively, as in SBIR, Congress could direct each agency to allocate a small percentage of its discretionary social spending (*e.g.*, 0.5%) to fund a new SSIR program at that agency.

- **Each agency SSIR program would focus on a broad area (*e.g.*, job training, crime prevention, health care delivery), and award grants through a competitive process.** Applicants could include nonprofit, for-profit, research, or state/local government organizations, with a priority for organizations that obtain a partial match of funds from other sources to help ensure the project's sustainability. Grants would include:

  - **Early-phase grants (*e.g.*, $50,000-$300,000) to fund the development and feasibility testing of an intervention which has promising prior research**, for the purpose of determining whether the intervention can be successfully implemented in real-world settings (*e.g.*, public schools, unemployment insurance offices, community health clinics);

  - **Mid-phase grants (*e.g.*, $0.5-3.0 million) to fund implementation and a rigorous evaluation of an intervention that has been successfully implemented under an early-phase grant** (or other effort meeting similar criteria), for the purpose of measuring the intervention's impact on important outcomes, such as employment and earnings, high school graduation, criminal arrests, or health; and

  - **Expansion grants (*e.g.*, $3-7 million) to fund implementation and a rigorous replication evaluation of an intervention found to produce sizable, important impacts under a mid-phase grant** (or other effort meeting similar criteria), for the purposes of delivering the intervention on a larger scale and determining whether its sizable impacts can be successfully reproduced and sustained over time.

Conclusion: Modeled on the successful SBIR program, the proposed initiative—SSIR—would infuse U.S. social spending with a critically-needed supply of entrepreneurial new ideas, shown in rigorous testing to produce important improvements in people's lives.

APPENDIX

SEC. 4611. GRANTS FOR EDUCATION INNOVATION AND RESEARCH

(a) PROGRAM AUTHORIZED—

(1) IN GENERAL: From funds reserved under section 4601(b)(2)(A),[1] the Secretary shall make grants to eligible entities to enable the eligible entities to—

(A) create, develop, implement, replicate, or take to scale entrepreneurial, evidence-based, field-initiated innovations to improve student achievement and attainment for high-need students; and

(B) rigorously evaluate such innovations, in accordance with subsection (di).

(2) DESCRIPTION OF GRANTS: The grants described in paragraph (1) shall include—

(A) early-phase grants to fund the development, implementation, and feasibility testing of a program, which prior research suggests has promise, for the purpose of determining whether the program can successfully improve student achievement or attainment for high-need students;

(B) mid-phase grants to fund implementation and a rigorous evaluation of a program that has been successfully implemented under an early-phase grant described in subparagraph (A) or other effort meeting similar criteria, for the purpose of measuring the program's impact and cost effectiveness, if possible using existing administrative data; and

(C) expansion grants to fund implementation and a rigorous replication evaluation of a program that has been found to produce sizable, important impacts under a mid-phase grant described in subparagraph (B) or other effort meeting similar criteria, for the purposes of—

(i) determining whether such impacts can be successfully reproduced and sustained over time; and

(ii) identifying the conditions in which the program is most effective.

(b) ELIGIBLE ENTITY—In this subpart, the term "eligible entity" means any of the following:

(1) a local educational agency;
(2) a State educational agency;
(3) the Bureau of Indian Education;
(4) a consortium of State educational agencies or local educational agencies;
(5) a nonprofit organization;
(6) a State educational agency, a local educational agency, a consortium described in paragraph (4), or the Bureau of Indian Education, in partnership with—
(A) a nonprofit organization;
(B) a business;
(C) an educational service agency; or
(D) an institution of higher education.

(c) RURAL AREAS—

(1) IN GENERAL: In awarding grants under subsection (a), the Secretary shall ensure that not less than 25 percent of the funds made available for any fiscal year are awarded for programs that meet both of the following requirements:

(A) The grantee is—

(i) a local educational agency with an urban-centric district locale code of 32, 33, 41, 42, or 43, as determined by the Secretary;

---

[1] This is $70.5 million in FY 2017-18 and $90.6 million in FY 2019-20.

(ii) a consortium of such local educational agencies;

(iii) an educational service agency or a nonprofit organization in partnership with such a local educational agency; or

(iv) a grantee described in clause (i) or (ii) in partnership with a State educational agency.

(B) A majority of the schools to be served by the program are designated with a locale code of 32, 33, 41, 42, or 43, or a combination of such codes, as determined by the Secretary.

(2) EXCEPTION: Notwithstanding paragraph (1), the Secretary shall reduce the amount of funds made available under such paragraph if the Secretary does not receive a sufficient number of applications of sufficient quality.

(d) MATCHING FUNDS—In order to receive a grant under subsection (a), an eligible entity shall demonstrate that the eligible entity will provide matching funds, in cash or through in-kind contributions, from Federal, State, local, or private sources in an amount equal to 10 percent of the funds provided under such grant, except that the Secretary may waive the matching funds requirement, on a case-by-case basis, upon a showing of exceptional circumstances, such as:

(1) the difficulty of raising matching funds for a program to serve a rural area;

(2) the difficulty of raising matching funds in areas with a concentration of local educational agencies or schools with a high percentage of students aged 5 through 17—

(A) who are in poverty, as counted in the most recent census data approved by the Secretary;

(B) who are eligible for a free or reduced price lunch under the Richard B. Russell National School Lunch Act (42 U.S.C. 1751 et seq.);

(C) whose families receive assistance under the State program funded under part A of title IV of the Social Security Act (42 U.S.C. 601 et seq.); or

(D) who are eligible to receive medical assistance under the Medicaid program; and

(3) the difficulty of raising funds on tribal land.

(di)   EVALUATION—Each recipient of a grant under this section shall conduct an independent evaluation of the effectiveness of the program carried out under such grant.

(dii)   TECHNICAL ASSISTANCE—The Secretary may reserve not more than 5 percent of the funds appropriated under section 4601(b)(2)(A) for each fiscal year to:

(1) provide technical assistance for eligibility entities, which may include pre-application workshops, web-based seminars, and evaluation support; and

(2) to disseminate best practices.

U.S. Department of Health, Education & Welfare, National Institute of Education. Washington, DC: National Center for Education Statistics, 1976.

[8] U.S. Census Bureau, Current Population Reports, 2016, op. cit., no. 5. This refers to inflation-adjusted income. It includes income from the economy (such as earnings) but not government transfers (such as Food Stamps). However, the evidence suggests that the overall story of income stagnation for the bottom 40% of households changes little even when one adjusts income for government transfers and other items that affect household living standards. Specifically, the Census Bureau's alternative, National Academy of Sciences-based poverty measures make adjustments for government transfers, as well as factors such as state and local taxes, work expenses such as child care, out-of-pocket medical expenses, and geographic differences in housing costs. These adjustments change the poverty rate in any given year, as well as the composition of those in poverty, but do not change the overall trend in the poverty rate over time – i.e., little overall progress since the late 1970s. (The relevant citations are in endnote 5.) Although the National Academy-based poverty measures only apply to a subset of the bottom 40% of U.S. households, their corroboration of no meaningful improvement for that key subset suggest that similar findings would be obtained for the larger group.

Army Analytics Group (AAG)

March 2017

daniel.c.Jensen.civ@mail.mil

AAG Mission

Mission: Provide analytical services for the Army's senior leadership and innovative application and data integration across the Enterprise.

Scope:

a. Provides problem solving capabilities that involve massive enterprise data integration and analysis coupled with the most advanced information technology (IT) solutions.

b. Provides research and analysis facilitation for Army organizations and other DoD organizations when approved by DUSA – network Army experts, their processes, data, and analysis tools within a secure platform environment.

Resources:

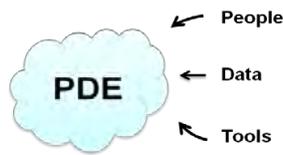
a. 16 Civilians, 3 Military Officers, 82 Contractors

b. Research Facilitation Laboratory (RFL), Medical Analysis Team (MAT)

c. Partners: HRC, CIO-G6, G2, INSCOM, CECOM, OTSG, USAPHC, AMC, JMC, 2RCC, ANC, DITMAC, NPS, TRAC, FNMOC, DMDC

2

Person-Event Data Environment

PDE is an environment which links People, Data, and Tools for problem solving.


People
Data
Tools

Using a Governance Portal **people** create projects, request data from a data catalog, get linked up to tools & connected to data for research and quick study projects – Done Right and Right Now!

PDE is an Army operated system designed by the Army, Navy, DMDC, and OSD P&R.

PDE-Apps: take the research to end users

PDE ensures Human Subject Protection Regulations, and all PII/PHI rules are followed and audited.

The **Data** in PDE (over 600 data assets and growing)

Many **Tools** available:

3

Human Capital Big Data

Human Capital Big Data (HCBD) Initiative:

- Enterprise supervision of the HCBD analysis platform (PDE) and governance framework to ensure ethical and legal use, security and interpretation of human capital data

- Consistent analytical framework (descriptive statistics, policy analysis, and research) links data to strategic outcomes such as readiness and senior leader priorities

- More research and answers per dollar - 40-60% better utilization through automation of data delivery to analysis & decision making

Enabling Factors:

- Omni-bus Use Agreements

- Streamline Governance Workflows

- Enterprise Approach to Data Knowledge Sharing & Quality Reporting

- Secure Ecosystem

4

Backup Charts

5

PDE-Enclaves

The Insider Threat Stress Rating Study will be conducted in the Person-Event Data Environment (PDE) – Development by a partnership between DMDC, Navy and Army.

PDE consists of 2 separate enclaves with separate teams:

PDE Staging   **PDE Analysis**

PDE Staging:

Extract, Load, and Transformation specialist at location A.

Receive and load data and run transformation scripts to create double encoded de-identified data for the PDE analysis enclave.

Two Person Control – CAC card and 2 people required at all times to login together and work.

PDE data loaders sign an Acceptable Use Policy (AUP) form that outlines acceptable behavior while using the PDE Staging enclave.

PDE Analysis:

Researchers at location B use analytic tools to run analysis on the double-encoded de-identified data.

Researchers have no access to encoding keys

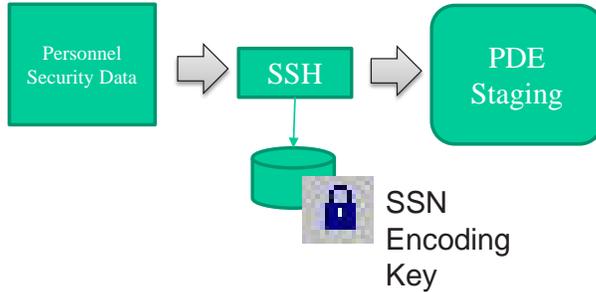
Researchers sign a PDE Acceptable Use Policy form (AUP) that states they will never attempt to link data to identify a person.

Researchers can only work within PDE

There is a multi-step process to move analysis reports out of PDE.

6

PDE Staging- Loading

PDE Loading Activities in PDE Staging Enclave:


PDE Loading:

Data from sources is loaded into PDE Staging using scrubber programs on an SSH server.

Scrubbers remove SSNs and replace with 12 digit PDE-ID code.

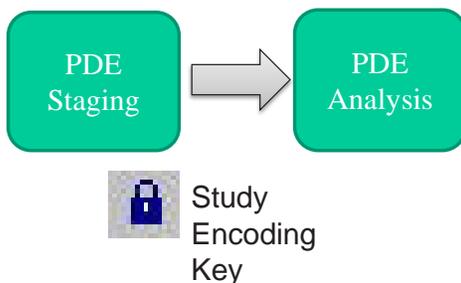
The Encoding Key (SSN to PDE-ID) is stored in separate database under 2 person control

Run scripts to identify unique columns, remove name columns if present

Remove DEERS Person-ID, Postal Addresses, Telephone Numbers, Fax Numbers, Med Record Numbers, Health Plan Numbers, Account Numbers, Device Identifiers, URLs, IP addresses, Biometric Data, Photos, weapons identifiers

7

PDE Staging - Transforming

PDE Transformation Activities in PDE Staging Enclave:


PDE Transformations:

Run Scripts to change location related data(UIC, Parent UIC, ZIP Code) into sequence or grouping codes.

Change Rank to Rank-Group and GS-Grade-Step to GS-Group and Birthday to Age-Group

Run transport script to send data to PDE analysis replacing PDE-ID with a random STUDY-ID. The

Study encoding key is stored under two person control and can not be accessed by the researchers.

Run scripts on free-text to transform to binary codes – free text is not allowed in PDE analysis

8

PDE Analysis

PDE Research Activities in PDE Analysis Enclave:

| PDE Analysis | Virtual Desktop | Researchers |

Research Teams:

CAC Login to a virtual Desktop inside PDE Analysis

Use analysis tools to conduct research (SAS, SPSS, R, Risk Rating Tool configuration)

Can not save to local workstations or drives

Cut and Paste has been disabled

Can place analysis results in a drop-directory that is then reviewed by AAG HPA for approval to transfer out of the PDE analysis enclave.

9

PDE Free Text Processing

Free Text Transformations

Free Text can be converted to a binary code.

Matrix of binary coded variables

Presence of words and phrases "alone", "loner", "keeps to her/himself"

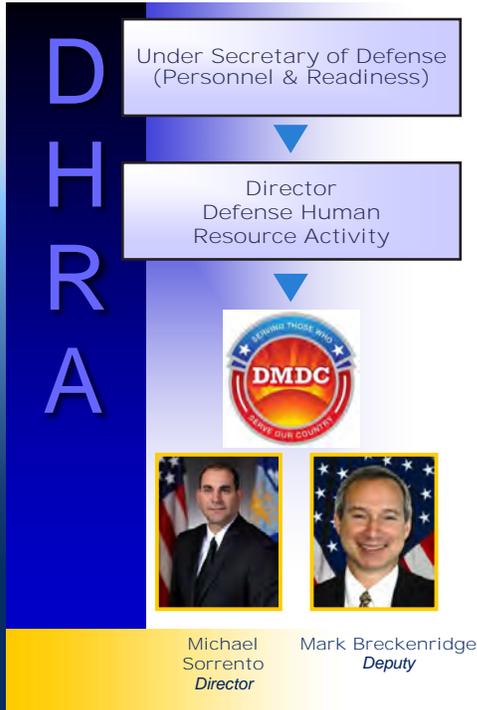
Defense Manpower Data Center Overview

Presented by:

Mark Breckenridge
Deputy Director, DMDC

- **What is DMDC?**
  - A solution provider for all things people (enterprise)
- **Why us?**
  - We have the Person Data Repository (PDR) and Local Population Databases
  - We know the data
- **What makes us stand out?**
  - We care about the people, their benefits, and their data
  - We deliver quality products on time and at lower cost than most because we are highly leveraged
  - We are passionate about our customers' business and making them successful
  - We continuously innovate

DMDC Organizational Structure


A Global Organization

Office Locations
- DoD Center Monterey Bay, CA
- Metro Washington, DC
- Boyers, PA
- San Antonio, TX
- Germany
- South Korea
- SW Asia
- Fort Knox, KY
- Dayton, OH

Personnel
- 444 DoD Civilians
- 1450+ Contractors
- 10 Service Component Liaisons

Budget FY16
- O&M Direct: $358,000,000
- Procurement & R&D Direct: $18,200,000

3   *Serving Those Who Serve Our Country*

Data Repositories

DMDC data includes the Person Data Repository (PDR), Local Population Databases and several flat files

The PDR holds information on 50 million people

The PDR includes:

- 7 Uniformed Services
- Retirees
- Medal of Honor
- ROTC

- Wounded, ill and injured
- Disabled American Veterans
- DoD and Non-DoD Civilians
- Contractors & Non-Appropriated Funded

- Foreign Military
- Family Members
- Veterans
- Patients

Local Population Databases hold an additional 2 million people

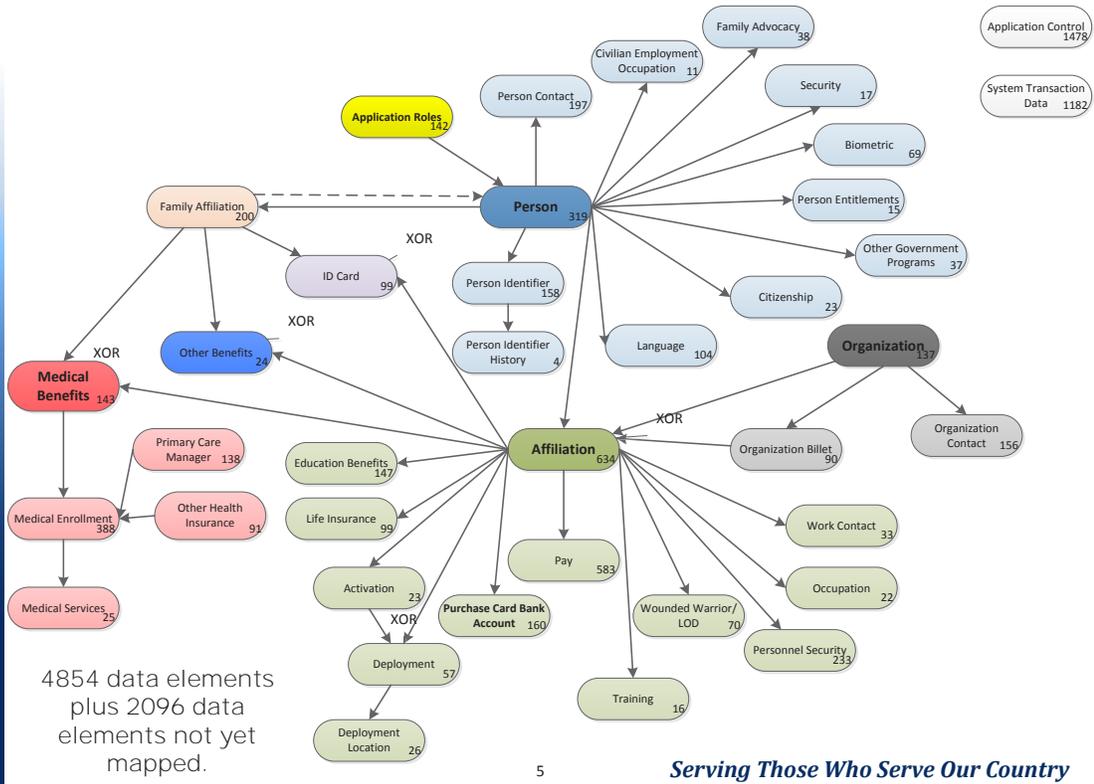
- Personal service employees, visitors, and delivery vendors at military bases*
- Contract personnel in Afghanistan and Iraq
- Persons evacuated during crisis

4   *Serving Those Who Serve Our Country*

Conceptual Data Model

4854 data elements plus 2096 data elements not yet mapped.

5

Serving Those Who Serve Our Country


The Persistent Question

"How do we leverage what we already have to enhance capability in such a way that the value offered is greater than the costs incurred?"

6

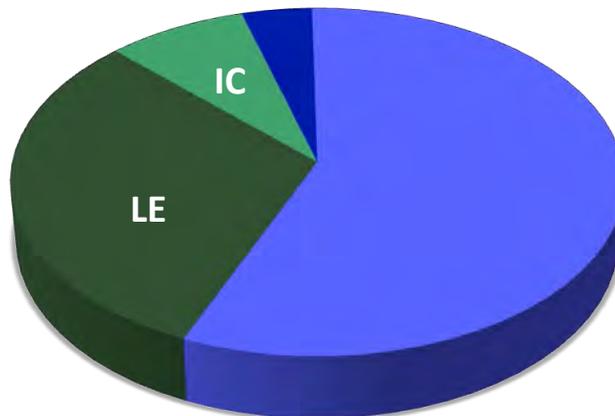
7

Serving Those Who Serve Our Country

Data Requests

DMDC provides operational and research support for over 35 federal agencies.

DMDC handles about 10,000 data requests annually.

- Identification
- Physical Location
- Skills Profile
- Affiliation Status
- Biometrics
- Contact Info


35% of data requests are Law Enforcement
and Intelligence Community

8

Serving Those Who Serve Our Country

Call Center/Beneficiary Support

- Self-service – milConnect – CAC or DS-logon
- 85,000 calls per month overall / 60,000 calls per month beneficiary
- 7.1M letters annually – moving to email
- Real-time authentication for pharmacy scripts (wholesale, retail, military, commercial)
    - Sub-second response
- Customer Care Teams for exceptional concerns/issues

9   *Serving Those Who Serve Our Country*

How can we help?

Partnership and Teaming

The heavy lifting has been done

- Serving our customers, helping them do their jobs more effectively *and more efficiently*

- DMDC is only one piece – We collaborate with many other organizations within the Federal Government to ensure that the mission needs are met.

- Collaborating with other agencies and industry partners to work toward interoperable capabilities and innovative solutions

Success through teamwork

10   *Serving Those Who Serve Our Country*

The Person-Event Data Environment: leveraging big data for studies of psychological strengths in soldiers

Loryana L. Vie[1,2] *, Kevin N. Griffith[2] , Lawrence M. Scheier[1,2] , Paul B. Lester[2] and Martin E. P. Seligman[1]

[1] Positive Psychology Center, University of Pennsylvania, Philadelphia, PA, USA
[2] Research Facilitation Team, Army Analytics Group, Monterey, CA, USA

The Department of Defense (DoD) strives to efficiently manage the large volumes of administrative data collected and repurpose this information for research and analyses with policy implications. This need is especially present in the United States Army, which maintains numerous electronic databases with information on more than one million Active-Duty, Reserve, and National Guard soldiers, their family members, and Army civilian employees. The accumulation of vast amounts of digitized health, military service, and demographic data thus approaches, and may even exceed, traditional benchmarks for Big Data. Given the challenges of disseminating sensitive personal and health information, the Person-Event Data Environment (PDE) was created to unify disparate Army and DoD databases in a secure cloud-based enclave. This electronic repository serves the ultimate goal of achieving cost efficiencies in psychological and healthcare studies and provides a platform for collaboration among diverse scientists. This paper provides an overview of the uses of the PDE to perform command surveillance and policy analysis for Army leadership. The paper highlights the confluence of both economic and behavioral science perspectives elucidating empirically-based studies examining relations between psychological assets, health, and healthcare utilization. Specific examples explore the role of psychological assets in major cost drivers such as medical expenditures both during deployment and stateside, drug use, attrition from basic training, and low reenlistment rates. Through creation of the PDE, the Army and scientific community can now capitalize on the vast amounts of personnel, financial, medical, training and education, deployment, and security systems that influence Army-wide policies and procedures.

Keywords: big data, psychological strengths, cost analysis, healthcare utilization, personnel data

As the quantity of data collected on members of the Army community (soldiers, family members, and civilian employees) continues to increase, researchers and information technology professionals are faced with a daunting task; effective management and analysis of increasingly larger pools of information with potentially stagnant or dwindling resource levels. Since 2006, the Army has incrementally developed the Person-Event Data Environment (PDE), a secure, collaborative research environment, to warehouse and study health, military service, and demographic information that is regularly collected on Army Active-Duty, Reserve, and National Guard soldiers, their family members, and Army civilian employees. This unique resource enables vetted researchers worldwide to mine this trove of data with a scientific mindset that can answer questions benefitting both the Army and wider scientific community.

This paper examines three aspects of the PDE. The first section focuses on the operating environment that gave rise to the PDE, primarily emphasizing challenges researchers have faced when working with sensitive but unclassified Department of Defense (DoD) data. The second aspect focuses on the structural design and operational capabilities of the PDE. This discussion includes the PDE's physical and logical structure, the data contained within, and the statistical tools that are made available to researchers.

Special attention is given to data sources that are most applicable to studies of psychological functioning as well as soldier outcomes that have important cost implications for the Army. The third section focuses on the types of research that may be conducted within the PDE. Where relevant, the authors have cited active research projects and multi-site collaborations. The paper concludes with a discussion of how the PDE can inform both science and policy.

OPERATING ENVIRONMENT

The PDE was created to address several challenges that researchers face when working with DoD health, military service, and demographic data. These challenges include centralization of disparate data sources into an electronic repository, providing effective data security, and making the data accessible to researchers worldwide. The subsections below address each challenge in turn and how they have influenced the PDE's development.

BIG DATA OVERVIEW

The DoD digitizes an increasing amount of soldier information every day. Within the DoD, the Defense Manpower Data Center warehouses the largest archive of soldier performance data covering more than 43 million soldiers, veterans, their family

members, and DoD civilian personnel (Defense Manpower Data Center Overview, 2012). The scope and size of these records are both steadily increasing over time as additional data elements are added and tracked. The accumulation of trillions of cells of information approaches, and may even exceed, traditional benchmarks for Big Data.

CHALLENGES WITH DATA ACCESS

The sheer existence of such a repository does not necessarily imply that the data are accessible. The Army faces the same challenges that many large organizations face – stove-piped data collected for a specific purpose but not easily repurposed; specific policies that intentionally protect privacy, restrict access, and specify uses; and hesitancy to form collaborative relationships with outsiders (Landsbergen and Wolken, 2002). With this in mind, the burden falls on individual researchers to formulate data use agreements with each data source provider. This is, at best, a tedious and lengthy process and in other instances, this can represent an insurmountable barrier to research, particularly if a data asset provider resists sharing their data. The PDE aids in this effort by making as much data as possible available without the need for project-specific data use agreements. Furthermore, data providers are becoming increasingly familiar with the PDE and previously vetted, standardized data use agreement contract language may be used to help expedite the data request process.

SECURITY OF DATA

The accumulation of large pools of data provides countless research possibilities and necessitates proper governance to prevent abuses and privacy violations (United States Government Accountability Office, 2008). For example, one can easily imagine a scenario in which a data-mining application classifies individuals on some basis of risk, grouping them into unique clusters, for instance, based on higher risk for suicide, drug use, violent crime, or some other sensitive objective criteria. Although individuals may be assigned into these higher risk groups, the assignment method will include a number of false positives due to the low base-rate of these outcomes. An accidental or intentional release of these classification results could have devastating effects on an individual's career or social standing even though no transgression of Army regulations has been (or may ever be) committed. The PDE incorporates several security and governance features to maximize data security and prevent harm to study subjects.

UNDER THE HOOD

The PDE is a secure, cloud-based research environment that provides data and software as a service. This section briefly describes the PDE system architecture, continues with a discussion of features that enhance privacy and security, and closes with an overview of the data and tools that are currently contained within the PDE.

SYSTEM AND DATA ARCHITECTURE

Figure 1 illustrates the separate security and analysis enclaves within the PDE. Only PDE administrative staff has access to the

PDE-Security Enclave, a back-end server that houses the full data resource holdings. Data is not transferred from the PDE-Security Enclave until researchers submit and receive Federal approval for a study. At this time, data (acquired from a military data source provider) is then pushed to the PDE-Analysis Enclave, which researchers can access through a remote, secure connection. The architecture detailed in **Figure 1** incorporates numerous security and privacy features to protect the data, and these features are described below.

SECURITY AND PRIVACY FEATURES

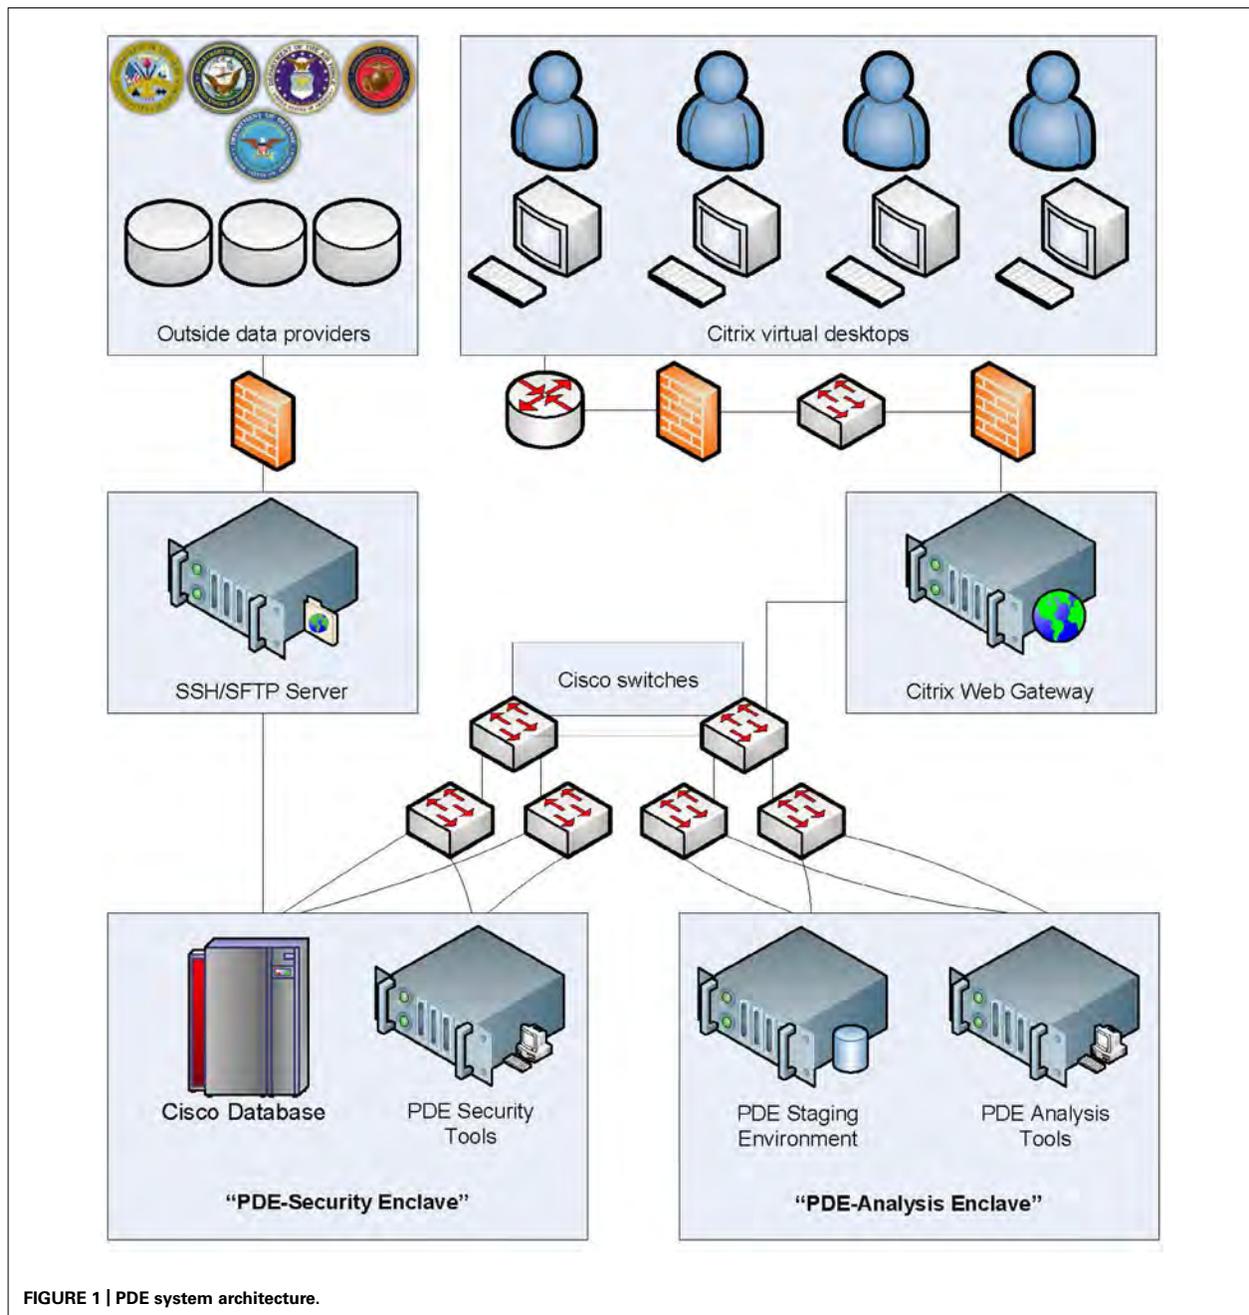
The traditional academic research model requires agencies to provide data to researchers. This creates duplication as many "ivory tower" researchers tend to work independently without drawing on shared institutional and personnel resources, let alone common data archives. Alternatively, the PDE brings researchers to the data. This is achieved through Citrix XenDesktop software, which allows users to securely access the data and software through an Advanced Encryption Standard 256-bit connection. Researchers are required to download and install a free copy of Citrix Receiver in order to use this service.

Data loaded into the PDE may not be extracted in any shape or form by researchers. Physical hardware and software limitations are in place to prevent breach of security protocols (i.e., data loss), such as no inter- or intra-net connections and no ability to copy and paste from the PDE to a user's desktop. Users may request extraction of certain allowable non-data file types (e.g., Microsoft Word® documents), at which point PDE staff will conduct a compliance review to ensure the requested files do not contain personally identifiable or protected health information. A similar vetting process is in place for uploading program or syntax files into the PDE.

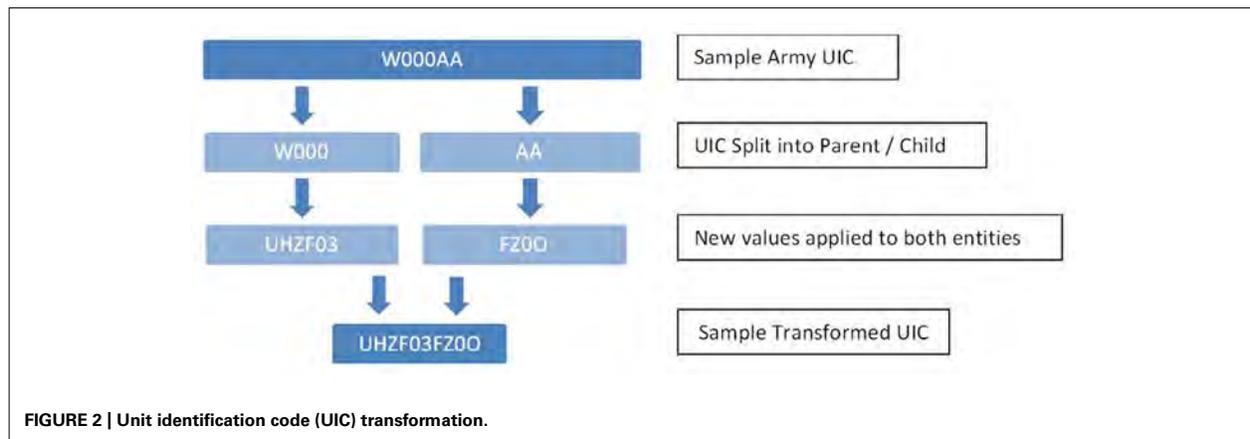
Personally identifiable and protected health information is securely transformed in order to minimize the risk of identifying individuals. Social security numbers (used to merge soldiers across time and data sources) are replaced with a random string of 12 digits that are unique to each individual and to each study. The algorithm "key" mapping this transformation is destroyed at the conclusion of the study. In addition to replacing social security numbers with a scrambled identifier, additional transformations of other personal identifiers are performed. This further reduces the risk of an individual being identified by an analyst, while maintaining enough information for standard analysis and reporting of aggregate data. For example, ranks and pay grades are condensed into groups, in some cases Julian dates are converted into YYYYMM format (or recorded only as YYYY), and unit identification codes are also scrambled. **Figure 2** diagrams the PDE procedure for transforming unit identification codes.

REGULATORY FEATURES

Regulatory and compliance oversight of the PDE is provided by the Army Human Research Protections Office, the Army's in-house equivalent of an "Institutional Review Board." The Army Human Research Protections Office provides assurances that cover protection of the rights, welfare, and well-being for human subject research conducted or supported by the U.S. Army.

FIGURE 1 | PDE system architecture.


These assurances are guided by the ethical principles set forth in the Belmont Report (Ethical Principles and Guidelines for the Protection of Human Subjects of Research) and the minimum standards set by the Department of Health and Human Services, Office for Human Research Protection regulations (45 CFR 46). In addition, Army Human Research Protections Office staff members conduct periodic assessments of current research projects to monitor compliance. More extensive compliance assurances are required for use of personally identifiable and protected health information involving medical data and covered under the standard Privacy Act regulations (Pub. L. No. 93-579) and subsequent amendments (USC Sec. 552a, Title 5, Part I, Chapter 5, Subchapter II). These assurances are further augmented by the Army human subjects policy provided in DoD 6025.18-R (DoD Health Information Privacy Regulation). Additionally, PDE staff members facilitate research by conducting "first-pass" reviews of proposals and assisting researchers with compliance questions and documentation.

FIGURE 2 | Unit identification code (UIC) transformation.


STATISTICAL TOOLS

The PDE remote desktop contains a suite of statistical, computational, and word processing tools that are made available to researchers. Currently these include Stata®, SPSS®, Mplus®, SAS® Enterprise Guide®, Toad™ for Oracle®, Qlikview®, R, and the Microsoft Office® suite. Thus, in addition to extensive statistical modeling of Army data, analysis findings can be compiled for publication (peer-review articles or technical reports) entirely within the PDE. Some software packages have a limited number of "seat" licenses available, while others such as the freely available software program, R, allow unlimited use. Additional researcher-provided software and licenses may be loaded into the PDE if the software has been issued a Certificate of Networthiness from the Army Networthiness Program. The certificate procedures are designed to protect government information systems from security threats posed by commercial and other types of enterprise software. The Army's current approved software list is not available on the web, but is publicly available through the PDE staff.

DATA AVAILABILITY

The PDE's data holdings are large and continually growing as new data assets are loaded. The holdings, currently totaling more than six terabytes (i.e., 6,000 gigabytes), are expected to double over the coming months. Currently, the PDE contains Army data on corrections and legal issues, physical fitness tests, military service information, deployments, demographics, training records, health assessments, medical visits, medical evacuations, injuries, deaths, psychological functioning, accessions, recruiting waivers, pay, and educational attainment. In the ensuing discussion we highlight datasets that can help illuminate the role of psychological assets in major cost drivers such as medical expenditures during deployment and stateside, drug use, attrition from basic training, and low reenlistment rates.

The Global Assessment Tool (GAT) is a primary tool used to assess psychosocial functioning in soldiers. Launched Army-wide in 2009, the GAT is a computerized, self-report questionnaire taken annually by all soldiers as part of the Comprehensive Soldier and Family Fitness (CSF2) program (Fravell et al., 2011). Soldiers may take the GAT up to four times a year, if desired. Upon completing the GAT, soldiers are provided normative feedback (based on a peer equivalent comparison group) on their relative strengths and weaknesses across the various psychosocial fitness dimensions. Then, as part of the CSF2 program, soldiers receive personalized recommendations for web-based trainings designed to further develop their psychological fitness. Since its inception, the GAT has been taken over 3.2 million times by over 1.3 million unique individuals (Office of CSF2, personal communication, August 26, 2013). The GAT assesses a range of psychological strengths, including self-management and coping skills, flexible thinking, positive affect, meaning, optimism, character strengths, social support, and social engagement, to name a few (Peterson et al., 2011).

Medical expenditures are major drivers of avoidable personnel costs for the U.S. Army. Tricare Management Activity is the health insurance provider for Active-Duty, National Guard, and Reserve soldiers, their families, survivors, and other eligible individuals. Tricare's data holdings represent the largest collection of electronic medical records for the military. The Medical Data Repository is a Tricare-managed database housing electronic health records for all aspects of the medical treatment process conducted stateside. The repository includes medical encounters (e.g., physician office visits), surgical procedures, prescription use, and illness diagnoses (ICD-9 codes), to list a few examples. In addition, the repository houses a number of cost variables that are familiar to health economists, such as relative value units and medical expense performance and reporting system codes. Tricare's Theater Medical Data Store maintains similar health records for services rendered while soldiers are deployed, although cost variables are not captured (but can be computed from standard economic healthcare valuation tables). Additionally, the quality and timeliness of the Theater Medical Data Store records varies as a function of the deployment environment in which the medical services are provided. For example, some medical services may be conducted informally during deployments and, as a result, are never formally documented in the data system.

Drug and alcohol abuse are also cost drivers for the Army. Costs due to substance use are not limited to direct medical care; costs are also incurred due to disciplinary action, outpatient treatment and prevention programs such as the Army Substance

Abuse Program, and discharges from the Army. Furthermore, past research has demonstrated a link between psychological functioning and substance abuse. As a group, soldiers with positive urinalysis or breathalyzer tests for illicit drug use score significantly lower on the GAT survey instrument, even after controlling for demographic differences (Lester et al., 2011a). The Medical Data Repository and Theater Medical Data Store contain records on soldiers' doctor visits and hospital services related to drug and alcohol abuse, but not all substance abuse problems result in medical treatment. Researchers may also request data from the Army's Drug and Alcohol Management Information System, which tracks positive breathalyzer and urinalysis drug tests. Additionally, the Drug and Alcohol Management Information System captures when a unit commander makes a referral for a soldier to seek treatment and whether behavioral consultation referrals are consummated.

Attrition represents another major driver of personnel costs for the Army. Information pertaining to recruits who do not complete basic training is stored in the Medical Entrance Processing Command database, accessible through the PDE. After completing basic training, thousands of soldiers leave the Army or do not reenlist for a second term at the end of their military service contract. Information on soldiers who successfully complete basic training, and then subsequently attrit from the Army, is tracked in "Transaction Files" by the Defense Manpower Data Center, which are also accessible through the PDE.

Many of these assets are still only available to fully vetted PDE users with valid data use agreements. However, researchers are currently able to request access to military service information, deployments, demographics, accessions, pay, and waivers without a data use agreement. The PDE staff continues to work toward wider data availability, which is expected to grow as data providers become more comfortable with the PDE.

RESEARCH FACILITATED BY THE PDE

This section describes three research efforts currently utilizing the strengths of the PDE. The first is a series of analyses conducted in support of the CSF2 mission, which evaluate the psychometric properties of the GAT and the efficacy of the CSF2 program. Next, we briefly discuss military-civilian collaboration between the Army, the University of Pennsylvania, and the Robert Wood Johnson Foundation. This breakthrough project seeks to identify positive psychosocial assets that enhance mental and physical well-being among U.S. Army soldiers. The third project represents collaboration between the Naval Postgraduate School and the Research Facilitation Team, which seeks to determine the cost implications of poor psychological health to the U.S. Army.

U.S. ARMY COMPREHENSIVE SOLDIER AND FAMILY FITNESS

In support of CSF2, a series of research efforts have examined the normative relations between resilience (i.e., psychological health) and a wide range of negative and positive outcomes. For example, one line of inquiry has found that soldiers who receive low GAT scores have a significantly higher propensity for suicide, psychological illness, drug use, and criminal behavior (Lester et al., 2011a; Harms et al., 2013). A different line of inquiry has linked higher GAT scores to accelerated promotions, promotion to brigadier general, selections for command assignments, and Army career fields that require professional degrees (Lester et al., 2011b).

Additionally, scientists have evaluated the Master Resilience Training (MRT) program, a "train the trainer" intervention developed to foster psychological resilience in soldiers. Exposure to MRT was associated with statistically significant increases in resilience and psychological health, and a slightly lower likelihood (11% decrease, based on the corresponding odds ratio) of being diagnosed with a mental health problem, such as post-traumatic stress disorder (PTSD; Harms et al., 2013). Furthermore, soldiers exposed to the MRT program displayed a 58% lower rate of substance abuse problem diagnoses (based on the corresponding odds ratio); significantly lower than their counterparts who were not exposed to MRT. The PDE was instrumental in facilitating access to the MRT program evaluation data assets. Furthermore, consistent with the instrumental goals of the PDE, the corresponding reductions in mental health and substance abuse problem diagnoses could represent tremendous cost-saving potential for the Army.

MILITARY-CIVILIAN COLLABORATION

In 2011, the Robert Wood Johnson Foundation awarded the University of Pennsylvania (Penn) a grant to examine predictors of positive health in the Army. A major component of this grant revolved around creating a foundation for future military-civilian collaboration. Toward this end, the Penn team began by re-examining the psychometric structure of the GAT. Confirmatory factor analysis models posited a lower-order factor structure including positive cognitions, self-management skills, positivity (affect), character strengths (e.g., warmth), and social engagement (e.g., social network; Vie et al., 2013). In addition, a higher-order model of psychological strengths adequately accounted for the moderate statistical relations among the primary factors. This more refined and parsimonious representation of GAT strengths enables more precise examination of predictors of positive health and is well suited for examining criterion-related validity. A chronometric model demonstrated that psychological assets increase in a linear and positive manner over time. Subsequent analyses have also conditioned growth in psychological assets on various deployment indices and demographic factors (e.g., gender, age). In addition, measurement invariance is being tested across various demographic subgroups, in order to identify whether GAT subscales have unique meaning for different subgroups (e.g., gender, age, education, and marital status).

The Penn team is currently studying the impact of combat deployments on psychological health. Deployment represents an important, and highly relevant, potentially stressful event that many Army soldiers experience at some point during their service. Past research has examined development of PTSD symptoms following deployment. However, rather than taking a deficit approach (i.e., assessing ill-being), Penn researchers are capitalizing on the data resources in the PDE by examining associations between deployment experiences and soldiers' levels of psychosocial strengths over time. The team is also examining relations between pre-deployment psychosocial strengths and post-deployment depressive symptoms and negative affect. Preliminary analyses reveal that having fewer psychosocial strengths

is associated with more depressive symptoms and negative affect post-deployment (controlling for early symptom levels), whereas having more psychosocial strengths is protective and associated with fewer depressive symptoms and less negative affect post-deployment.

ECONOMIC ANALYSES

Economists at the Naval Postgraduate School are working to determine the costs of poor resilience and psychological health to the Army. In addition, efforts are also underway to identify the potential economic benefits that could accrue to the Army through recruiting, training, and maintaining a psychologically healthy and resilient force. Poor psychological functioning places a significant burden on the Army (e.g., through costs related to attrition, healthcare utilization, and psychological illness), and the struggle for armed forces mental health professionals to treat illnesses following combat has been considered by some the Army's "third front" (Thompson, 2010). On this issue, Former Defense Secretary Robert Gates once declared, "health care costs are eating the Defense Department alive" (Gates, 2010). The initial phase of this research effort emphasizes four cost elements related to poor psychological functioning – attrition during initial military training, attrition before completion of first-term enlistments, increased medical usage during deployments, and a higher likelihood of receiving a diagnosis for PTSD or major depression post-deployment. Preliminary results have demonstrated a significantly higher risk of attrition for recruits that are in the bottom 10% of GAT scores, the latter treated as four dimensions assessing spiritual, emotional, social, and family fitness. Furthermore, the results include the first-ever estimate of the annual costs to the Army and DoD for treatment of PSTD and major depression. Future phases may include additional cost elements such as increased usage of medical care stateside, heightened risk of drug and alcohol abuse, increased likelihood of committing a criminal offense, and other negative soldier outcomes.

Estimates of annual Army expenditures related to the treatment of PTSD alone range from $1.54 to $2.69 billion (Cesur et al., 2011). However, these are merely estimates based on either simulations or extrapolated treatment costs obtained from civilian medical facilities. The current research program utilizes actual patient encounter data provided by Tricare to determine the actual annual expenditures that are directly attributable to PTSD and major depression. Additionally, costs of basic training are estimated at $73,000 per soldier (U.S. Army Recruiting Command, 2011). Considering that tens of thousands of Army recruits attrit during basic training and thousands more soldiers attrit before completion of their first-term enlistments, the cost of attrition quickly escalates into hundreds of millions of dollars per annum. Even small reductions in the attrition rate could result in potential savings of tens of millions of dollars each year.

Once completed, the findings from this project will enable decision-makers to determine the potential savings to the Army and DoD through increases in force-wide psychological health. Currently, researchers may only observe the costs of behavioral health programs and the subsequent changes in soldier outcomes, without knowing the true monetary value of any positive changes observed. These savings, once known, allow for more inclusive program evaluation that includes cost-benefit analysis of CSF2 or other behavioral health interventions. Military leaders responsible for making decisions regarding instituting force-wide training will then be able to observe the return on investment for such programs.

DISCUSSION

The PDE is currently set to expand significantly in the near future. This expansion entails both procuring additional data assets and physical hardware to increase PDE bandwidth. Once fully operational, the PDE represents a tremendous opportunity for scientific advancement via research and careful analysis. Those working diligently toward meeting this goal often characterize the promise of the PDE as potential energy that, if properly focused, could lead to significant breakthroughs benefitting science and humanity. Promise aside, there are a few basic tenets that must hold true in order for the PDE to become the standard for the governance of, security for, access to, and analysis of Army and DoD data.

First, we must carefully attend to the notion that the purpose of the PDE is to bring scientists to the data, rather than pushing data to scientists. Put succinctly, the data in the PDE describe one of the U.S.'s most valuable resources – the men and women of our military community – so proper governance is warranted. Second, we must continue to expand the data held within the PDE in order to keep it relevant. While the PDE likely represents the broadest range of DoD personnel data, there are many other datasets that have yet to be integrated into the PDE; such integration will be iterative as new data emerge, and it will likely take years to bring in the lion's share of existing data. Third, the PDE must be easy to use and continuously improve based on user feedback, if we expect the research community to utilize this platform. Finally, while we must be mindful of our security and privacy concerns, we must also trust our processes and governance systems if we are to meet our ultimate goal – providing access to the broader scientific community.

Keeping true to these tenets falls to the Army's Research Facilitation Team. The Research Facilitation Team – whose staff consists of research psychologists, economists, and Big Data information technology experts – was established in 2013 to not only provide governance over the PDE, but also to assist researchers in using the PDE. Given the metadata needed to navigate the vast data holdings within the PDE, this team is invaluable in shepherding new users and their projects through the data request, review, and analysis process. The Research Facilitation Team fosters collaboration within the PDE user community so that participating government organizations and researchers may survey the wide variety of work done within the PDE. This is all done with an eye toward leveraging efficiencies and reducing redundancies across research projects.

The PDE represents a rare opportunity to connect the military with the wealth of knowledge and experience contained within the wider scientific community. Working side-by-side, military and academic researchers will collaborate and examine the confluence of psychological health, soldier performance, economics, and more. The results of this research may inform Army-wide policy decisions regarding recruitment, prevention and treatment

768 The Promise of Evidence-Based Policymaking

Vie et al. Army, big data, soldier fitness

programs, job assignments, manpower training, and budgeting. The PDE represents a growing opportunity to unify science, data, and technology under one umbrella in order to bring the best information to bear on issues which have widespread implications for the DoD.

Defense Personnel and Security Research Center (PERSEREC): Overview

Eric L. Lang, Ph.D., Director, PERSEREC
Defense Personnel and Security Research Center (PERSEREC)
Office of People Analytics (OPA)

March 24, 2017

PERSEREC

PERSEREC's Mission

Improve the Effectiveness, Efficiency, and Fairness of DoD Personnel Security and Suitability Programs

2

PERSEREC – Who We Are

1986	**Since 2011**
In the wake of catastrophic espionage by John Walker and other spies, our mission was to improve the effectiveness, efficiency, and fairness of personnel security in the DoD	In the wake of events like 9-11, Ft. Hood, and the Washington Navy Yard shootings, we expanded our mission to address a broader range of human capital, insider threat, workplace safety, and security issues

Throughout our history, we have:

- Conducted long-term programmatic research for the military, security, and intelligence communities
- Provided quick-response analyses and studies in support of policy makers, systems operations, military leaders, and security practitioners
- Developed innovative tools and job aids

3

PERSEREC Six Core Capabilities (1-3)

1	**Automated Record Checks**	Support Development of Systems for Using Automated Data Sources to Improve the Vetting and Continuing Evaluation of Personnel.
2	**Emerging Indicators**	Assess the Relevance, Value, and Ethical Use of Social Media for Suitability and Security Vetting and Informing Health and Wellness Programs (e.g., Suicide Prevention).
3	**Special Policy Initiatives**	Inform Senior Decision-makers with Quick Response Studies and Analyses in Support of Improved Policy and Processes, e.g., on security risks associated with certain mental health conditions.

4

PERSEREC Six Core Capabilities (4-6)

4	Security and Suitability Vetting Support	Improve Suitability and Personnel Security Vetting Processes through Development of Requirements, Standards, and Processes that Comply with Policy and Meet DoD Needs.
5	Insider Studies	Be an Authoritative Source of Information on Espionage, Terrorism, Workplace Violence, and Other Insider Threats and Develop More Effective Systems, Tools, and Interventions to Prevent, Detect, and Mitigate Activities that may Cause Harm to National Security.
6	Data Science & Advanced Analytics	Apply Advanced and Big Data Analytics to Human Capital, Security, and Cost Issues

5

Insider Risks, Motivations & Behaviors Vary

"Insider risk": Security & safety risks associated with trusted government employees, military personnel and contractors

- **Espionage/leaks**
  e.g., cleared employee provides classified info to a foreign group
- **Terrorism/violence**
  e.g., radicalized military personnel turns violent
- **Vandalism/disruption**
  e.g., vengeful employee harms his organization's computer system
- **Reliability problems and gross negligence**
  e.g., employee with alcohol/substance abuse, psych problems, or gross incompetence fails to protect sensitive info/systems

6

Examples of FY16 Studies Conducted at PERSEREC

7

Evaluation of Foreground Factors in the Shaping of Insider Threats

Issue: Insider threat prevention and research efforts have focused on identifying early warning signs of individual behavior rather than taking into account factors in the organizational environment which may influence insider threat behaviors, particularly workplace violence

Context: Despite 79 recommendations from the Fort Hood review board 2010 report, dangerous incidents at military installations have continued

- 2012 Fort Bragg, North Carolina – 1 dead
- 2013 Washington Navy Yard – 4 wounded, 13 dead
- 2014 Fort Hood, Texas – 12 wounded, 4 dead

8

Method: Conduct a comparative case study of ~10 lethal targeted workplace violence cases by military, DoD civilian or contractor personnel within the last 5 yrs.:

- Describe the background and environmental factors
- Describe the effectiveness of efforts to intervene

Outcome: The current effort will provide policy makers at OUSDI with greater understanding of how foreground factors shape insider threat behavior. Pending success/interest PERSEREC could then:

- Recommend policies and/or follow on research
- Develop training and communication materials

9

Incorporating PAEI into Continuous Evaluation (CE)

Issue: Is Publicly Available Electronic Information (PAEI), e.g., social media, a viable data source for CE?

Context: Previous research found that PAEI can provide uniquely relevant information that can help inform the personnel security decision-making process (Rose & Whiteley, 2014).

- Individuals disclose information on social media platforms that they may not share anywhere else
- FBI checks are limited but information about arrests, charges, and convictions can be found online
- Social media data can provide additional contextual information

10

Method: Obtain a random sample of 4,000 subjects from the CE population and conduct baseline PAEI checks. Select a sub-sample of 1,250 subjects and conduct CE PAEI checks.

Outcome: Identify the type and frequency of adjudicatively-relevant behaviors that occur online, evaluate the timeliness and uniqueness of the information, and assess the workload impact to determine if PAEI is a suitable data source for CE.

11

Policy, Process, and Adjudication of Mental Health Information in Personnel Security Vetting

Issue: Question 21 (a series of mental health Qs) on the Personnel Security Questionnaire (SF-86) is being revised and DoD needs to understand the extent to which the current system is capable of handling the new information solicited by the revised question.

Context: The revised Q21 will allow for a more relevant collection of mental health information from the subject
- OMB preparing for public comment on Q21 in Federal Register
- New Q21 is based on PERSEREC's "Relevant Risk Approach"
- Goal is to obtain more productive and verifiable information for investigation and adjudication of mental health issues

12

Method: Use of a combination of literature and policy reviews, and interviews with experts, to:

- Outline current investigative and adjudicative policies and procedures
- Evaluate if current processes are adequate for handling info collected under the revised Q21
- Use experts and literature to identify best practices for addressing gaps

Outcome: The current effort will provide policy makers with recommendations for handling information collected under the revised Q21

- Changes to standard operating procedures for investigators, adjudicators, and evaluating psychologists

13

Data Science Exploration of DMDC Data Sources for Modelling and Improving Personnel Systems

Issue: DMDC houses a variety of data that could be useful for understanding suitability issues, Continuous Evaluation (CE) and military attrition but research is needed to evaluate it.

Context: Data Science technologies and advanced analytics can be used to develop algorithms for analysis of data across data sources to identify key indicators and predictors of behaviors of security, suitability and manpower concern.

14

Method: Gather data on a sample of DoD personnel and conduct analysis.

- Code and extract data
- Analyze data using data science technologies and advanced analytics
- Develop and test algorithms

Outcome: This effort could provide evidence-based recommendations for policy makers and operations managers at OUSD(I) and OUSD(P&R) regarding how to incorporate DMDC data into Systems related (for example) to CE, suitability and military attrition.

15

A Few Insider Threat Overarching Insights

- Indicators of personnel concern are often ambiguous. Appropriate reporting and follow-up are critical

- Initial screening is important, but continuous evaluation/monitoring is more important

- Need to fuse relevant, appropriate and legal indicators from multiple sources, e.g., classic record checks (such as FBI, travel, credit), social media, employee work network monitoring, local/HR records, & coworker/supervisor reporting

- Policies and technologies are necessary but not sufficient. Effective training, personalization and organizational climate are key to managing risk

16

PERSEREC Customers and Stakeholders

PERSEREC's customers and stakeholders include policy-makers at:

- OUSD(P&R), e.g., Civilian & Military Personnel Policy • Sexual Assault Prevention and Response Office • Defense Suicide Prevention Office
- OUSD(Intelligence), e.g., Security Policy and Oversight Directorate
- OUSD(Policy), e.g., foreign student vetting
- DoD component Personnel Security and CI policy offices
- DoD Joint Central Adjudication Facility

Outside of DoD, PERSEREC's customers/stakeholders include:

- Office of Director of National Intelligence—Federal Security Executive Agent
- Office of Personnel Management—Federal Suitability Executive Agent
- Others (e.g., DOE, DOS, DHS, CIA, FBI, OMB, GAO, PAC)

17

Success Stories

Success = Implementation of PERSEREC recommendations and tools

- Production and revision of the National Adjudicative Guidelines specified in E.O. 12968
- Phased Periodic Reinvestigation (PPR) method for continuing TOP SECRET access eligibility
- Electronic adjudication ("eAdjudication") of clean SECRET cases
- Tools for evaluating the quality of investigations and adjudications
    - RAISE: Rapid Assessment of Incomplete Security Evaluations
    - RADAR: Review of Adjudication Documentation Accuracy and Rationales
- Automated Continuous Evaluation System (ACES) for clearances holders
- Tools for security and intel professionals (e.g., "Adjudication Desk Reference," "Customizable Security Guide," and "Insider Risk Evaluation and Audit Tool")
- Espionage trend analyses (e.g., "Changes in Espionage by Americans 1947-2007")
- DIRE: "Dispositional Indicators of Risk Exposure" [DIRE] tool for assessing personality characteristics that are security and safety risks
- DoD adjudicator certification standards and procedures

Examples: The PPR and eAdjudication have saved the DoD more than **$250M**

Public Policy

Using Big Data to Study and Improve Military Health and Manpower Management

Yu-Chu Shen, PhD
Professor of Economics
Graduate School of Business and Public Policy
Naval Postgraduate School
Faculty Research Fellow
National Bureau of Economic Research (NBER)

My Research Area

NAVAL POSTGRADUATE SCHOOL
Graduate School of Business & Public Policy

- Linking large scale databases to address economic issues related to health:
  - Economic analysis of mental health issues in the US military.
  - Evaluating system-level changes in the health care markets and their effects on provider behaviors and patient care
  - Public health infrastructure and population health outcomes

Example 1: Evaluating PTSD

NAVAL POSTGRADUATE SCHOOL
Graduate School of Business & Public Policy

- Evaluating GWOT's effects on PTSD incidences
  - » What are the rates of PTSD among all active duty enlisted personnel and how do the rates differ by service and deployment location?
  - » How do deployment location and length of deployment affect the probability of being diagnosed with PTSD?

NAVAL POSTGRADUATE SCHOOL
Graduate School of Business & Public Policy

Background

- Post-traumatic stress disorder (PTSD) has risen steadily since the start of GWOT.
- Understanding the risk factors would allow focused preventative measures for those at a higher risk.
- Could aid planning optimal tour length and tour rotation to minimize the risks of developing PTSD.

NAVAL POSTGRADUATE SCHOOL
Graduate School of Business & Public Policy

Data

- Defense Enrollment Eligibility Reporting System
  - Identify the active duty personnel population and obtain demographic and service information
- TRICARE
  - Standard Inpatient Data Record, Standard Ambulatory Data Record, Encounter Data.
  - Identify the date that PTSD was first diagnosed and related health information
- Contingency Tracking System
  - Identify OEF/OIF deployment characteristics and military occupational specialty (MOS) codes

NAVAL POSTGRADUATE SCHOOL
Graduate School of Business & Public Policy

Outcome of Interest

- The dependent variable in our analysis is whether an enlisted person was diagnosed with PTSD anytime between 2001 and 2006
- Binary variable: =1 if the ICD-9 code of the principal diagnosis is 309.81

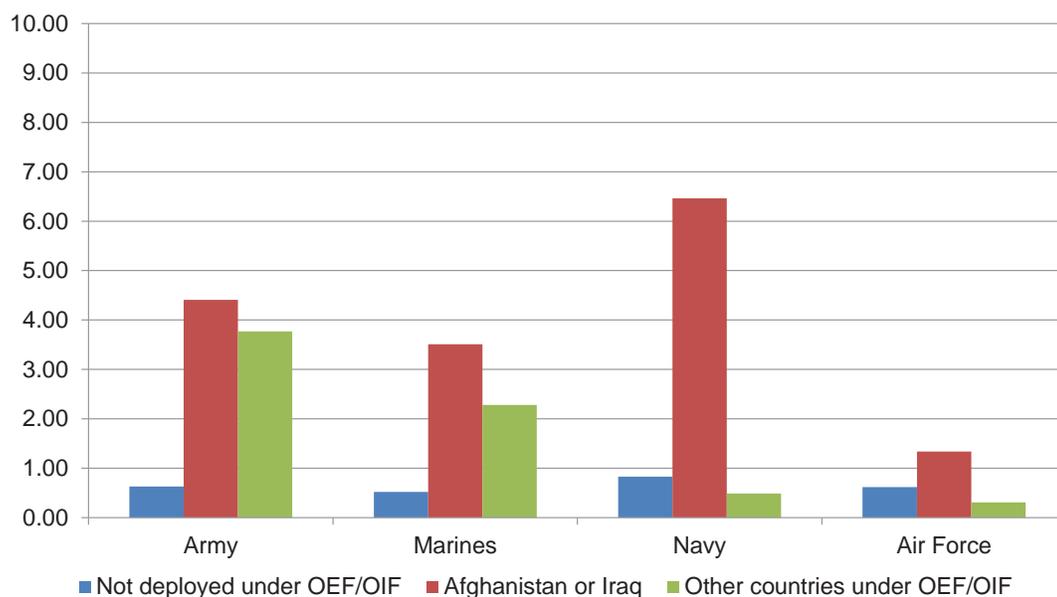
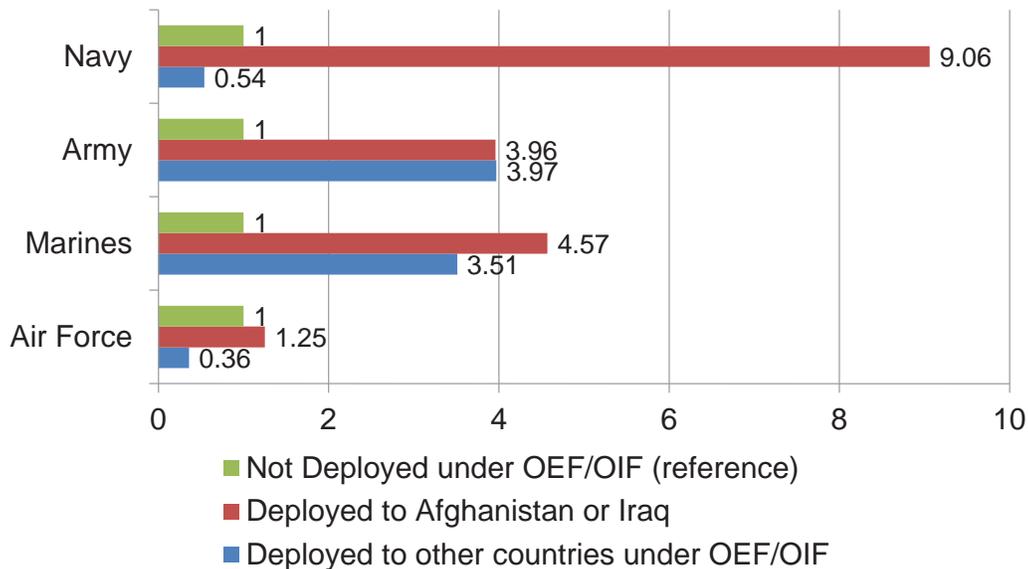
Rate of PTSD By Deployment Location

Legend: ■ Not deployed under OEF/OIF ■ Afghanistan or Iraq ■ Other countries under OEF/OIF


Logistic Regression Results: Odds Ratio of PTSD By Location


Challenges

- Extremely length DUA review
  - 2 years for initial approval, not possible to do timely research
  - Rule changes on yearly basis
- Linking critical database to capture complete medical history
  - Most likely miss more severe cases of PTSD because there is no linkage to VA
  - Many critical health related databases do not share common scrambled ID

The U.S. Army Person-Event Data Environment: A Military–Civilian Big Data Enterprise

Loryana L. Vie,[1,2,*] Lawrence M. Scheier,[1,2] Paul B. Lester,[2] Tiffany E. Ho,[1,2] Darwin R. Labarthe,[3] and Martin E.P. Seligman[1]

Abstract

This report describes a groundbreaking military–civilian collaboration that benefits from an Army and Department of Defense (DoD) big data business intelligence platform called the Person-Event Data Environment (PDE). The PDE is a consolidated data repository that contains unclassified but sensitive manpower, training, financial, health, and medical records covering U.S. Army personnel (Active Duty, Reserve, and National Guard), civilian contractors, and military dependents. These unique data assets provide a veridical timeline capturing each soldier's military experience from entry to separation from the armed forces. The PDE was designed to afford unprecedented cost-efficiencies by bringing researchers and military scientists to a single computerized repository rather than porting vast data resources to individual laboratories. With funding from the Robert Wood Johnson Foundation, researchers from the University of Pennsylvania Positive Psychology Center joined forces with the U.S. Army Research Facilitation Laboratory, forming the scientific backbone of the military–civilian collaboration. This unparalleled opportunity was necessitated by a growing need to learn more about relations between psychological and health assets and health outcomes, including healthcare utilization and costs—issues of major importance for both military and civilian population health. The PDE represents more than 100 times the population size and many times the number of linked variables covered by the nation's leading sources of population health data (e.g., the National Health and Nutrition Examination Survey). Following extensive Army vetting procedures, civilian researchers can mine the PDE's trove of information using a suite of statistical packages made available in a Citrix Virtual Desktop. A SharePoint collaboration and governance management environment ensures user compliance with federal and DoD regulations concerning human subjects' protections and also provides a secure portal for multisite collaborations. Taking similarities and differences between military and civilian populations into account, PDE studies can provide much more detailed insight into health-related questions of broad societal concern. Finding ways to make the rich repository of digitized information in the PDE available through military–civilian collaboration can help solve critical medical and behavioral issues affecting the health and well-being of our nations' military and civilian populations.

Key words: electronic medical records; epidemiology; military; Person-Event Data Environment; physical health; population health; soldier; well-being

Introduction to the Person-Event Data Environment

The U.S. military has compiled a vast, secure computer repository of digitized information that documents the full breadth of a service member's military experience. Modern record keeping of military experience—in computerized formats easily usable today—began in the late 1990s. Since then, the U.S. military has collected extensive service member information obtained from entrance exams (e.g., personality and aptitude), required annual physicals, pre- and post-deployment health assessments, medical and hospitalization treatment records, and periodic assessments of psychological functioning, job

performance, and military service qualification tests. The Person-Event Data Environment (PDE) business intelligence platform is a cloud-based virtual data repository for housing this digitized information. The PDE was established by the U.S. Department of the Army to facilitate research and analysis of issues and policies that affect the military workforce—Active Duty, Reserve, National Guard, civilians, and contractors. Though research and analysis projects from all services are emerging in the PDE now, the system is primarily used by the Army, and therefore we will limit the current discussion to that service. In its current form, the PDE informs senior military and civilian government leadership and policy makers about a variety of human resource-related issues, including the health of the force, training program efficacy, and return on investment, selection, and attrition. Furthermore, the PDE addresses a critical need as the Army modernizes and engages novel behavioral health interventions to improve Army military service. Researchers can use the PDE to conduct program evaluation, cost-effectively pooling military data assets across numerous facets of a study. Findings of such studies can be highly informative for policy development and evaluation regarding health and healthcare issues in the civilian population as well.

Functionally, the PDE serves two central purposes: (1) acquire, integrate, and securely store data for Army-approved research projects, and (2) provide a secure, virtual workspace where approved researchers can access "sensitive" although unclassified Army military service, performance, manpower, and health data. Figure 1 depicts a computer screenshot of the PDE SharePoint environment, which serves as both a governance portal and a collaborative environment for researchers (both within and across projects).

The PDE was initiated in 2006 as a business intelligence platform with an initial goal emphasizing command workforce, critical skill resource assessment, and outcome studies. Other government organizations soon recognized the power of a collaborative "commons" offered by the PDE technology. Specifically, the Defense Manpower Data Center began contributing data and computational resources to the PDE, and other armed forces branches began approaching the Army for PDE access. Following its rapid expansion and utilization, the Army Human Research Protections Office (AHRPO) and the U.S. Army Public Health Command were recruited to help configure standardized governance procedures to ensure human subjects' protection and regulatory oversight. The Army has applied additional resources through the Research Facilitation Laboratory, a behavioral science unit created to help the commons repurpose PDE data for operational studies and to promote scientific advancement.

Opportunity

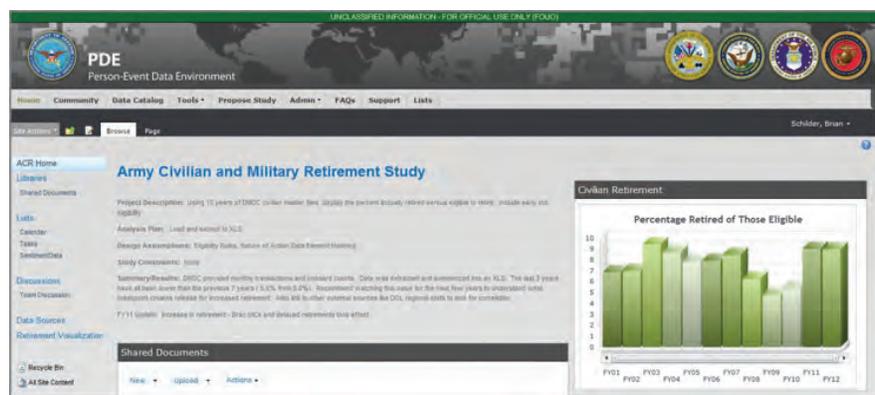
In 2011, the Robert Wood Johnson Foundation (RWJF) funded the University of Pennsylvania's Positive Psychology Center to create a sustainable military–civilian collaboration accessing PDE data assets. This *proof-of-concept* research project examines the role that psychological health assets (e.g., optimism and positive affect)


FIG. 1. Screenshot of the PDE SharePoint environment. Source: Reproduced with permission from the U.S. Department of the Army, Army Analytics Group, 2014.

play in various health outcomes and healthcare utilization.[1–3] The project research team consists of a steering committee involving both Army and academic scholars, a cadre of senior scientists, and project management on-site accessing data through secure Army portals. Collaboration between all these components has resulted in eight fundamental areas of scholarly inquiry: (1) mental health, (2) physical health outcomes (e.g., cardiovascular functioning), (3) attrition, (4) substance use, (5) deployment-related events (i.e., trauma and concussion-related traumatic brain injuries), (6) post-traumatic stress disorder, (7) criminal behavior, and (8) healthcare costs.

In addition to cost-efficiencies, the PDE provides useful alternatives to the many pressing challenges faced by behavioral and medical researchers. For one thing, national and longitudinal research studies are logistically cumbersome, relatively expensive, and time-consuming. Soldiers provide a vast amount of behavioral and medical data on a routine basis as part of regular monitoring, as well as ongoing personnel and manpower data for practical force considerations. The Army can use this information to detect mission-critical issues, including the preparedness of its forces, their suitability for combat, and the effects of Army service on soldier functioning, including manifestations of prolonged deployment.

The ability to analyze Army data on soldier performance under one computational "roof" is attractive for several other reasons. Cohorts are often limited to a particular geographic region or specific occupational group (e.g., nurses), limiting their overall generalizability. Soldiers, on the other hand, ostensibly come from all walks of life, from geographically diverse neighborhoods, represent a heterogeneous sociodemographic profile, and present for medical care with different behavioral and health maladies influenced by many factors, including family history, gender, race, age, occupation, and training regimen, to name a few. This variety alone provides a veritable-rich environment for studying human behavior and aggregates this information at the population level. A good deal of the knowledge gained from using the PDE will find application in comparable populations and, as a result, the collaborations will provide a cost-effective means through which scientists can create lasting solutions to new and continuing health problems.

Other opportunities arise from the continued monitoring of soldier performance, health, and psychosocial functioning. Disease registries typically recruit participants after a medical condition or ailment of interest is present, obscuring prospective markers with etiologic

importance. Also, stressful or traumatic events are difficult to anticipate and, as a result, are often studied only retrospectively, resulting in inconsistent data collection efforts. Data stored in the PDE provide a plethora of information from initial accession through eventual separation from the Army, providing a means to monitor soldier functioning from emerging adulthood through later life for career soldiers. A bulk of the Army is relatively young (17–30 is the largest single demographic group and in 2014 constituted 64% of Active Duty soldiers) providing a unique trove of data that can inform social policy for years to come. From a life course perspective, this is a critical age group experiencing transition from adolescent to adult health, a point at which trends of unfavorable or continued favorable trajectories of adult health diverge. Policies for health promotion and disease prevention are therefore especially likely to be informed by new knowledge generated by investigations based on this unique data resource.

How Big Is Big?: Data Complexity and Survey Frequency

One pressing question is whether the Army PDE is really managing big data in the usual sense. The census of Army strength on an annual basis hover around 1.2 million soldiers including all three major components (Active Duty, Reserve, and National Guard). The PDE, which maintains an ongoing cumulative record of military personnel, is several times this size due to retention of some and constant recruitment of new members to the population. By any stretch of the imagination, and when compared to federal government data bases (e.g., Treasury Department, Social Security, and Labor Statistics), social networking sites (e.g., Twitter, Google, and Facebook), or commercial data processors of financial information (e.g., Heartland Payment Systems or Global Payment Systems), the PDE is not necessarily large. However, additional considerations perhaps qualify Army data as "big." For one thing, soldiers' data in the PDE is longitudinal following their military service from point of entry to discharge or normal termination (the latter including injury or death). Owing to the digitization of Army records from 1990 forward, this means that several million soldiers can be examined longitudinally in the PDE. Second, as we outline below, soldiers provide a wealth of data on many different facets of their training, health, and functioning. The health records alone include a vast array of information pertaining to doctor's visits, hospitalization, medication dispensed, and associated insurance data recording, among other items, the medical

reason for the visit, the diagnosis reported for billing purposes, and the cost of the visit to the medical treatment facility. Thus, the PDE can house upward of 10,000 or more variables collected on a single soldier accumulated through the duration of military service. This contrasts with the more limited financial and address information that commercial data processors possess on any particular individual. Finally, soldiers operate as individuals embedded in units as small as squads and as large as brigades or divisions. This "unit of observation" results in nested or hierarchically clustered data, owing to the similarity of soldier behavior within as opposed to across different intact social units. Nested data provide an opportunity to examine social influence processes and also whether certain behavioral training programs or leadership styles are more or less beneficial based on aggregate soldier profiles.

Another data complexity arises given the great variability when soldiers enter and leave the Army, deploy, and receive routine and nonroutine health assessments. To illustrate, PDE data assets consist of assessments gathered routinely (e.g., weapons qualifications), on a periodic basis (e.g., annual health assessments), as well as event-based (e.g., pre- and post-deployment health assessments). Although periodic health assessments (PHAs; annual physicals) are typically evenly spaced, routine assessments can be delayed based on the timing, location, and duration of a soldier's deployment. The lack of equal time intervals in the spacing between assessments can be methodologically challenging, particularly for researchers invested in modeling developmental change using time-structured assessments, although these challenges can be addressed statistically using alternative random coefficient modeling procedures.

Imposition of Sample Selection and Gating Criteria

The tremendous variability that exists in the timing of military health and behavioral assessments necessitates careful consideration of how to manage such large amounts of complex data. One solution has been to create replicable "gating criteria" that delimit samples. These take shape as Oracle Structured Query Language (SQL) queries to establish precisely which soldiers meet the time (during which military-related events may transpire) and assessment windows (which assessments are mandatory during a specified time frame). There are also service criteria, for instance, the precise component of service (Active Duty, Reserve, or National Guard) and whether a soldier deployed to Iraq or Afghanistan or some other region or combat zone. The ultimate objective of gating is to create a uniquely definable "cohort." These cohorts can then be examined using traditional longitudinal data mining approaches, including survival analysis, growth modeling, fixed-effect structural equation modeling, and ordinary least squares regression to ascertain effects over time. The gating criteria offer a way of managing the variability that characterizes soldier service records, while at the same time offering a rigorous means to detect periodicity and regularity often encountered with longitudinal data.

To illustrate, a recent study employed SQL queries to elucidate the contribution of deployment combat stress to alcohol consumption, medical symptoms, and a positive screen for posttraumatic stress disorder (PTSD). These are important areas for scientific inquiry as well as major costs drivers for the Army. Understanding these cost drivers can be explored through intelligent querying of the database, which involves specifying selective gating criteria that reveal interesting data patterns related to health and cost for such criteria.

As an example, the following gating criteria were applied sequentially to the database: (1) deployed between September 2012 and December 2014 ($n = 154,340$), (2) completed the required pre- and post-deployment health assessments ($n = 46,176$), (3) had taken a self-report survey assessing psychosocial functioning roughly a year prior to deployment ($n = 14,294$), and (4) were between the ages of 18 and 30 ($n = 10,058$). This netted a cohort of soldiers that had deployed during a specific time frame, were young adults, and had completed the required psychosocial and health assessments. The study was framed by learned helplessness theory, which states that depression and related mental illnesses result from perceived absence of control over the outcome of a situation and an exaggerated sense of helplessness or negativity.[*] In this study, an attributional tendency termed "negative explanatory style" was assessed using a self-report measure of "catastrophic thinking," which can be thought of as ruminating about worst case outcomes.[†]

To test linkages between combat stress and poor health outcomes among the panel soldiers we assessed the relative contribution of deployment combat-related stress, catastrophic thinking, and three demographic control measures (age, gender, and rank). Soldiers

---

[*]http://en.wikipedia.org/wiki/Learned_helplessness
[†]https://www.psychologytoday.com/blog/in-the-face-adversity/201103/catastrophic-thinking

who reported any one of seven combat-related stressors (e.g., "encountered dead bodies," "discharged a weapon," and experienced a blast") were coded accordingly. A measure of catastrophic thinking was obtained from a self-awareness tool soldiers take annually. Sample items included "when bad things happen to be, I expect more bad things to happen" and "when bad things happen to me, I cannot stop thinking about how much worse things will get," which were scored on a five-point Likert-type scale.

Outcome assessments were based on a 17-item PTSD symptom index[4] (cut-point of 30 or more indicated 'at risk'), a three-item alcohol misuse screener[5] (ranging from 0–12), and a 29-item index of general health concerns (ranging from 0–29). Controlling for age, rank, and gender the findings indicated that combat-related stress (trauma) was significantly related to a positive screen for PTSD (odds ratio [OR] = 3.11, 95% confidence interval [CI] = 2.37–4.08, $p < 0.0001$), alcohol misuse ($\beta = 0.07$, $p < 0.0001$), and more health concerns ($\beta = 0.21$, $p < 0.0001$), respectively. Catastrophic thinking also placed soldiers at risk for all three outcomes (PTSD: OR = 1.18, 95% CI = 1.02–1.37, $p < .05$; alcohol misuse: $\beta = 0.03$, $p < .01$; and health concerns: $\beta = .07$, $p < .0001$). Structured queries like the one used here: 1) reinforce the necessity of modeling heterogeneous measures of military experiences; and 2) highlight the potential need for tailoring current health promotion programs to address possible subgroup differences in military-specific outcomes.

Measures

From their initial point of entry into the Army (accession), soldiers provide continued (semiroutine) information on their health, psychological functioning, vocational aptitude, personality, fitness, and training qualification. There are ancillary data sources that track mandatory officer evaluations, military and civilian education, and soldiers who seek alternative training through special operations training and aviation schools. This wealth of data can provide a composite picture of a soldier's life and be used for operational studies or research purposes. Table 1 includes an overview of several key Army health data assets that are fundamental to the RWJF military–civilian collaboration. The table illustrates the basic content for each asset, the primary source of the health data (e.g., self-rated reports), and the administration sequence for each assessment (periodic or event-based).

As an illustration of how resourceful the PDE can be, we now present a detailed overview of one of the health

data assets, the PHA. Active component and select Reserve personnel are required to receive an annual PHA. The PHA is a standardized preventive screening tool designed to improve the reporting and visibility of the individual medical readiness describing each soldier's physical ability to deploy. Specifically, this assessment consists of three integrated steps: (1) an online Health Risk Assessment (e.g., family history, medical conditions, and current medication use) with referrals made for laboratory studies and immunizations, (2) support staff review the personal medical information (e.g., height, weight, and medications), and (3) a healthcare provider reviews each soldier's statement of health, evaluates any required laboratory results, performs a medical symptom-focused exam, rates body system functioning using the medical physical profile serial qualification system, and provides referrals for additional medical services as indicated.

Over 600 data elements are collected during this three-step assessment process, approximately 107 of which contain administrative (e.g., "date PHA form approved") or personal information (e.g., soldier's telephone number). As we discuss in the following sections, personally identifying information can never be examined for research purposes. The health data in the PHA database can be categorized as follows: allergy information, 43 variables (e.g., reports allergy to iodine); behavioral health information, 43 variables (e.g., reports feeling down); clinical evaluation, 119 variables (e.g., diastolic blood pressure); overall health, 87 variables (e.g., soldier has chronic pain); family history, 115 variables (e.g., father had cancer); medications, 18 variables (e.g., "class of drug"); preventive health, 74 variables (e.g., frequency of alcohol use); and functional capacity, 18 variables (e.g., score for physical capacity or stamina). Across a five-year career, this represents over 2,500 soldier health data elements that can be gathered and made available to researchers as de-identified data. Even more impressive is the fact that these data elements can be merged with other longitudinal databases housed in the PDE, enabling researchers to examine contextual factors (e.g., psychosocial strengths, deployments, years of service, and job performance, to name a few) that may relate to health at specific points in time.

Utility of the PDE

Current use of the PDE generally falls into three categories: novel research, organizational analysis, and program evaluation. In terms of novel research, the PDE is

Table 1. Person-Event Data Environment health data assets

Database	Description of contents	Primary source	Admin.	Pop.
Deployment Health Assessments	Health before and after deployment (e.g., self-rated health, alcohol and tobacco use, PTSD, depression, combat exposure, injury and concussion risk, health concerns, major life stressors, Rx use, environmental and exposure concerns, suicide ideation, violence or potential for self-harm)	Self-rated & objective	Event-based	S
Digital Training Management System	Comprehensive training records (e.g., marksmanship training, predeployment training), physical fitness metrics (e.g., push-ups, sit-ups, two-mile run, participation in a weight control program)	Objective	Event-based & periodic	S
Drug & Alcohol Management Information System	Positive drug and alcohol screens (e.g., urinalysis, breathalyzer), referrals and enrollment in treatment, patient follow-up, and progress	Objective	Event-based	S
Electronic Physical Evaluation Board	Physical Evaluation Board key dates (e.g., date started, referral date, approval date, date placed on TDRL), disposition of the board, overall percentage of disability, description of condition	Objective	Event-based	S
Medical Data Repository	Electronic health records (e.g., appointment dates, Rx medications, procedures and surgeries, vitals [e.g., blood pressure], healthcare costs, pathology laboratory results)	Objective	Event-based	S, D
Periodic Health Assessment	Yearly physical assessments (e.g., overall health, clinical evaluation, medications, family history, behavioral health, preventive health, physical profile, deployability)	Self-rated & objective	Periodic	S
Social Security Admin. Death File	Death date, death verification code, last residence (state)	Objective	Event-based	S
ArmyFit—Global Assessment Tool	Psychological strengths (e.g., adaptability, positive/negative coping, catastrophizing, social engagement, optimism, meaning, character, depression, positive & negative affect, family satisfaction, family support, work engagement, friendship, loneliness, organizational trust), health, health-related behaviors (e.g., cigarette smoking)	Self-rated	Periodic	S, D, C
Theater Medical Data Store	Electronic health records during deployment (e.g., appointment dates, medications, procedures, injury type, illness diagnostic categories, symptoms, blood pressure, pulse rate, temperature)	Objective	Event-based	S

being used for a wide variety or research projects examining the health- and work-related behaviors of members of the military. For example, a recently published study using PDE data assets analyzed data from the Army's Global Assessment Tool (GAT) and found that high-performing soldiers tended to report relatively higher GAT scores on measures of psychosocial functioning (i.e., optimism), whereas soldiers with behavioral problems tended to have relatively lower GAT scores[6]; this study reinforced the practical utility of the GAT as a psychometric instrument. Other research studies in the PDE are underway now, including research designed to model military family resilience, feasibility studies for the use of social media data for suicide prevention, the development of risk algorithms

for a range of behavioral problems, and research examining how leadership behaviors can influence follower psychological health.

There are also questions about population cardiovascular health and the different approaches to investigating these important medical considerations that offer another example of the utility and significance of the PDE for conducting novel research. As previously stated, the Army is a large, racially and ethnically heterogeneous population with diverse age groups from as young as 17 through later middle life (ages 60–70). As such, the extensive inventory of personal-level data on cardiovascular health status, health behaviors, psychological factors, and social determinants of health provides an exceptionally rich existing data set

regarding relations among these health factors and potential strategies for cardiovascular disease prevention. Record linkage for individuals throughout their military careers provides opportunities for longitudinal as well as cross-sectional examination of these relationships. Health-related policy changes within the Army can be proposed, developed, implemented, and evaluated through ongoing investigations with these data. The applicability of findings to the civilian population and the opportunity to make direct statistical comparisons to the civilian population add further value to this exceptional health data asset.

For example, one line of effort has recently examined PHA data in the PDE to contrast measures of health among Army Active Duty, Reserve, and National Guard soldiers, and civilians from the National Health and Nutrition Examination Survey. Appendix I provides a case study that showcases comparisons on several health metrics that are major cost drivers for both the Army and general population.

Additionally, the PDE is used to perform a range of organizational analyses to answer questions posed by the Department of Defense's (DoD's) senior leadership as well as members of the U.S. Congress. The PDE was recently used to respond to inquiries from Congress about demographic characteristics of service members within the DoD. In addition, the PDE has great utility for the development and pilot testing of new standardized assessment forms and behavioral instruments. Researchers can follow standard psychometric procedures and examine different forms of validity, including concurrent and factorial (using existing data), predictive (with prospective data), and convergent and discriminant (with other PDE data assets).

Finally, the PDE is used to perform large-scale program evaluation on a range of DoD-related military programs. For example, there have been calls in the literature for more rigorous evaluation of the Army's Comprehensive Soldier & Family Fitness (CSF2) program—a psychological health and resilience training program.[7,8] The PDE has made it possible to securely bring together data on a range of soldier outcomes, begin evaluating the CSF2 Master Resilience Training (MRT) program, and respond to these clarion calls with evidence-based findings. Specifically, researchers have examined longitudinally participation in the MRT program and subsequent ratings of psychosocial strengths and assets.[9] Follow-up work examined associations between participation in the MRT program and its effect on the prevalence of diagnoses for mental

health or substance abuse problems.[10] Subsequent research will extend to other outcomes, including health ratings, job performance, and healthcare costs, to name a few. The PDE has also been used to evaluate other Army programs, including the Army Surgeon General's Performance Triad—a program designed to promote healthy sleep, physical activity, and nutrition behaviors in soldiers. For researchers in the PDE evaluating military programs using observational studies or quasi-experimental designs, use of the propensity score method (which assesses the likelihood of being assigned to the treatment group based solely on one's demographic or covariate information) strengthens the ability to make causal inferences even in the absence of a randomized control group.[11]

Compliance with Human Subjects' Protections

Extensive measures are taken to protect the confidentiality and personal identity of soldiers whose information is part of the digitized resources housed in the PDE. As part of protecting personally identifying information (PII), social security numbers undergo a two-step transformation and encoding process, which results in the assignment of a random 12-character alphanumeric "key" to each soldier. Data in the PDE can then be merged and linked via the randomly generated "keys" in order to create linked files from multiple databases and time points in support of Army- and DoD-approved research. The governance process that creates identification keys relies on physically and logically separate computer systems with secure Army and DoD firewalls using a VPN connection. In addition, personnel responsible for the extraction, transfer, and load of de-identified data are federally approved contractors who undergo extensive Health Insurance Portability and Accountability Act (HIPAA) training and also work in a secure environment.

Additional transformations for limited data sets containing protected health information (PHI) include truncating birth dates so that only year or month and year are available. A soldier's unit identification code, rank, and pay grade are also transformed for PDE research studies. As outlined below, each transformation of PII is designed to reduce the risk of a soldier being re-identified by a researcher, while maintaining enough information for standard aggregate statistical analysis and longitudinal record linkage.

Accessing Medical and Health Data

Access to medical and health data is covered under the HIPAA (45 CFR Subpart 46, PL 104-191) and the

Privacy Act of 1974 (Pub. L. No. 93-579, and its subsequent amendments USC Sec. 552a, Title 5, Part I, Chapter 5, Subchapter II). Both statutes carefully delineate the safeguarding of PHI and the manner in which "limited data set" identifiers can be disclosed (e.g., birthdates are transformed to MMYYYY).

All preparation of personal health and medical data in the PDE must comport with the Standards of De-Identification of Protected Health Information (Section 164.514[b][2] of the 1974 Privacy Act). The latter requirement involves establishing compliance with either the safe harbor or the expert determination method. Both methods ensure compliance with federal standards that essentially mitigate privacy risks pertaining to sharing PHI between covered entities (i.e., health insurers) and outside parties. The former procedure requires removal of 18 limited data set identifiers (e.g., name, address, e-mail, driver license, or other unique identifiers) from PHI in order to reduce the potential of "re-identification." The latter method relies on scientifically valid statistical audit procedures designed to evaluate the potential risk for re-identification (disclosure) given the proposed de-identification procedures.

Projects deemed research involving human subjects must also undergo an external scientific review using an Institutional Review Board and vetting by the AHRPO, which provides regulatory oversight for human subjects' protection of soldiers. All of these assurances and regulatory requirements are detailed in DoD Information (3216.02 "Protection of Human Subjects and Adherence to Ethical Standards in DoD-Supported Research") and Department of the Army (e.g., AR 70-25 "Use of Volunteers as Subjects of Research") guidelines. Applications for AHRPO human subjects and regulatory approval rely on the Force Health Protection and Readiness IRBNet portal, which is part of the Defense Medical Research Network. The Medical Research and Materiel Command website provides documentation of the Army procedures and applicable DoD regulatory requirements for human subjects' protection.

Conclusions

The RWJF military–civilian collaboration paves the way to methodically and incrementally open the PDE access aperture over time, thereby melding the enormous data assets of the Army with top research scientists from private commercial ventures and university-based settings. This scale-up requires blending the needs of researchers with the operational features of the PDE, all

the while ensuring the protection and confidentiality of personal and health information obtained from the individuals tasked with defending our country. The PDE offers an unprecedented resource to the scientific community, and it is quickly becoming the most extensive collection of digitized information on this important population or any other population we know of, given its tremendous breadth and depth.

In addition, the PDE is also moving in the direction of creating metadata resources to document the various DoD and Army data assets. This will include archived institutional history that describes the evolution of soldier assessment forms, version and content changes in surveys, data management concerns (e.g., variable coding and transformation), and details on data collection methods and parameters describing test administration. Future SharePoint capabilities will enable members of the PDE research community to record comments on data assets and their elements (e.g., indicate whether data fields are incomplete or have different values than expected). This information will prove quite valuable to subsequent researchers and will help build a more efficient "commons" research process. The PDE can also draw upon resources provided by a DoD Metadata Registry, managed by the Defense Information Systems Agency, a web-based repository that promotes interoperability and reuse of computer technology (e.g., data models, symbologies, transformations, and schemas) among military department and defense agencies.

What the Future Holds

Given its relatively recent inception, the PDE has yet to reach full operational capability. Rapid growth of the PDE requiring greater bandwidth, procurement of sufficient "seat" licenses for commercial statistical packages, and the computing power required to manage and analyze large complex data structures currently limit the number of users the PDE can host. Resolving these bandwidth and related operational limitations will be part of getting the PDE to full operational capability. There is also an effort underway to "automate" much of the governance of the PDE, including security procedures for vetting end users, conducting background checks, and ensuring that study research goals are compliant with data use agreements. Every study in the PDE has to maintain current documentation of individual researchers' human subjects' protections compliance, adherence to PDE governance, and DoD Information Assurance certification. As essential as this process is for operational logistics, it can also

be cumbersome. In addition, data assets are not released unless checked manually to ensure release comports with Army Data Use Agreements and, in the case of medical data, meets the requirements specified in Data Sharing Agreements. This process is crucial to maintaining soldier confidentiality as well as regulatory compliance. Furthermore, the Army is also undergoing rapid changes in the types of platforms used to gather soldier data. As an example, a new online platform "ArmyFit" is now gathering data on soldier (and spouse) fitness, including nutritional information, sleep, and physical exercise. This is part of the Army Resilience Directorate's mandate to include emotional, social, spiritual, family, and physical fitness dimensions as part of routine assessments of soldier functioning. The advent of new web-accessible platforms collecting routine information on almost 50,000 soldiers each month means new soldier data (with unique coding formats) are constantly streaming into the PDE, broadening the capability of researchers to track emerging epidemiological trends.

We specifically note that the military–civilian collaboration will reap untold opportunities for researchers, who will gain access to unique and very extensive, prospective data on a very large population of Army soldiers. This will enable them to examine population-based trends in a wide range of health-related behaviors and conditions with important implications for society at large. Likewise, the Army will benefit from the expertise of leading behavioral and medical scientists interested in measuring and improving soldier performance and health, with insights of great potential value for population health more generally.

Author Disclosure Statement

The authors had no conflicts of interest with respect to the authorship or the publication of this article. The University of Pennsylvania has a proprietary interest in the Master Resilience Training (MRT) program. Loryana L. Vie, Lawrence M. Scheier, Tiffany E. Ho, and Martin E.P. Seligman did not analyze MRT data in the PDE or take part in discussions of intervention data related to the MRT program. Paul B. Lester is the Federal Government Sponsor for research activities in the PDE. He provides governance oversight as well as technical assistance obtaining various U.S. Army data assets, including the GAT data from the ArmyFit platform. The views expressed in this article are those of the authors and do not reflect the official policy or position of the Department of the Army, Department of Defense, or the U.S. government.

Appendix I: Case Study

Below we present one example of how Person-Event Data Environment (PDE) data can be used to generate a "report card" on several major cost drivers for the military as well as the U.S. civilian population. In this project, researchers from the Robert Wood Johnson Foundation military–civilian collaboration contrasted five metrics obtained from Active Duty and Reserve/National Guard soldiers with data from the 2012 National Health and Nutrition Examination Survey (NHANES).[A1] The NHANES is one of several nationally representative general population studies that provide valid and reliable measures of health and psychosocial functioning in the United States, and it represents the largest ongoing individual-level health examination survey (other examples include the Behavioral Risk Factor Surveillance System[A2] or the Midlife in the United States Study[A3]).

The five metrics selected for illustration are heavy cigarette use (transforming number of cigarettes in the past 30 days into the equivalent of a pack or more: "21 or more cigarettes per day"); heavy alcohol consumption (three AUDIT-C[A4] items assessing alcohol frequency ["How often did you have a drink with alcohol?"], intensity ["How many drinks did you have on a typical day when you were drinking?"] and binge drinking ["How often did you have 6 or more drinks on one occasion?"]); depression (using the 9-item PHQ-9,[A5] a general population depression screener assessing depressed mood or irritability, decreased interest or pleasure, significant weight change or change in appetite, change in sleep, change in activity, fatigue or loss of energy, feelings of guilt or worthlessness, diminished concentration, and suicidal tendencies); physician care (seeing a medical practitioner over the past year); and hospitalization (whether the respondent had been hospitalized within the past year or, for soldiers, since their last annual Army physical).

Table A1 shows the demographic comparison between the Army and civilian samples. The sample size in the

[a]Army Reserve and National Guard soldiers differ only in the source of their pay. (The National Guard receives pay compensation from the federal budget, but they are organized and run by the individual states. Army Reservists receive compensation directly from the federal budget.) Otherwise their standards of performance and required training programs are identical and both service branches can deploy if needed. Therefore, for the purpose of this article, these two groups were combined.
[b]Civilians are composed of a nationally representative sample from the NHANES (2011–2012).

*Means are adjusted for all variables in the table. Means and period prevalence rates are weighted for NHANES complex sampling design and nonresponse. Comparisons were conducted using ANCOVA and logistic regression with linear combinations.

[†]Heavy cigarette smoking was assessed for those who currently smoke and is characterized by smoking at least 21 cigarettes a day.

[††]Soldiers were asked if they had seen a healthcare provider since their last military examination. Participants in NHANES were asked if they had seen a healthcare provider in the last year.

[‡]Soldiers were asked if they had been hospitalized or had surgery since their last military examination (55% had conducted their prior periodic health assessment within a 15-month window, 30% between up to 2 years, 13% between 2 and 3 years, and 2% beyond this window). Participants in NHANES were asked if they had been a patient in a hospital overnight in the past year.

[a,b,c,d]Raised superscript letters that are different indicate statistically significant differences ($p < 0.05$) of adjusted and weighted means. Same letters indicate no statistically significant differences in means. Tukey's honest significance test method was used to adjust for multiple comparisons and the increased probability of making false-positive type I errors.

AD, Active Duty soldiers; Civ., Civilian (NHANES); HSD, high school diploma; NHANES, National Health and Nutrition Examination Survey; Res./NG, Reserve and National Guard soldiers; Sep./Div./Widow, Separated/Divorced/Widowed.

Table A3. Multinomial logistic regression predicting group membership from demographic and health metrics

Metric	Active Duty vs. civilian[a]		Reserve/National Guard vs. civilian		Overall likelihood-ratio test[b]
	OR	CI	OR	CI	p
Age	0.918	(0.918–0.918)	0.948	(0.948–0.948)	<0.0001
Gender[c]	5.475	(5.412–5.539)	3.302	(3.273–3.331)	<0.0001
Race[c]	1.722	(1.708–1.737)	2.521	(2.504–2.539)	<0.0001
Education[c]	0.223	(0.221–0.225)	0.199	(0.198–0.201)	<0.0001
Marital status[c]	2.222	(2.203–2.242)	0.898	(0.891–0.904)	<0.0001
Cigarette use[d]	0.840	(0.835–0.844)	0.825	(0.821–0.829)	<0.0001
Heavy alcohol consumption	0.808	(0.807–0.810)	0.818	(0.817–0.819)	<0.0001
Depression severity	0.824	(0.822–0.826)	0.747	(0.745–0.749)	<0.0001
Seen healthcare provider[c]	0.228	(0.226–0.230)	0.175	(0.174–0.176)	<0.0001
Hospitalized[c]	4.768	(4.709–4.827)	3.150	(3.114–3.186)	<0.0001

[a]The multinomial regression simultaneously tests two logit models comparing one of the three groups against the reference category, which is the Civilian-NHANES group.
[b]The overall-likelihood test is analogous to testing whether or not all two separate ORs are significantly different from an OR of 1.0, which shows that the predictor does not efficiently discriminate group membership.
[c]Reference categories: female; non-white; high school diploma or less; non-married; did not see healthcare provider; not hospitalized.
[d]Variable transformed for this analysis to include nonsmokers (0=0 cigarettes/day, 1=≤10, 2=11–20, 3=21–30, 4=31+).
OR, odds ratio; CI, 95% confidence interval.

PDE is more than 100 times that of NHANES, most conspicuously so for race-ethnic groups other than white. The military population is younger, less highly educated, and more often married than the NHANES population sample. Notably, the Active Duty and Reserve/National Guard Soldier populations are generally quite similar demographically, supporting their potential pooling for many research purposes. Table A2 contains the results of group mean comparisons for the five metrics outlined above. A careful inspection shows that, adjusted for all other covariates in the model, soldiers consistently reported higher rates of heavy cigarette smoking compared to civilians, and this pattern held for gender, race, education, and marital status subgroups. Civilians reported heavier alcohol consumption, and this pattern held with few exceptions across the different subgroups (Asian and other race groups were not different). Up through age 40–49, higher rates of depression were reported by the civilian population. This pattern held across most of the demographic subgroups with the exception of less educated civilians who reported fewer symptoms. Active Duty and Reserve/National Guard soldiers were less likely to have visited a healthcare provider during the study period compared to civilians; Active Duty and Reserve/National Guard soldiers were more likely to have had surgery or been hospitalized in the last year compared to civilians; the latter may reflect the occupational risks experienced by this group.

Table A3 contains odds ratios and confidence intervals obtained from a multinomial logistic regression model. This model provides information on the relative effi-

ciency of the demographic and health-related predictors to differentiate group membership (reference group is the NHANES civilian population). Odds ratios less than 1.0 indicate higher likelihood of being a member of the civilian population. These results, adjusted for the other health behaviors and demographics, show a fairly consistent pattern reinforcing the lower rates of heavy alcohol consumption, depressive symptoms, and utilization of healthcare providers, and the much higher rates of being hospitalized among all soldiers compared to civilians. Overall, this illustration demonstrates the applicability of the PDE to questions of population health important for both the military and civilians. Analysis of epidemiologic patterns within the military can clearly inform health issues, such as those shown, for military health policy. Findings from studies of military samples can have tremendous bearing on the knowledge of civilian health, particularly when variable definitions are closely aligned and variables can be compared directly.

Employer Data Matching Workgroup White Paper

January 2017

CONTENTS

EXECUTIVE SUMMARY[1]

Matching and reusing data on employers across Federal government agencies can have multiple and significant benefits, but it is currently very difficult to do. In order to begin to address these issues, OMB convened an interagency Employer Data Matching Workgroup. The Workgroup was co-chaired by senior members of the Census Bureau and the Bureau of Labor Statistics, and included over 40 expert Federal staff across 14 Agencies, representing 29 program, evaluation, or statistical offices. The scope of this project included examining current and potential future methods of matching data at multiple levels (establishment, and firm or enterprise), matching parent/child relationships within firms or enterprises, and capturing the dynamic nature of these relationships as they change over time. Key tasks included:

- Documenting issues Federal agencies face related to matching and uniquely identifying establishments and firms within and between data sets and over time;
- Identifying current successful strategies and/or policies used by Federal agencies to address matching challenges in the context of analyzing data, conducting evaluations, producing statistics, and identifying where additional strategies may be needed to further facilitate this work; and
- Summarizing potential future steps Federal agencies can take to improve the Federal government's ability to identify and match unique firms and establishments (and the relationship between the two) within and across Federal data sets, for the purposes of analyzing data, conducting evaluations, and producing statistics.

Matching Employer Data

Many Federal administrative and statistical activities require a matching process. In general, matching activities fall into one of the following fundamental types of activities:

- **Finding data on the same entity within a single data set:** agencies are de-duplicating and aggregating data, within the same business level (for example, at the establishment or enterprise level) and within the same data set, to find all observations related to a single legal entity.
- **Aggregating data within a corporate structure**: agencies aggregate data to the enterprise level of a corporate structure in order to group all observations related to a single enterprise.
- **Matching microdata at the same business level** between two or more data sets for:
  - Statistical purposes (including program evaluation): For example, agencies add variables to existing data sets to enhance quantitative analyses of firm behavior.
  - Programmatic purposes: For example, agencies may use linked data sets to support decision making from merged data that better defines market activity, and resulting risks.
- **Matching between different business levels** in two or more data sets: for example, agencies link different business levels to more fully understand corporate structures in the context of successorship, franchising, and multisite employers, at a given point or over a period of time.

Types of matches

There are two types of matching: deterministic and probabilistic:

- **Deterministic**, or exact, matching, looks for an exact match between two pieces of data.

---

[1] This white paper is intended to provide the Commission on Evidence-Based Policymaking with background information on topics relevant to the Commission's work. The paper was prepared by staff from OMB and staff from other Federal agencies.

- **Probabilistic**, or "fuzzy," matching uses a statistical approach to assess the probability that two records represent the same entity.

Data quality is a key factor in determining which method to use for matching. If data are well-curated, deterministic matching is the simpler, more accurate, and faster method, when the two data sets contain the same unique identifiers to perform the match. Often, such identifiers are not available, or the identifiers present within the data sources do not uniquely identify the entities to be matched. In such cases, deterministic matching may still be possible, but only with painstaking research for each case. Probabilistic matching is more complex than deterministic matching, but it provides an approach for matching when deterministic matching is not feasible. It is often difficult and resource-intensive to evaluate the quality of probabilistic matches.

Challenges in matching employer data

There are two primary issues that drive the vast majority of the challenges in matching data: the lack of a common universal identifier for employer units and poor quality of the underlying identifying data.

The greatest barrier to matching data on employers across data sets is the lack of a common, or universal, business identifier. Eliminating this obstacle by developing a Federal system to create and manage a universal identifier could result in cost savings in matching but would require a major investment of time and Federal resources to create and maintain such an infrastructure. Assuming that the identifier could be created, it would be a challenge to enforce consistent use of such an identifier by all employers on the domestic and international fronts. This identifier would need to capture various corporate/industry levels and change over time (in other words, it should change with firm births, deaths, mergers, acquisitions, etc.), and no Federal entity has the authority, staff, or resources to collect and manage such information.

There are examples of voluntary, widespread adoption of important taxonomies, such as the North American Industry Classification System (NAICS). Given that the creation and use of a universal identifier is likely in the best interest of taxpayers and will likely reduce Federal and enterprise burden, it would be worth exploring whether a voluntary means of adoption is viable. Such voluntary adoption may also be complicated by the nature of the global economy and the domestic and international structure of some employers.

Because there is no universal employer identifier which meets cross-agency needs, agencies often have to expend significant resources to research each case for deterministic matching or to obtain data for probabilistic matching. That is, agencies can and do combine different data fields to match employer data, but the effectiveness of this approach varies based on data fields available and data quality in those fields. Common issues include: missing important data fields, inconsistent data formats, and change over time in critical matching fields.

Best Practices

There is substantial potential to achieve efficiencies in matching U.S. employer data across Federal data sets for data analysis, evaluations, and statistical activities, based on common needs across agencies. To this end, there are immediate steps agencies can take to adopt best practices for data collection and matching, which are illustrative of the nature of practices Federal agencies have developed to deal with difficult, entrenched matching challenges. There are also ways to maximize the use of existing authorities and data sets to enable matching. In particular, leveraging data elements common among Federal agencies which, in combination, constitute a universal unique identifier, would facilitate efficiencies for matching Federal data sources.

Notably, the utility of Federal data sources can be increased by including as many cross-agency identifiers as possible. While these fields are useful for matching, it is important to note that identifiers have confidentiality, privacy, and proprietary concerns.

Moving forward, there are topics that could benefit from further investigation from the Employer Data Matching Workgroup, such as the development of a roadmap for implementing common data elements in Federal data sources, the development of an authoritative source of business existence and characteristics for Federal agencies, the possible role and value of a centralized data sharing "referee," and the establishment of a Federal community of practice for matching and entity resolution.

INTRODUCTION

The Federal Government currently collects data from employers and enterprises in the United States for a wide range of purposes, including administering small business loan programs, administering regulatory requirements, and producing valuable economic statistics. While these data collections are valuable and frequently necessary, in some cases they can result in the collection of duplicative information from employers. For example, both the Bureau of Labor Statistics and Census Bureau collect duplicative information on businesses with multiple locations.[2]

Several agencies have taken steps to attempt to reduce this burden while also increasing the amount and usefulness of the information generated from these data collections.[3] For example, since the 1990's, agencies within the Federal Statistical System have taken advantage of electronic data and web-based reporting to minimize respondent burden and significantly lower data processing costs.[4] Additionally, the Environmental Protection Agency (EPA) implemented an Application Programming Interface (API) that allows regulated establishments and facilities to take advantage of previously-reported information for querying, retrieving and pre-populating future required reports, which not only improved the data quality and the ability to match data across multiple programs, but also reduced the annual reporting burden by over 140,000 hours for a single EPA program.[5]

---

[2] The BLS conducts its quarterly Multiple Worksite Report (MWR), which asks most multi-location employers to provide monthly employment and quarterly wage data for all of their establishments covered under one Unemployment Insurance (UI) account in a state. Most multi-location employers with a total of 10 or more employees combined in their secondary locations are required or requested to complete the MWR. The Multiple Worksite Report is designed to collect information showing the distribution of the monthly employment and quarterly wages of business establishments, by industry and geographic area. Information on the MWR form is used to more accurately classify employment and wage data of multiple establishment employers by industry and by location within a State. By collecting and storing employment and wage data by worksite, states and the BLS can disaggregate these data below the county level for more extensive and detailed analysis of business and economic conditions within their state, including local and regional employment totals. These data are used to ensure an equitable distribution of federal funds through grant programs that use county economic indicators as a basis for allocations. No other sources are available to obtain this information.

The Census Bureau conducts its annual Company Organization Survey (COS) to obtain similar information on multi-establishment firms in order to maintain its Business Register (BR). Annual data collection for the COS begins in late December of the reference year for the pay period of March 12th. Reported data are for activities taking place during the reference year. An annual mail-out survey of selected companies is conducted for large multi-establishment companies with 500 or more employees are selected with certainty. Small multi-establishment and single-establishment companies are selected based on administrative data indicating a probable organizational change. All selected companies are identified from those maintained on the Business Register. Survey results are available to the Census Bureau about 8 months after each reference year and are used throughout Census Bureau economic data program operations, as a major source of information for County Business Patterns reports, and as a resource in responding to requests for a variety of special reports and reimbursable tabulations.

Recently, BLS and Census have been sharing their multi-unit data which accrues cost efficiencies and improves the comparability and accuracy of Federal economic statistics by improving the consistency of multi-location data and reducing respondent burden.

[3] The examples noted represent the current range of burden reduction activities occurring among Federal agencies. By achieving efficiencies in matching through the white paper's suggested approaches, future burden reduction is possible (e.g. avoiding new surveys).

[4] For example, see:
https://www.census.gov/history/www/innovations/data_collection/counting_the_population.html
http://stats.bls.gov/opub/mlr/2016/article/one-hundred-years-of-current-employment-statistics-data-collection.htm
[5] EPA Toxic Release Inventory TRI-MEWeb 2.0 Reporting Burden Estimate

At the same time, there is a growing interest in identifying more efficient and effective ways to help employers succeed and comply with Federal requirements. One cost-effective method to generate these insights is by analyzing and evaluating the effectiveness of existing programs using the data that government already collects. Frequently the programs that are being evaluated are designed to help firms grow, ease compliance with Federal requirements, or promote innovation. However, the data on the outcomes of interest, whether it is employment growth, regulatory compliance, economic growth, or competitiveness, frequently reside in different government data sets, across multiple agencies. To capture this outcome information, agencies can either collect the information again—at additional cost and burden on employers, or they can get the data from a data set elsewhere in government.

Similarly, statistical agencies may be able to more cost-effectively and efficiently collect and generate economic statistics by re-using already-collected data. Using such data, statistical agencies can establish sampling frames which are more cost-effective by accounting for additional information on the sampling units. Additionally, improvements in administrative data can reduce burden associated with statistical collection by reducing the need for duplicate reporting of information. If statistical agencies can gain access to key data via the administrative data that employers already report as a regular part of their business activities, there will be less need for the statistical agencies to ask employers for those data again through surveys. Further, combining these data can lead to new, improved, and valuable data products and evidence that can benefit employers and help government develop smarter policies[6].

It is currently very difficult for agencies to access and use this information for statistical, evaluation, or other purposes[7]. In order for these data to be useful, researchers, statisticians, and evaluators must be able to match data on individual employers within the same data set and between different data sets, and they must be able to do so reliably and with little error. Access to the data may also be limited by law, such as by Title 26 or the Confidential Information Protection and Statistical Efficiency Act of 2002 (CIPSEA). This type of matching requires the ability to accurately identify the same employer in two or more different data sets. When conducting this type of match for individuals, frequently a combination of unique identifiers is used, including the social security number (SSN), name, and date of birth (DOB). However, for employers, there is no standard equivalent to SSN, name, and DOB. In some cases this variation in employer identification approach is the byproduct of different program rules and requirements. In other cases it is an artifact of the way government data systems have developed over time. In all cases, this variation is a large barrier to determining if Federal programs and policies affecting employers and their employees are effective, especially when answering such questions requires data from multiple data sets. Just a few of the complicating factors involved include:

- Lack of a unique identifier. There is no government-wide policy on which, or even whether, any unique identifier should be used across all government data sets that affect employers. Data sets may include different identifiers for legal, policy, or programmatic reasons, such as to maintain consistency with historical data or to minimize burden on respondents.
- Inconsistent level of identification. Businesses have multiple levels of organization, including the establishment (physical location), enterprise (which may consist of multiple establishments), and parent company (which may consist of multiple enterprises). There may also be differing needs for ultimate domestic corporate parent versus global corporate parent. Depending on the purpose of a program or statistical collection, Federal agencies track employer information at different levels of identification, and matching across these levels can be difficult.

[7] See also: "Barriers to Using Administrative Data for Evidence-Building." July 15, 2016.
https://www.whitehouse.gov/sites/default/files/omb/mgmt-gpra/barriers_to_using_administrative_data_for_evidence_building.pdf

- Data quality. Data quality issues, such as respondent reporting error, or lack of formatting consistency among fields for matching, prevents or complicates the matching processes.
- Timing. The timing for when the data are collected may complicate the matching process as more current information may be available for the same unit of observation.

For all of these reasons, it is often highly labor intensive and expensive to match and reuse these data. Matching across data sets can take months or even years, and still may not fully serve the intended goals. These problems occur across statistical, evaluation, and program functions in Federal agencies. While the purpose of matching may differ, the matching and analytical challenges are common across these functions.

Overview of the Workgroup

In order to begin to address these issues, OMB convened an interagency Employer Data Matching Workgroup. The Workgroup was co-chaired by senior members of the Census Bureau and the Bureau of Labor Statistics, and included over 40 expert Federal staff across 14 Agencies, representing 29 program, evaluation, and statistical offices. The scope of this project included matching at multiple levels (establishment, and firm or enterprise), matching parent/child relationships within firms or enterprises, and capturing the dynamic nature of these relationships as they change over time.[8]

The Workgroup was charged with developing strategies to make it easier to match data on U.S. employers across Federal data sets for statistical purposes. **Statistical purposes** refer to the use of data to better understand the characteristics, behavior, or needs of groups.[9] Program evaluation falls within this definition. Statistical purposes exclude uses of data that affect the rights, benefits, or privileges of individual entities: indeed one of the defining characteristics of statistical uses is that data about an individual entity are never made public and are never used to make decisions about that entity. But statistical purposes include a wide range of analytic uses, where only aggregated and de-identified data are made public.

While the Workgroup focused its activities on these statistical purposes, it became clear that many of the best practices identified could have benefits for non-statistical purposes. One of the primary ways this work could reduce burden on employers is by facilitating the re-use of individual-level employer identifying data from one program to another (e.g., by allowing an employer to select itself from a pre-populated list or auto-loaded list of establishments or entities rather than entering the data anew each time). This type of activity requires identification and release of information at the individual identity level, so even though the information may be otherwise publicly available (e.g., name and street address), it falls outside of the definition of a statistical purpose.

Workgroup members have spent many years finding ways to improve matching for their specific purposes. The goal of this white paper is to share knowledge and best practices the Workgroup believes would yield potentially significant benefits in reducing agency workloads, burden associated with statistical collection, and reporting burden for employers.

---

[8] See Appendix D for a detailed description of participating Federal agencies and the Workgroup methodology.

[9] Note that a statutory definition of "statistical purpose" exists in section 502(9) of CIPSEA:

"The term 'statistical purpose'-

"(A) means the description, estimation, or analysis of the characteristics of groups, without identifying the individuals or organizations that comprise such groups; and

"(B) includes the development, implementation, or maintenance of methods, technical or administrative procedures, or information resources that support the purposes described in subparagraph (A)."

WHAT IS AN "EMPLOYER?"

In order to identify the barriers and potential best practices for matching and reusing data on employers, it is first essential to identify what we mean by "employer." This task is somewhat more complicated for businesses than for individuals, given that the identification of a person is fairly stable regardless of context. However, there are multiple levels of business that may be of interest. For example, one could be interested in the effect of a technical assistance grant on a single business location, or the effect of a small business loan on a firm that has multiple locations.

Terms such as "employer," "firm," or "establishment" are often defined differently in statutes and regulations across Federal agencies and programs. Many of these terms are based on commonly shared concepts, so while precise matching of terms across agencies is not possible, some generalization is both useful and practical. For clarity, this white paper uses an internal taxonomy to account for the definitional differences among Federal agencies:

- **Establishment:** a single physical workplace or facility. An establishment is commonly understood as a single economic unit, such as a farm, a mine, a factory, or a store, that produces goods or services, for which payroll and employment records are kept. Establishments are typically at one physical location and engaged in one, or predominantly one, type of economic activity for which a single industrial classification may be applied.[10]
- **Legal Entity:** a legal person or structure that is organized under the laws of any jurisdiction.[11]
- **Enterprise:** Alternative terms for enterprise are *firm* and *company*. An enterprise is a legal business entity that may consist of one or more establishments. Each establishment may or may not participate in a different economic activity. The establishments may have different physical addresses. If they do, the physical address of record should be for the headquarters or main office of the enterprise.[12]
- **Parent Company:** An enterprise that owns all or the majority (51% +) of another enterprise so that the latter stands in relation to the former as a subsidiary.[13]
- **Employer**: a legal entity or individual identified as a worker's employer either nominally (for example, on the workers' paychecks or tax forms) or through an employment relationship. This term can pertain to establishments, enterprises, and parent companies.[14]

Federal data sources and related matching efforts often capture relationships among establishments, enterprises, and parent companies, for mission-related analysis and reporting. For example, an establishment-based enforcement program might collect all of their data at the establishment level, but in order to analyze trends by enterprise or industry, need to be able to aggregate those data. As another example, a statistical agency may collect data at the establishment level, but publish tabulations of these data by the size of the parent company.

---

[10] Portions of this definition are derived from the definition of "establishment" within the Bureau of Labor Statistics' Quarterly Census of Employment and Wages (QCEW) Business Register (BR), and the Census Bureau's Business Register.
[11] This definition is derived from the International Organization for Standardization's definition of Legal Entity Identifier. For further information, see: http://www.iso.org/iso/catalogue_detail?csnumber=59771
[12] Portions of this definition are derived from the definition of "firm" or "company" within the Bureau of Labor Statistics' Quarterly Census of Employment and Wages (QCEW) Business Register (BR), and the Census Bureau's Business Register's definition of "enterprise."

MATCHING EMPLOYER DATA

Why is matching conducted?

Many Federal administrative and statistical activities require a matching process. For example, if an agency wants to avoid having duplicate observations for an establishment within an administrative database, then it has to identify all reports in its data that apply to a specific establishment, and then look to see if there are duplicates for certain phenomena. In general, matching activities fall into one of the following fundamental types of activities:

- **Finding data on the same entity within a single data set:** agencies are de-duplicating and aggregating data, within the same business level (for example, at the establishment or enterprise level) and within the same data set, to find all observations related to a single legal entity. For example, agencies regularly undertake projects, involving searches within administrative data sources, to identify all instances of transactions with particular legal entities. A regulatory agency may search its administrative data to determine the compliance history of a particular employer.
- **Aggregating data within a corporate structure**: agencies aggregate data to the enterprise level of a corporate structure in order to group all observations related to a single enterprise. For example, agencies will nest companies within larger, related aggregates in order to measure economic activity over time. Statistical agencies may aggregate data (e.g. employment counts) for branch locations of an enterprise, in order to measure the size of the enterprise.
- **Linking/Matching microdata at the same business level** between two or more data sets for:
  - Statistical purposes (including program evaluation): For example, agencies add variables to existing data sets to enhance quantitative analyses of firm behavior. A statistical agency may integrate data sources to augment one source with fields not initially contained within the source, such as firm age.[15]
  - Programmatic purposes: For example, agencies may merge data sets to provide fuller information on market activity and risks to support decision making. A regulatory agency may take advantage of merged employer data sources to get a more complete picture of firms and sources of financial risks in an industry.
- **Linking/matching between different business levels** in two or more data sets: for example, agencies link different business levels to more fully understand corporate structures in the context of successorship, franchising, and multisite employers, at a given point or over a period of time. An agency may match data on corporate hierarchies with another employer data set, to further understand the employer's relationships with other legal entities. Also, an agency may tabulate data collected at the establishment level by characteristics of parent companies.

---

[15] Additionally, statistical agencies link microdata at the same business level to develop new data products. For example, BLS's QCEW program matched publicly available IRS data on nonprofits with its business register to develop new data on the non-profit sector. This initiative is meeting the needs of data users with no new resources while imposing no new respondent burden on businesses. These new combined research data covering 2007–2012 were released in September 2014, meeting a longstanding need for recent, detailed industry and geographic detail on this large sector of the economy. The nonprofit sector covers about 10% of employment and has higher than average wages, making this segment of the economy important to understand. Another BLS matching project overlays hurricane flood zones over geocoded business locations. Maps and tables are published and available on the BLS website showing the number of establishments, and the accompanying employment and wages that are exposed to potential damage under hurricane conditions of varying strengths.

Types of matches

There are two types of matching: deterministic and probabilistic:

- **Deterministic**, or exact, matching, looks for an exact match between two pieces of data. In order for this method to be effective, the data being matched should uniquely identify the entity of interest, and the same data field should be present and formatted in the same way in both records. This method is ideal if the data sets of interest are reliably and accurately collecting unique identifiers, and the unique identifiers are well-matched to the purpose of the analysis.
- **Probabilistic** matching uses a statistical approach to assess the probability that two records represent the same entity. In order to accomplish this, a set of data fields are compared between two records and the closeness of the match between two record pairs is assessed.

Data quality is a key factor in determining which method to use for matching. If data are well-curated, deterministic matching is the simpler, more accurate, and faster method, when the two data sets contain the same unique identifiers to perform the match.[16] Often, such identifiers are not available, or the identifiers present within the data sources do not uniquely identify the entities to be matched. In such cases, deterministic matching may still be possible, but only with painstaking research for each case. Probabilistic matching is more complex than deterministic matching, but it provides an approach for matching when deterministic matching is not feasible. It is often difficult and resource-intensive to evaluate the quality of probabilistic matches.

Deterministic and probabilistic matching methods have the potential to produce data structures that give additional insights the original data could not have provided. Several agencies and offices reported the use of matching methods to turn administrative data sources, with multiple discrete observations of employers or establishments, into quasi-longitudinal or time series data, by linking observations over time. Similarly, there are matching applications that can link subsidiaries to parents or nest companies within larger, related aggregates.

Current unique identifiers used across Federal Agencies

Several entities have created unique identifiers (IDs) in order to improve matching and identification of employers, which are used across multiple Federal Agencies. However, none of these IDs are universally collected, and none of them uniformly identify the level of business or the relationship between the levels of business. There are four primary unique identifiers currently in use by Federal Agencies: the Employer Identification Number (EIN), Data Universal Numbering System (DUNS©) numbers, Commercial and Government Entity (CAGE) codes, and the Legal Entity Identifier (LEI). To apply for a Federal contract or grant, an entity must have an EIN, DUNS© number, and CAGE code. However, these identifiers are not currently used throughout all Federal data sets as only a small percentage of U.S. enterprises register annually for Federal contracts or grants. These identifiers enable clear identification of unique entities seeking Federal dollars and are used to identify exclusions, past performance history, and business integrity. Additionally, the LEI, as required under Public Law 111-203 (commonly known as the Dodd-Frank Wall Street Reform and Consumer Protection Act), is heavily used within the federal financial regulatory community, and by non-financial regulatory agencies.[17]

---

[16] See also: https://www.healthit.gov/archive/archive_files/FACA%20Hearings/2010/2010-12-09%20Patient%20Linking/Probabilistic%20Versus%20Deterministic%20Data%20Matching.pdf

[17] For a complete list of Federal agencies currently using LEI, see: https://www.gleif.org/en/about-lei/regulatory-use-of-the-lei.

- The **Employer Identification Number (EIN)** is issued by the IRS. Under the Internal Revenue Code (IRC), every US entity is required to have an EIN for tax purposes regardless of whether they have Federal contracts or grants. An enterprise subject to Federal income tax will file using this EIN on its own separate tax return or file under the Parent Company's EIN of a consolidated return if it elects to file with an affiliated group of other enterprises.[18] Furthermore, establishments can be associated with multiple EINs or an enterprise could use the same EIN for all its establishments.
- A **Data Universal Numbering System (DUNS©)** number is a uniform and unique nine-digit number administered by Dun and Bradstreet (D&B). The number is assigned by D&B and is currently collected by the Federal government as part of the registration process for grants and contracts.
- A **Commercial and Government Entity (CAGE)** code is a uniform and unique five-character alpha-numeric identifier for entities in the U.S. CAGE codes are used internationally as part of the North Atlantic Treaty Organization Codification System (NCS). Management of CAGE codes in the United States is done by the Department of Defense. If an employer has not applied for Federal contracts or grants, the entity would not need a CAGE code and thus may not have one.
- The **Legal Entity Identifier (LEI)** is a 20-digit, alpha-numeric code based on the ISO 17442 standard developed by the International Organization for Standardization (ISO). It connects to key reference information that enables clear and unique identification of legal entities participating in financial transactions, such as those participating in financial transactions or when used in regulatory and supervisory reporting.[19]

There are a number of other intra-Agency identifiers which Federal Agencies use for internal databases, or for limited cross-agency coordination. For example, the **State Unemployment Insurance Account Number** (UI number) is issued by state unemployment insurance agencies. The state identification number is assigned by each state to identify employers covered by State UI laws or to identify federal government installations covered by Unemployment Compensation for Federal Employees (UCFE) provisions. UI account numbers are utilized at the federal level to identify establishments maintained in the BLS's Quarterly Census of Employment and Wages (QCEW) files. This field is consistent from quarter to quarter and allows for identification of the same unit over time.

Challenges in matching employer data

There are two primary issues that drive the vast majority of the challenges in matching data: the lack of a common universal identifier for employer units, and poor quality of the underlying identifying data.

Universal Employer Identifiers

Agencies lack a single, universal identification system for establishments, firms and other types of employer units in Federal and non-Federal data. In the ideal system, such an identifier would be hierarchical such that each employer unit, at each level (i.e., establishment, enterprise, parent company) would have its own unique ID, and the set of identifiers would be used together to identify the relationships among the levels over time.

---

[18] Further, some foreign entities that are US-owned have an EIN for Federal tax purposes.
[19] "Introducing the Legal Entity Identifier (LEI)." Global Legal Entity Identifier Foundation. <https://www.gleif.org/en/about-lei/introducing-the-legal-entity-identifier-lei>. Accessed 12/9/2016. See also: http://www.leiroc.org/lei.htm.

Thus a single establishment could be tracked not only across multiple data sets, but also as it is sold from one enterprise to another.[20]

If such an infrastructure existed, linking would be simple, as deterministic matching with a single data element would be feasible, and connections among different business levels over time would be implicit in the identification system. Developing such an infrastructure could result in cost savings over time for both statistical and program agencies, though more work needs to be done to compare the costs and benefits of developing this infrastructure.[21] Such a system would also enable an employer to provide a piece of data to government only once, rather than multiple times, subject to any legal limitations on sharing of the data. A primary challenge with such a system is maintaining the accuracy and currency of the underlying firm or employer data. While matching would be simple, verifying the mergers, acquisitions, incorporations, and continuous changes would require significant domestic and international resources or connections. Absent such due diligence, employers could change incorporation or legal structure, and obtain new identifiers. Assigning improper activity, sanctions, or other such determinations based on inaccurate identification could have serious repercussions.

There is great variability among statutes, regulations, agency policies, and reporting definitions in how employer units are identified. This variation largely comes from differences in laws and policies as they apply to different subsectors of business. For example, the Fair Labor Standards Act of 1938 (FLSA), which "establishes minimum wage, overtime pay, recordkeeping, and child labor standards affecting full-time and part-time workers in the private sector and in Federal, State, and local governments,"[22] defines "employer" to include "any person acting directly or indirectly in the interest of an employer in relation to an employee and includes a public agency, but does not include any labor organization (other than when acting as an employer) or anyone acting in the capacity of officer or agent of such labor organization."[23] In comparison, the Occupational Safety and Health Act of 1970 (OSH Act), which "assure[s] safe and healthful working conditions for working men and women," defines "employer" to mean "a person engaged in a business affecting commerce who has employees, but does not include the United States (not including the United States Postal Service) or any State or political subdivision of a State."[24]

The statutes have additional differences, such as differences in coverage. A 2002 GAO study noted when comparing the FLSA and OSH Act that: "Coverage under the OSH Act is broader. All employees of a particular employer are covered if the employer is engaged in a business affecting commerce. Coverage under the OSH Act does not depend on the specific activities of the employee or the volume of the employer's business."[25]

This variability has obvious ramifications for what can reasonably be expected from matching data sources from very different programs and approaches to defining "employment," "employer," and "employee," as well as corporate structures such as "firm," "establishment," and "enterprise." [26] Many of these inconsistencies would still present obstacles to matching even if the government were to develop a common conceptual standard and definition for the unique identifiers.

---

[20] More specifically, databases with such a universal unique identifier would ideally contain a history for each establishment of its relationships over time (i.e. its history of hierarchical identifiers). That database would allow for tracking of the establishment over time even if it changed owners and relationships.

[21] Costs could include, for example, staff to research the incorporation or legality of an entity, build corporate family trees, and track changes among corporations. Benefits could include elimination of costs related to poorly matched or unmatched data.

[25] From: http://www.gao.gov/assets/240/235612.pdf

[26] The paper contains an internal taxonomy to ensure that there is a common set of definitions to support its description of best practices.

In addition, considering the variations in statutes, policies, and uses, creation of a new Federal infrastructure that would establish, maintain, and assign identifiers to commercial and Federal entities would require considerable effort. Such a change would require the establishment of a Federal program to manage the identifiers. In addition, such a change could require changes in statute to harmonize definitions of different employer units as well as modifications to policy and numerous data collection and maintenance systems across Federal government agencies. Such changes in program definitions would need to be handled in a manner so as not to disrupt the continuity of longitudinal data that is already being collected. Also, regulatory agencies could not leverage confidential data sources within Federal statistical agencies even if those sources contain a universal identifier.

Beyond cost and conceptual challenges, it would also be difficult to enforce consistent use of such an identifier by all employers within current authorities. There is no single Federal agency that would be a natural owner to enforce the use of such an identifier because no Federal entity currently collects all of this information. There are examples of voluntary, widespread adoption of important taxonomies, such as the North American Industry Classification System, or NAICS. However, this is a very broad standard that is applied to classes of enterprises and employers rather than used to uniquely and uniformly identify individual employers. Given that the creation and use of a universal identifier is in the interest of businesses and taxpayers, it would be worth exploring whether a voluntary means of adoption of a universal identifier is viable.[27]

Moreover, there are ways to maximize the use of existing authorities and data sets to enable matching. In effect, these probabilistic methods rely on a variety of existing, widely collected data fields, which when combined can effectively create a flexible "universal identifier" that can be adapted to different applications. These methods generally require the data to be of high quality and sufficiently standardized in order to be effective.

Because there is no universal employer identifier which meets cross-agency needs, agencies often have to expend significant resources to obtain data for probabilistic matching. Agencies currently deal with challenges related to:[28]

- **Resource and capacity constraints.** Acquiring data housed by other agencies can be costly and difficult for Federal agencies. The process of developing interagency agreements can be time-intensive, and agencies require employees with the proper skill set and time available to reconcile data with different definitions. Also, because many agencies do not have a complete and current data inventory, they may not be fully aware of data that is available to support their particular needs. After receiving the data, agencies may not know the usefulness of the available data until after significant efforts to review the source, depending on the availability of relevant documentation and metadata. Additionally, infrastructure may be a barrier to obtaining data. For example, if the construction of an agency's own or preferred data center is considered sufficient for one survey but not another (e.g., differences in requirements for physical security and data access protocols between two data sources might prohibit linkage), an agency may have to expend significant resources to determine an alternative strategy for accessing data. Lastly, the cost of purchasing external data sources can serve as a practical barrier for agencies with limited funding available for such purchases.

---

[27] A review of voluntary adoption would require the selection or scoping of a prospective identifier. The Workgroup puts forward a framework for Federal data sources to include existing, widely collected data fields, which when combined can effectively create a flexible "universal identifier" that can be adapted to different applications.

13

- **Legal barriers.** While there are Federal data sets containing information that can be valuable to regulatory agencies, limitations on the use of such data frequently restrain access. For example, under CIPSEA, data, including business data, acquired by an agency under a pledge of confidentiality and for exclusively statistical purposes can only be used by officers, employees, or agents of the agency exclusively for statistical purposes. Lacking access to an authoritative source on business existence and structure is a critical issue for correctly matching data, because agencies have no way to know if the data they are collecting is fully accurate. An authoritative source would be useful to serve as a "spine" to match data against.
- **Policy and legal interpretations.** At the agency level, there can be confusion in the interpretation of statutes such as CIPSEA as well as other policies on data sharing, which may create additional barriers for agencies trying to access and share Federal data sources for matching purposes. Agencies may spend months or years coming to agreement on the proper interpretation of a particular statute or policy, and to develop interagency agreements to allow matching. OMB's M-14-06, *Guidance for Providing and Using Administrative Data for Statistical Purposes*[29], encourages Federal departments and agencies to promote the use of administrative data for statistical purposes and provides guidance in addressing legal and policy requirements for such uses. It creates "a presumption in favor of openness to the extent permitted by law and subject to privacy, confidentiality, security, or other valid restrictions."

Data quality

Agencies can and do combine different data fields to match employer data, but the effectiveness of this approach varies based on data fields available and data quality in those fields. These issues can prevent deterministic matching for a number of reasons:

- **Missing important data fields:** Agencies frequently do not collect enough of the most important pieces of data to enable matching, and so they do not engage in data matching for those data sets. Federal agencies have generally built data collections for narrow and specific purposes, designing definitions, content, and formats to suit the immediate needs of the program performing the collection. While most sources with employer data include common data elements such as name, address, and basic characteristics such as NAICS code, these fields are not sufficient to match in all cases. For example, a match can be extremely difficult if not impossible to complete when data in the first data set is at the corporate level, but the matched data set is at the establishment level and does not include fields linking the establishments to their corporate hierarchies, such that neither data set has sufficient fields to create a cross-walk between the two. In some cases, agencies may have sufficient data to match on a deterministic or probabilistic basis, but may not have sufficient supplementary data to assess how good the match is.
- **Inconsistent data formats:** Federal agencies often have to deal with data quality issues arising from inconsistent data format standards. To cite a fairly common example, establishment names can vary considerably within and between data sources. Most data sources collect this information in free-text fields without edit checks, and allow variation. In extreme cases, establishment names can vary considerably, with a single Post Office branch being identified as "USPS", "US Postal Service", "United States Postal Service", and "USPS - MAIN STREET SOUTHBEND." In this case, deterministic matching of data sources by establishment name will not work, and even probabilistic matching methods may not work completely. Also, there is significant variation in data quality due to a lack of internal checks or naming conventions.

---

[29] https://www.whitehouse.gov/sites/default/files/omb/memoranda/2014/m-14-06.pdf

- **Change over time in critical matching fields:** With both deterministic matching and probabilistic matching, a common assumption is that the fields are static over time—that is the field is collecting the same information in year one as it is in year ten. However, there are a number of instances in which this is not the case, where fields are redefined over time. The business universe is dynamic, and issues such as relocation, mergers, successorship, and firm births/deaths produce a mismatch between data collection and changes in business status. For example, this issue arises in analyses of young, small businesses which may not have been in existence long enough to meet annual reporting requirements for collections. Evolving classification systems, such as NAICS and LEI, also present a unique challenge in matching data sources where observations occurred over a period of many years.

BEST PRACTICES

The Workgroup identified a number of practices that agencies could adopt within current authorities that have the potential to reduce burden on employers and agency staff while also facilitating better use of information. The Workgroup prioritized best practices based on the following criteria:

- **Efficiency or Cost-Effectiveness:** Examine the levels of effort and pecuniary costs of implementing each solution, and select the most efficient and cost-effective options.

- **Applicability:** Select the most useful methods, fields, standards, and data sets.

- **Relevance to Scope:** Use the methods, standards and data sets that are the most relevant to improving the matching process.

- **Alignment:** The Workgroup emphasizes best practices which best align to existing guidance and data standards, including guidance from, but not limited to, the National Information Exchange Model (NIEM), the International Organization for Standardization (ISO), and OMB memo M-13-13, "Open Data Policy – Managing Information as an Asset."

The Workgroup identified four practices that Federal programs and agencies may find useful in making it easier to match employer data:

Best Practices for Matching Data

The Workgroup identified a set of collection and algorithmic approaches that constitute the best practices in matching data on employers. Individuals conducting matches could use these methods rather than attempting to create a new method each time a match is to be conducted. The specific methods that produce the best results vary depending on the purpose of the match and the data fields that are available. These methods are described in greater detail in Appendices B and E, and a related bibliography is available in Appendix C.

It is worthwhile to note that the quality of a match depends largely on the quality of the underlying data in each data set. Before conducting a match, individuals should engage in data cleaning and standardization. In addition, employing a range of matching algorithms is critical to obtaining optimal matching results. Finally, individuals conducting a match should take advantage of data quality analysis; improvements in business rules, which improve data quality (by permitting data to be entered into a system if they meet certain criteria); and improved use and creation of data documentation to improve matching outcomes.

Data Inventory

One of the common challenges to matching employer data is the identification of data sets that are available for matching and what those data sets contain. To ease this identification process, the Workgroup identified a representative sample of the most frequently desired or most valuable data sets that the government currently collects. These data sets contain information on individual employers, firms, and/or establishments that have the widest coverage, greatest use, or which agencies are most interested in matching to other data sets. This data inventory is included as an attachment to the white paper. The data inventory includes information on the data sources' coverage of U.S. businesses, collection methodology, access restrictions, and information related to common fields for matching. CIPSEA limits the use of many of these data sources exclusively to statistical purposes.

Common Data Fields

Federal agencies can benefit from adopting the common data fields for matching purposes detailed in Table 1.[30] These fields are most commonly used in the methods described above and in Appendix B. Table 1 also accounts for existing guidance from other data-sharing initiatives (such as for Federal spending transparency data standards, and the National Information Exchange Model, or NIEM), and lessons learned from prior studies linking administrative and statistical data sources.[31] [32] [33] These fields can provide an exact match, and aid in matching even if an exact match is not possible due to variance amongst data sources.

Table 1 proposes a set of "Tier 1" fields, which are the most essential fields for matching and entity resolution. Agency data sources lacking these fields are very difficult to match, and the Workgroup believes Federal Agencies can achieve potential cost savings if their data sources universally incorporated Tier 1 fields. It is possible to compensate for missing fields by creating a matching profile from a combination of Tier 1 and non-Tier 1 data elements. Please note the following considerations for the Tier 1 fields:

- **Establishment-Focused:** Employer data is collected at various organization levels. The proposed framework emphasizes establishment names and addresses to enable matching with potential authoritative sources described in Appendix A. However, many Federal employer data sources do not always use establishment as the unit of analysis. Placeholders for other fields to describe organization level are included as Tier 2 fields.
- **Treatment of Identifiers:** Generally, the utility of Federal data sources in regards to matching, linkage, and reuse can be increased by including as many common identifiers as possible. Table 1 therefore includes a number of data elements to reflect this prioritization. Additionally, while these fields are useful for matching, it is important to note that identifiers have confidentiality, privacy, and proprietary concerns. Where possible, Federal agencies should include non-sensitive and non-proprietary identifiers. Ideally, Federal agencies would institute policies and processes that support consistent identification of employers within an agency. This would minimize the data cleansing necessary to identify the same employer involved in programs across Federal agencies.

These fields are generally common among 39 data sources in the data inventory. Federal data sources within this categorization commonly have multiple Tier 1 data fields available for matching, including: at least one identifier, legal and trade names, establishment physical location and mailing addresses, country codes, and data timestamps. Table 1 also shows web sites and e-mail addresses as Tier 1 fields.

Additional helpful fields include: information on the ultimate parent company, NAICS codes, latitude and longitude, and phone number. A number of these fields are proposed as Tier 2 fields in Table 1, as they inform

---

[30] Due to the variation in Federal agencies and programs, this Workgroup is not currently prescribing a process for agencies to use to implement the Common Data Elements, but a future effort could look into this.

[31] For further information, see "Federal Spending Transparency Data Standards" at MAX.gov, available at: https://max.gov/maxportal/assets/public/offm/DataStandardsFinal.htm

[32] NIEM is "a community-driven, standards-based approach to exchanging information." The U.S. Department of Homeland Security the U.S. Department of Justice, and the U.S. Department of Health and Human Services are the stewards of NIEM. or add a qualifier and data source for "majority"

See: https://www.niem.gov/aboutniem/Pages/niem.aspx https://www.niem.gov/aboutniem/Pages/history.aspx

[33] For example, see:

Krizan, C. J., Statistics on the International Trade Administration's Global Markets Program (September 1, 2015). US Census Bureau Center for Economic Studies Paper No. CES-WP-15-17. Available at SSRN: http://ssrn.com/abstract=2661478 or http://dx.doi.org/10.2139/ssrn.2661478

and enhance matching. A number of agencies do not have information on the ultimate parent or intermediate corporate entities in their data sources, but having this information would allow for hierarchical analysis (e.g. having all establishment identifiers each parent company uses). A third set of data elements are Tier 3 fields as they further support validation: the age of the firm in years, and the number of individuals employed by the firm.

Table 1: Initial Proposal for Common Data Fields

Priority	Field(s)	Field Definition	Examples of Relevant NIEM Core Type/Sub-Properties[34]
Tier 1	Identifiers	As many of the following elements as possible or feasible: • Employer Identification Number (EIN) • D-U-N-S Numbers • Legal Entity Identifier (LEI) • Commercial and Government Entity (CAGE) codes • Other cross-agency identifiers (e.g. UI account number) • Other Non-Confidential, Non-Proprietary Identifiers	**nc:OrganizationType** nc:OrganizationIdentification nc:OrganizationOtherIdentification **nc:IdentificationType** nc:IdentificationID
Tier 1	Legal Name	Legal Name of establishment.	**nc:OrganizationType** nc:OrganizationName nc:OrganizationBranchName
Tier 1	Trade Name	Trade Name, "Operating As" Name, or DBA of establishment.	**nc:OrganizationType** nc:OrganizationDoingBusinessAsName
Tier 1	Establishment Physical Location Address	The address is made up of six standardized components: Street Number, Street Name, and Building/Suite, City, State Code, and ZIP+4 or Postal Code. The address should follow the United States Postal Service's standardized address format (fully spelled out, abbreviated by using the Postal Service standard abbreviations or as shown in the current Postal Service ZIP+4 file). See also: http://pe.usps.gov/text/pub28/28c2_001.htm	**nc:OrganizationType** nc:OrganizationLocation **nc:LocationType** nc:Address **nc:AddressType** nc:AddressFullText
Tier 1	Establishment Mailing Address	The address is made up of six standardized components: Street Number, Street Name, and Building/Suite, City, State Code, and ZIP+4 or Postal Code. The address should follow the United States Postal Service's standardized address format (fully spelled out, abbreviated by using the Postal Service standard abbreviations or as shown in the current Postal Service ZIP+4 file). "NIEM core consists of data elements that are commonly understood and defined across domains, such as person, activity, document, location, and item. It's governed jointly by all NIEM domains."
From: https://www.niem.gov/technical/Pages/The-Model.aspx

Priority	Field(s)	Field Definition	Examples of Relevant NIEM Core Type/Sub-Properties[34]
Tier 1	Country Code	Country Code as defined by ISO 3166 (codes for the countries, dependent territories and special areas of geographical interest), FIPS 10-4, or Geopolitical Entities, Name and Codes (GENC).	**nc:AddressType** nc:LocationCountry nc:LocationCountryFIPS10-4Code nc:LocationCountryGENCCode nc:LocationCountryISO3166Alpha2Code
Tier 1	Time Stamp of Collection, Time Stamp when observation Last Edited, and Lag Time.	Date and Time of collection, Date and Time when an observation was last edited, and Amount of Time between the reference period and time the data are available.	**nc:DateRepresentation** **nc:MetadataType** nc:ReportedDate nc:LastUpdatedDate **nc:DateRangeType**
Tier 1	E-mail Address	A corporate E-mail address for respondent.	**nc:OrganizationType** nc:OrganizationPrimaryContactInformation **nc:ContactInformationType** nc:ContactEmailID
Tier 1	Web Site	URL of web site for entity.	**nc:OrganizationType** nc:OrganizationPrimaryContactInformation **nc:ContactInformationType** nc:ContactWebsiteURI
Tier 2	Telephone Number	Telephone number for entity.	**nc:OrganizationType** nc:OrganizationPrimaryContactInformation **nc:ContactInformationType** nc:ContactTelephoneNumber
Tier 2	Other Intermediate Entity Legal Name (If Applicable)	Legal Name of Other Intermediate Corporate Entity.	**nc:OrganizationType** nc:OrganizationName
Tier 2	Other Intermediate Entity Identifier	Identifiers of Other Intermediate Corporate Entity (see above guidance on Identifiers)	**nc:OrganizationType** nc:OrganizationName **nc:OrganizationType** nc:OrganizationIdentification nc:OrganizationOtherIdentification **nc:IdentificationType** nc:IdentificationID
Tier 2	Ultimate Parent Entity Legal Name	Legal Name of Ultimate Parent.	**nc:OrganizationType** nc:OrganizationParent nc:OrganizationParentAffiliate nc:OrganizationParentOrganization **nc:OrganizationType** nc:OrganizationName

19

Priority	Field(s)	Field Definition	Examples of Relevant NIEM Core Type/Sub-Properties[34]
Tier 2	Ultimate Parent Identifiers	Identifiers of Ultimate Parent (see above guidance on Identifiers)	**nc:OrganizationType** nc:OrganizationParent **nc:OrganizationType** nc:OrganizationIdentification nc:OrganizationOtherIdentification **nc:IdentificationType** nc:IdentificationID
Tier 2	NAICS Code	Six-Digit NAICS Code. 2017 NAICS revision.[35]	--
Tier 2	Latitude and Longitude of Establishment Physical Location Address	Latitude and Longitude of Establishment Physical Location Address, aligned to ISO 6709 and Federal Geographic Data Committee (FGDC.gov) established standards.	**nc:OrganizationType** nc:OrganizationLocation **nc:LocationType** nc:LocationGeospatialCoordinate
Tier 3	Establishment Age	Age of establishment in years.	**nc:DateRangeType** **nc:OrganizationType** nc:OrganizationIncorporationDate
Tier 3	Employment	Count of employees who are on the payroll, ideally for the pay period including March 12 of each year.[36] [37]	--

The fields in Tier 1, Tier 2 and Tier 3 vary in importance for individual offices. The Tiers shown in Table 1 reflect consensus on prioritized fields, but offices should account for variations. For example:

- Tier 2 elements become Tier 1 elements in establishment-based surveys. For example, phone numbers become an important Tier 1 field for not only identifying individual stores within an enterprise with one EIN, but also, having appropriate contact information for each store for future data collection activities. When matching on a city, there are many instances where the postal address is different from the municipal location. For example, New Jersey townships do not relate to what the postal service calls the location. Having additional fields, such as the County Code, further assist in matching.
- Fields in Tiers 2 and 3 may take on particular importance for regulatory activities. For example, it may be critical for a program to have information on intermediate and parent entities in order to engage the proper stakeholders for a compliance activity. Or, if an agency undertakes an investigation of a business that does not have an office, fields related to contact information may become critical for identification purposes.
- Also, some Tier 1 elements, such as the corporate e-mail address (following the "@" section) and/or Web site can be used to some extent as a self-identified definition of the "firm".[38]

[36] Derived from: http://www.census.gov/programs-surveys/cbp/about/glossary.html
[37] In instances where an entity has no employees, this field is equal to zero.
[38] For more information, see:
Krizan, C. J., Statistics on the International Trade Administration's Global Markets Program (September 1, 2015). US Census Bureau Center for Economic Studies Paper No. CES-WP-15-17. Available at SSRN: http://ssrn.com/abstract=2661478 or http://dx.doi.org/10.2139/ssrn.2661478

Federal agencies also want standardization and validation approaches for the Common Data Elements shown in Table 1, to maximize the quality of the data and ease of matching across Federal data sources.

- The table references NIEM Core data elements to take advantage of existing data standards, to which a number of Federal agencies have already agreed, for the Common Data Fields.[39]
- Table 1 shows Establishment Physical Location Address, and Establishment Mailing Address, with data entry of the street number, street name, and building/suite in separate variables, to expedite data cleaning. Table 1 also recommends use of the United States Postal Service's standardized address format for these fields.
- The data elements Legal Name, Trade Name, Other Intermediate Entity Legal Name, and Ultimate Parent Entity Legal Name should follow common formatting and validation standards to facilitate matching. For example, agency processes should account for legal entities which have a slightly different legal name in each state. Due to the range of approaches, which depend on project goals, the workgroup is not able to recommend a single standard or method. Rather, agencies should take advantage of existing methods for standardization and validation, which are further discussed in Appendix B. Also, Federal agencies should explore use of resources that help delve into correct names as well as legal filings.[40]

Data Collection Improvements

Federal agencies can achieve potential cost savings in data matching and reuse when they improve the quality of data at the point of entry. They accomplish this with changes in collection methods, subject to any legal requirements (e.g., the Paperwork Reduction Act of 1995), or with validation steps at the time of input. There is a range of methods for improving the quality of fields at the point of collection, resulting in higher quality data, fewer resources expended to clean data, and burden reduction for the regulated community.

First, agencies benefit from ensuring that they have clear reporting guidance for data collection activities to minimize variability in data quality. Robust and clear guidance, combined with a collection tool which reinforces the guidance, ensures that agencies minimize efforts in cleaning data.

Additionally, Application Programming Interfaces (APIs) for validating data have been proven to significantly improve data quality for matching while simultaneously reducing reporting burden. APIs on the front and back ends of data entry are highly useful for validating and standardizing the common data elements shown in Table 1. For example, the U.S. Environmental Protection Agency's Facility Registry Service (FRS), which integrates data on over 4 million establishments and places of interest from across 90 different systems, built an API which took advantage of existing, previously-collected data from internal data sources for entity resolution at the point of data collection.[41] The API allows reporters to identify establishments by searching and retrieving information that was previously reported via other systems from which the FRS ingests data. When a user searches for a particular firm, the application then allows newly reported information to be associated with existing, known establishment information and identifiers. This interface has been used for other EPA programs, such as the Toxic Release Inventory (TRI).[42] Within the TRI program, the EPA has seen significant data quality improvements and has estimated a burden reduction of 140,269 hours for reporters.

---

[39] See also: NIEM 3.2 (current release). Available at: https://www.niem.gov/technical/Pages/current-release.aspx
[40] One example of this is OpenCorporates, which scrapes the legal filings from the various State Departments of State. See: https://opencorporates.com/.
[41] "Facility Registry Service," *US Environmental Protection Agency, Office of Environmental Information*, Retrieved 09 Sep 2016 https://epa.gov/frs
[42] US EPA Toxic Release Inventory https://www.epa.gov/toxics-release-inventory-tri-program

Lastly, agencies benefit from having a strong understanding of respective data sources to be matched, anticipating data quality or consistency issues, and estimating the likely overlap in records for a point of comparison. Many agencies also provide points of contact who can discuss unusual or anomalous results, as well as steps they routinely use to optimize any attempted comparisons using their data. Common practices include:

- accounting for context in databases (such as knowing the context of the letters you are matching in a name),
- ensuring metadata is sufficiently descriptive to differentiate fields, and
- using forms with specialized functionalities (e.g. SmartForm) to validate and standardize data entered.

Authoritative Source

An authoritative source is a data source that provides current, accessible, and authoritative information on all data of a certain type. An authoritative source for data on business existence and characteristics would greatly improve the matching process, and could aid in reducing burden on employers. Such a source would contain validated information confirming existing or closed businesses, and characteristics for businesses such as geographic location, contact information, size, and industry. Additionally, this source would contain data capturing relationships among different levels of corporate and industry structures, and would be able to provide information on at least a quarterly basis on changes to these relationships. Making an authoritative source accessible would drastically improve the ability to validate data and conduct matches. It could also serve as the basis of a universal identifier in the future. Having an authoritative source would be useful for a variety of purposes including, but not limited to:

- **Entity resolution, including identity verification:** Having an authoritative source for cleaning or matching existing data, both during data entry (for example, confirming the identity of a reporting entity) and after (for example, when trying to match two data sets, executing resolution algorithm to show that two entities are actually the same), would reduce the time needed to reconcile data sources when matching them.
- **Sampling:** An authoritative source could enable Federal agencies to build valid sampling frames for surveys or program evaluations without having to rely on proprietary data sources.
- **Administrative purposes:** Authoritative sources could also assist with statistical processes within regulatory agencies, such as creating more accurate or precise estimates of various administrative or economic measures used as inputs for assessing agency performance (for example, examining compliance trends by normalizing for the size of an industry in a local area).

Currently there is no Federal data source that fits this description precisely. Appendix A describes a set of four potential data sets that could be the base for an "authoritative source." There are advantages and drawbacks to each of these sources, and further work would need to be done to determine how to enable Federal agencies to use these as authoritative sources. They include: the Business Register (Census Bureau), the Quarterly Census of Employment and Wages (BLS), the Business Master File (IRS), and the GLEIF Concatenated File (Global Legal Entity Identifier Foundation). While the three government data sources offer the greatest coverage, and are of the highest quality for identified uses, they have many legal and practical requirements and restrictions.[43] [44] The GLEIF Concatenated File has the advantage of being publicly available, but at this moment does not

---

[43] U.S. Census: Title 13. https://www.census.gov/history/www/reference/privacy_confidentiality/title_13_us_code.html
[44] IRS: Title 26. https://www.irs.gov/tax-professionals/tax-code-regulations-and-official-guidance

cover a range of industries and establishments in a manner similar to the other three sources. Please see Appendix A for additional information.

The Workgroup also suggests further investigation towards creating federal protocols to support data sharing, such as the creation of centralized data sharing guidance. For example, some statistical agencies can allow programs with approved projects (including program evaluations) to detail employees to overcome impediments to cross-agency data sharing. Additionally, some agencies might adopt the model set by the State of Illinois's Department of Innovation and Technology, which in 2016 developed a government-wide MOU that defined a common data taxonomy, standardized internal controls, streamlined data sharing, and established an arbitration process. As a result, data requests are no longer "ad-hoc." They are processed in a matter of days—like FOIA requests—through a process described by the Department's General Counsel as "safe, quick, and transparent."[45] Several agencies, notably the Social Security Administration, have strong internal data sharing protocols that could be replicated on a larger scale. It may also be possible for the Federal government to follow aspects of the Illinois model without requiring changes to statute.

In light of the significant legal barriers, or policy and legal interpretations associated with the confidential sources noted in Appendix A,[46] agencies can instead maximize the use of their existing data by setting up validation and entity resolution checks at the point of data entry, or determine how to improve data sharing practices accounting for the models just described.

Over the long term, Federal Agencies may consider a range of options for additional best practices. For example, it would be beneficial to look into the possibility of combining the authoritative sources noted in Appendix A to create a new mapping table that only contains data necessary for entity resolution, and which could be available to a wider audience of Federal agencies. This could be treated as distinct from the other sources, may not have the same access restrictions as the underlying source, and would be similar to data sets where the data are confidential but can be shared in a masked or aggregated form. Alternatively, it would be useful to further examine to what extent an authoritative source could be constructed that does not contain confidential data, and to examine the quality of such a source relative to confidential sources.

NEXT STEPS

The Workgroup has developed additional recommended topics for investigation that could help improve the sharing of employer data:

- The establishment of an interagency community of practice and repository for sharing methods, code, and approaches to data collection and matching. Federal agencies might benefit from continuing to share knowledge in a structured manner, to ensure that Federal analysts take advantage of the most efficient matching and data collection approaches for a variety of applications. Offices within the Workgroup are able to assist in the establishment and maintenance of the group so that it would continue to be meaningful and useful for participants.
- Consultation with a broader Federal and external audience to gain additional insights from external experts and front-line statisticians.
- The establishment of a centralized data sharing "referee." Federal agencies have expressed an interest in finding ways to expedite and facilitate data sharing, and have identified a centralized office as key to achieving this. Such an office could develop common data sharing protocols, serve as a library of data

---

[45] Testimony of Michael Basil, General Counsel, Department of Innovation and Technology, State of Illinois before the Second Meeting of the Commission on Evidence-Based Policymaking, September 9, 2016.

sharing agreements, and otherwise serve as a home for knowledge and process for interagency data sharing.

CONCLUSION

There is substantial potential to achieve efficiencies in matching U.S. employer data across Federal data sets for data analysis, evaluations, and statistical activities, based on common needs across agencies. The greatest barrier to matching data on employers across data sets is the lack of a common, or universal, business identifier. Eliminating this obstacle by developing an infrastructure to create, assign, and manage a universal identifier could result in cost savings in matching but would require a major investment of time and taxpayer resources. Assuming that the identifier could be created, it would be a challenge to enforce consistent use of such an identifier by all employers without statutory changes. This identifier would need to capture various corporate/industry levels and change over time, but no Federal entity collects all of this information.

Nevertheless, there are immediate steps agencies can take to adopt best practices for data collection and matching, and there are ways to maximize the use of existing authorities and data sets to enable matching. In particular, leveraging data elements common among Federal agencies which, in combination, can constitute a universal unique identifier, would facilitate efficiencies for matching Federal data sources. The utility of Federal data sources can be increased by including as many cross-agency identifiers as possible. While these fields are useful for matching, it is important to note that identifiers have confidentiality, privacy, and proprietary concerns.

Moving forward, there are potential places to go further to realize long-term improvements, such as developing a roadmap for implementing common data elements in Federal data sources, developing an authoritative source of business existence and characteristics for Federal agencies, developing a Federal community of practice for matching and entity resolution, and establishing a centralized data sharing "referee."

APPENDICES

Appendix A: Potential Authoritative Sources

The workgroup identified four existing data sets that could serve as the basis for potential authoritative sources of business existence and characteristics across agency missions and program functions (see Table A1 for additional information):

Business Register, U.S. Census Bureau
The Census Bureau's Business Register contains establishments of all domestic businesses (except agriculture, forestry, fishing, hunting, rail transportation, the U.S. Postal Service, elementary and secondary schools, colleges and universities, labor organizations, political organizations, religious organizations, public administration, and private households) and organizational units of multi-establishment businesses.   A single-unit enterprise's primary identifier is its Employer Identification Number (EIN).   A unique employer unit identification number identifies each establishment owned by a multi-unit enterprise on the Business Register.

Advantages: The Business Register (BR) covers more than 160,000 multi-establishment companies, representing 1.8 million affiliated establishments, 5 million single establishment companies, and nearly 21 million non-employer businesses (note, Census maintains a separate register for employers and non-employers).[47] The Business Register is updated continuously, and the update frequency varies by its sources. Lags also vary, by the reference period of the sources. The Business Register is one of the most complete, current, and consistent source of establishment- based information about U.S. businesses, and is essential to assuring full coverage and high quality in Federal economic statistics programs.[48]

Considerations: Users should note that the source excludes a significant number of industries, including, most notably, agriculture, education, and public sector. Additionally, due to the lags in the data, users should exercise care in analyses of industries and sectors with high turnover or conversion rates. This data set contains links between establishments and their parent firms, but these links are sometimes recorded a year or more before or after the reference date. [49] Also, the Census Bureau's Business Register is constructed using comingled confidential tax information and non-tax data from various sources, including Census surveys. The fact that the Census Bureau's Business Register contains confidential tax information prevents the Census Bureau from completely sharing its Business Register with other agencies not authorized to receive the confidential tax information under Title 26.

Business Master File, Internal Revenue Service
The Business Master File (BMF) contains data for all Federal business tax returns that meet IRS filing requirements. The data set consists of individually filed returns for a single establishment and consolidated filed returns consisting of a group of related (affiliated) establishments. BMF data are updated continuously but usually become available weekly. The unit of analysis is tax return-based, as filed by the taxpayer; enterprises are not aggregated by the IRS.

Advantages: The data set consists of total population data based on taxpayer filings. Also, the availability of Employer Identification Numbers allows for direct linkages.

---

[47] See also: https://www.census.gov/econ/overview/mu0600.html
[48] Ibid.
[49] See also: www.bls.gov/osmr/pdf/st140030.pdf

Considerations: The unit of observation is a tax return, which is a higher, and different, level than establishment or physical location for multi-establishment businesses. This differs from both the Census Bureau's Business Register and Quarterly Census of Employment and Wages Business Register. Even for businesses that are not filing within a consolidated group, a return may not represent an establishment, for example in cases where a single business has operations located at more one physical address. Entity information such as addresses is based on taxpayer-reported information and may not necessarily be the actual physical address for matching purposes.

U.S. Bureau of Labor Statistics-Office of Employment and Unemployment Statistics, Quarterly Census of Employment and Wages (QCEW) Business Register (BR)
The QCEW-BR contains employment, wages, and administrative data (name, location, etc.) for over 9.5 million establishments, covering approximately 98% of all employment. The Quarterly Census of Employment and Wages (QCEW) provides data for establishments on monthly employment, total quarterly wages, the number of business establishments, and other business identification information such as address, industry, and federal employer identification number, etc. In addition to being very comprehensive and accurate data, the QCEW-BR is timely: data are available 6 months after the reference quarter making this the most current source of comprehensive business establishment data available.

The QCEW data are the product of a federal-state cooperative program. The data are derived from summaries of employment and total pay of workers covered by state and federal unemployment insurance (UI) legislation and provided by State Workforce Agencies (SWAs). States prepare a microdata file each quarter and submit that to BLS within 15 weeks of the end of the quarter. QCEW data are developed for the 50 states, the District of Columbia, Puerto Rico, and the U.S. Virgin Islands. The summaries are a result of the administration of state unemployment insurance programs that require most employers to pay quarterly taxes based on the employment and wages of workers covered by UI. Employment and wage data for workers covered by state UI laws are compiled from quarterly contribution reports submitted to the SWAs by employers. For federal civilian workers covered by the Unemployment Compensation for Federal Employees (UCFE) program, employment and wage data are compiled from quarterly reports submitted by four major federal payroll processing centers on behalf of all federal agencies.

BLS sets quality standards in state cooperative agreements and provides conceptual, technical, and procedural guidance to the states and uses standardized procedures to process these data and ensure consistent quality across states. State workforce agencies are responsible for collecting the administrative records from their state unemployment insurance system and transform these records into meaningful economic data. In addition to state data quality improvements, BLS conducts additional data review at its regional and national offices to ensure quality.

BLS also enhances the data with two supplemental surveys:

- The Annual Refiling Survey, which allows BLS and the states to collect updated North American Industry Classification System (NAICS) industry codes, geographic county codes, and address information for business establishments.
- The Multiple Worksite Report, which allows BLS to collect detailed monthly employment and total wages each quarter for businesses with more than one location. This allows the program to capture business births and deaths in a timely and frequent manner and accurately capture changes in ownership as a result of mergers and acquisitions.

BLS links the microdata for each business establishment across quarters to create a longitudinal record. These data are available starting in 1990 through the most recent data available: second quarter 2016. This linked

microdata file serves as the sampling frame for BLS establishment-based surveys such as the Current Employment Statistics (CES), a key survey used for the publication of the monthly Employment Situation. Other BLS programs that use the QCEW microdata for sampling purposes include the Job Openings and Labor Turnover Survey (JOLTS), Occupational Employment Statistics (OES), Producer Price Index (PPI), Survey of Occupational Injuries and Illnesses (SOII), National Compensation Survey (NCS), including the Employment Cost Index (ECI) and Employer Benefits Survey (EBS), and the new Occupational Requirements Survey (ORS). The Local Area Unemployment Statistics (LAUS) program also uses the QCEW as its source of employment when CES estimates are not available.

In addition, BLS publishes Business Employment Dynamics (BED) statistics drawn from this linked microdata set. BED statistics are created from the linked individual business establishment records that are tabulated to create aggregate time series for national and local business establishment openings, closings, expansions, and contractions, all by industry. Over the years, additional variables have also been created, including establishment age, survival rates, and firm size.

The QCEW program publishes tabular data for the nation, states, metropolitan statistical areas, and counties at a detailed NAICS 6-digit industry level about 6 months after the end of the reference quarter. The release date for QCEW data has been moved up by a total of 3 weeks since 2012. The data are valued for their comprehensiveness, accuracy, relevance, and timeliness.

Business Employment Dynamics statistics are published in the month following the release of the QCEW tabular data. These statistics have gained a wide user base as economists and other analysts continue to examine the role of employment dynamics in the U.S. economy. Key user groups of BED statistics include the Federal Reserve System, the Small Business Administration, and academics.

Key users of tabular QCEW data include Congress, state and local economic development agencies, state revenue forecasters, and numerous Federal agencies. Over $300 billion in public funds are allocated based on QCEW data.

Among the many users of QCEW data, four demonstrate some of the data's varied roles:
- The Employment and Training Administration (ETA) uses QCEW data to measure the solvency of unemployment insurance trust funds and to develop the statistical adjustment models for measuring quarterly performance of Workforce Innovation and Opportunity Act (WIOA) funded core programs.
- The Bureau of Economic Analysis (BEA) uses the quarterly QCEW data to develop county, state, regional, and national personal income estimates, a component of the gross domestic product, and to conduct related statistical research and analysis. In 2015, covered workers received $7.385 trillion in pay, representing 94.0 percent of the wage and salary component of personal income and 40.9 percent of the gross domestic product.
- Census Bureau
  - Since 1990, BLS has shared NAICS codes with the Census Bureau to improve industry coding consistency and reduce respondent burden and costs. The Census Bureau uses these industry data in its Business Register, which serves as a source of sampling frames for frequent business surveys (such as the Annual Survey of Manufacturers) and as a basis for statistical tabulations. The most important benefits of this data-sharing project are relieving American businesses of unnecessary response burden, improving industry coding for the Census Bureau, improving usability and promoting consistency between federal statistical products, and reducing redundancy between agency statistical programs, to the exceptional benefit of the American taxpayer.

27

- o In addition, after states and BLS have edited and curated the microdata, the QCEW data file is sent to the Census Bureau, where the data serve as a primary input for the Longitudinal Employer-Household Dynamics (LEHD) program.
  - o QCEW data are also used to calibrate the joint BLS-Census Current Population Survey after each decennial census.
- Outside researchers also apply for access to the QCEW microdata in a protected environment for projects that are relevant to the mission and scope of BLS.

By publishing QCEW and BED data, and by sharing these data amongst our statistical partners, BLS provides informational infrastructure that enhances the ability of the public and private sectors to make evidence-based decisions.

Advantages: The QCEW-BR contains data for all industries (including government), and coverage is mandatory, therefore compliance is high. In addition, the data set has consistent terms, is accurate, timely, relevant, and has a strong validation process. The QCEW-BR is sharable, subject to state data sharing restrictions. It is also a high frequency data set with quarterly data collection for monthly employment values. The QCEW data set is sustainable and scalable. There are a number of matching projects and new data products that can be developed with little or no new response burden at little or no additional cost (i.e., nonprofit data, etc.).

Considerations:
Exclusions from QCEW include self-employed workers, most agricultural workers on small farms, all members of the Armed Forces, elected officials in most states, most employees of railroads, some domestic workers, most student workers at schools, and employees of certain small nonprofit organizations.

There are some states who do not agree to share their data. A law change allowing for full data sharing would enhance the usability of QCEW data.

Global Legal Entity Identifier Foundation, Concatenated Data File
The Global Legal Entity Identifier Foundation (GLEIF) publishes the updated GLEIF Concatenated File daily. This file contains the content of the individual files, published by the Legal Entity Identifier (LEI) issuing organizations, which list all LEIs issued to legal entities and related LEI reference data. The data provides information on a legal entity identifiable with an LEI.

Advantages: The key advantage of the GLEIF Concatenated File, relative to the other sources noted, is that it is publicly available. The Global Legal Entity Identifier Foundation notes on their web site, "The drivers of the LEI initiative, i.e. the Group of 20, the [Financial Stability Board] and many regulators around the world, have emphasized the need to make the LEI a broad public good. The Global LEI Index, made available by GLEIF, greatly contributes to meeting this objective. It puts the complete LEI data at the disposal of any interested party, conveniently and free of charge."[50] The GLEIF Foundation will also be collecting information on parent and subsidiary entities during the annual re-registration for LEI numbers in 2017, and plans to continue this data collection in future years.[51]

---

[50] "Introducing the Legal Entity Identifier (LEI)." Global Legal Entity Identifier Foundation. <https://www.gleif.org/en/about-lei/introducing-the-legal-entity-identifier-lei>. Accessed 12/9/2016.
[51] https://www.gleif.org/en/lei-data/access-and-use-lei-data/level-2-data-who-owns-whom

Considerations: While the LEI is intended to be a universal and open identifier, coverage is currently low. As of the time writing this there are fewer than 500,000 LEIs issued globally, though this number is expected to increase over time as government's and institutions mature their processes using this identifier. Additional considerations regarding application of the LEI can be found in the November 2015 *Progress report by the Legal Entity Identifier Regulatory Oversight Committee (LEI ROC).*[52]

---

[52] Available at: https://www.leiroc.org/publications/gls/lou_20151105-1.pdf

Table A1: Options for Authoritative Sources

Component Agency or Office	Data set Name	Purpose of the Data Collection	Access Restrictions, Update Frequency and Lags	Coverage	Definition of "Company"	Unit of Analysis, Corporate Structure and Relationships	Quality of Fields for Matching
U.S. Census Bureau	Business Register	To provide a current and comprehensive database of U.S. business establishments and companies for statistical program use.	The Business Register information is confidential [Title 13 and Title 26, US Code]. Access is restricted to persons specially sworn to uphold the confidentiality provisions of Title 13 and Title 26. Data are updated continuously, update frequency varies by sources; lags vary by the reference period of the sources.	Establishments of all domestic businesses (except agriculture, forestry, fishing, hunting, rail transportation, the U.S. Postal Service, elementary and secondary schools, colleges and universities, labor organizations, political organizations, religious organizations, public administration, and private households) and organizational units of multi-establishment businesses. The Business Register (BR) covers more than 160,000 multi-establishment companies, representing 1.8 million affiliated establishments, 5 million single establishment companies, and nearly 21 million non-employer businesses.	An establishment is a single physical location where business transactions take place and for which payroll and employment records are kept. Groups of one or more establishments under common ownership or control are enterprises. A single-unit enterprise owns or operates only one establishment. A multi-unit enterprise owns or operates two or more establishments.	Establishment-based.	The Business Register is one of the most complete, current, and consistent source of establishment- based information about U.S. businesses, and is essential to assuring full coverage and high quality in Federal economic statistics programs. Examples of quality considerations for this source include: - The annual Company Organization Survey covers 30 percent of multi-unit companies and a small sample of firms that were single-unit firms in the most recent quinquennial Economic Census, so establishment openings and closings in the firms not covered may not be reflected in the business register until after the next Economic Census (though the Census Bureau takes measures to address this). - The business register is divided into employer and non-employer business registers based on payroll employment. Some firms lease their employees from Professional Employer Organizations (PEOs) or use independent contractors. Such firms may appear in the non-employer business register despite having large revenues and many leased and/or contract employees. (https://www.census.gov/econ/overview/mu0600.html)

30

| U.S. Bureau of Labor Statistics-Office of Employment and Unemployment Statistics (OEUS) | Quarterly Census of Employment and Wages (QCEW) Business Register (BR) | To provide a quarterly census of all establishments under State unemployment insurance programs, representing about 98 percent of employment on nonfarm payrolls. This database of U.S. business establishments serves as the basis for multiple statistical programs; Sampling frame & benchmark(CES, JOLTS, PPI, OES, LAUS, SOII, and NCS, which includes the ECI, EBS and ORS), labor market research, Business Employment Dynamics (BED) data. | All microdata are confidential subject to BLS non-disclosure standards.

The QCEW BR is updated quarterly, and the data become available 6 months after the reference cycle. | Employment, wages, and administrative data (name, location, etc.) for over 9.5 million establishments covering approximately 98% of all employment. | An economic unit that produces goods or services, usually at a single physical location, and engages in one or predominantly one activity. --Potential lay synonyms: business, worksite, brick& mortar, site, storefront. Lay users my use "establishment" interchangeably with "firm" In the QCEW BR, however, there is a significant distinction between the two terms. | Establishment-based.

Multi-unit enterprises may use multiple EINs, and they may use different ones when reporting to different Federal agencies, complicating the matching process. The data set indicates whether an establishment is a single or multi-location establishment. | In order to ensure the highest possible quality of data from the QCEW program, BLS and the States verify and update, if necessary, the NAICS, location, and ownership classifications of all units on a 3–year cycle. Government units in public administration are not reviewed routinely. |

Internal Revenue Service - Statistics of Income	**Business Master File**	IRS: The purpose of data collection is mainly for determining Federal tax liability for businesses required to file. SOI: The data are used to produce statistics on income, deductions, credits and other taxes, as reported by businesses. The current design is a probability sample stratified by Business type (as indicated by the IRS form filed) and either by size of total assets alone or size of total assets and a measure of income.	Federal Tax Information (FTI) is confidential [Title 26, US Code] and shared with other government agencies under IRC 6103(j) provisions. Data are updated continuously; Data becomes available weekly.	IRS: All Federal business tax returns that meet IRS filing requirements. SOI: Selected active Federal business tax returns based on SOI's sample design.	Definition of "company" is based on Title 26 requirement.	Tax Return. The data set consists of individually filed returns which can represent: corporations (a single establishment; subsidiary establishment or consolidated filed returns representing a group of establishments); partnerships and other pass-through entities; or sole proprietorships.	Most matching is accomplished using the EINs provided by entities as reported on Federal tax returns. SOI uses exact matching with EINs and data processing begins with information already extracted for IRS administrative purposes. SOI performs limited internal "data cleaning" for statistical purposes. This includes organizing data to make it structurally consistent, coding data items to make them analytically useful, and validating values to ensure mathematical consistency. Contact information is validated as part of routine administrative processing of returns at the time they are received by the IRS.
Global Legal Entity Identifier Foundation	**GLEIF Concatenated File**	The Global Legal Entity Identifier Foundation (GLEIF) publishes the updated GLEIF Concatenated File daily. This file contains the content of the individual files, published by the Legal Entity Identifier (LEI) issuing organizations, which list all LEIs issued to legal	Publicly available without restrictions	All legal entities are eligible to receive an LEI. As of the time writing this there are 465,397 LEIs issued globally.	As defined in ISO 17442, the standard underlying the Legal Entity Identifier (LEI), the term 'legal entity' includes, but is not limited to, unique parties that are legally or financially responsible for the performance of financial transactions or have the legal right in their jurisdiction to enter independently into legal contracts, regardless of whether they are incorporated	Legal entity based	Very high quality where available. There is a validation effort done whenever an entity applies for an LEI. This ensures a distinct unique record exists for each identifier (). The LEI identifies an entity across multiple data sets where required by regulation. See the following report for additional information: https://www.leiroc.org/publications/gls/lou_20151105-1.pdf

32

		entities and related LEI reference data. The data provides information on a legal entity identifiable with an LEI			or constituted in some other way (e.g. trust, partnership, contractual). It excludes natural persons, but includes governmental organizations and supranationals.		

APPENDIX B: Best Practices for Matching Data

The Workgroup's Methods Inventory yielded a variety of strategies in data collection and data integration which Federal agencies use to work around issues in matching and entity resolution. See Appendix E for specific code examples.

DATA COLLECTION

Federal agencies maximize the use of identification approaches during the data collection phase to improve matching to prevent downstream challenges in matching and entity resolution. These approaches focus on identifying the right entity and industry or corporate relationships, and validating geographic and industry information.

Identifying the right entity, right level and right relationship

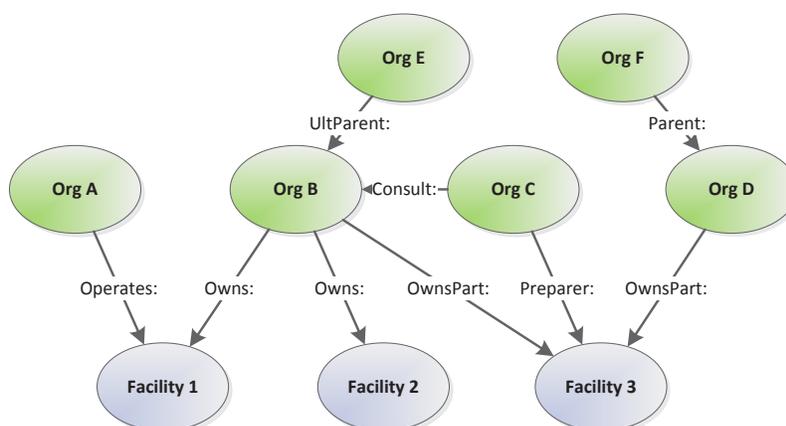
Relationships

Federal agencies often encounter complex industry or corporate structures, and work to identify the correct entities, corporate and industry levels, and corporate and industry relationships at the point of data collection to avoid challenges in matching or entity resolution later.

- For example, a facility may be owned by one company but another may control its operation (this was the case with the Deepwater Horizon disaster – the rig was owned by Transocean, but leased by British Petroleum (BP) and operated by Transocean and other contractors under BP's direction[53]).
- There may also be cases where a facility has one or more contractors who each have their own compliance, regulatory and reporting requirements co-located within the same facility, such as a steel mill.
- Another scenario exists in the case of joint ventures, where a facility may be owned and/or operated by multiple parties. Additionally, there may be an owner or operator entity being captured at the facility level, but also some degree of org parent information, whether an ultimate global parent or domestic parent.
- Lastly, Figure B1 shows an agency example where Facility 1 is owned by Organization B, but operated by Organization A; Organization B also owns Facility 2 and is part owner (via Joint Venture or other vehicle) of Facility 3, Organization B lists as its ultimate parent Organization E, however there may be intermediate entities not captured; Organization B also retains Organization C as a consultant to aid in preparation of regulatory documentation for Facility 3. Facility 3's remainder owner is Organization D which lists Organization F as its parent, however Organization F might not be its ultimate parent.

---

[53] See also: Final Report of the National Commission. http://oscaction.org/resource-center/commission-reports-papers/

**Figure B1: Example of a Complex Industry Structure
at the point of Data Collection**


It is due to cases such as these that applications and data owners need to be cognizant of the importance of very robust and clear guidance, and good data structures for capturing this information, paying close attention to the contextual relationships.   Agencies have found that relational, NoSQL, RDF triple stores and/or graph databases work well for capturing these types of complex relationships in the data.

Establishment Facility Name

Often, difficulties in matching stem from inconsistent approaches and guidance for providing establishment names, for example providing only one organization name for a campus which comprises multiple operations and facilities which report to agencies separately from each other (for example a large university which may have physical plant and utilities versus labs and other facilities each with independent permitting, compliance and reporting responsibilities).   In some cases, one may need sufficient information in order to disambiguate, requiring enough information and consistency in reporting. In other instances, one may need to merge and de-duplicate data, and a lack of consistency can also be an issue in achieving this.

Table B1: Variations in Establishment Name

Establishment Name
Widgetco
WidgetCo Plant 2
Plant 2
Second Unit Widget Co

Contact Information

Data elements such as email addresses or telephone numbers can also be used to identify relationships in data and assist in entity resolution; for example one single point of contact is associated with over 4,000 chain drugstores in EPA's Resource Conservation and Recovery Act data set. Similarly, telephone numbers can also be a useful tool in entity resolution.   As with the prior cases, data entry and reporting interfaces should include

validators to ensure proper formatting and values that appear valid. A number of JavaScript form validators exist [54] which can aid in these tasks.

Web sites, and e-mail addresses (after the "@" section) can not only serve as potentially valuable linking variables, but also as firm identifiers. Web sites and e-mail addresses are not subject to the same sorts of variation or mis-spellings that corporate names are. Similarly, while a corporation may have many regional telephone numbers, it will only have one domain name. Finally, companies will self-sort their economic activities into the appropriate Web domain names, likely based on activity, in cases where they undertake multiple, disparate business activities.

Geography-Related Fields

Address fields

As with entity reporting, for address fields, clear guidance and documentation needs to be implemented for collection interfaces, as well as providing the appropriate data structures for capturing separate values for physical and mailing/administrative address.

Ideally, systems should provide geocoding capabilities which can validate and standardize entered street addresses, i.e. 528 South Fourth Street standardized to 528 S 4th St per USPS standard to aid in disambiguation. For large factories, in particular, it is also useful to specify where on the establishment the latitude and longitude will be established. Geocoding APIs typically also provide an effective mechanism for parsing and standardizing street address elements, such as house number (528) / street directional (S) / street name (4th St). Additionally, a geocoding API[55] can provide latitude/longitude values which can easily be used to display a web map view for additional visual verification of site locations in reporting interfaces.

There are also cases where establishments might not have conventional street addresses, for example remote facilities in oil and gas sectors, or many Puerto Rico addresses which are linear addresses by distance marker along a route. Some typical cases may involve public works infrastructure where often the City Hall address is provided, or a PO Box is provided in place of the physical address, when quite likely both are wanted. Many systems also struggle to differentiate adequately in the case of multi-establishment addresses, whether office buildings, suites, incubators or industrial parks sharing an address, or other similar cases. Foreign addresses are also often problematic in many systems. Table B2 contains examples of commonly-encountered but difficult-to-resolve addresses.

Table B2: Examples of Common, Difficult-to-Resolve Addresses:

Street Address 1	City	State	ZIP
PR 181, KM. 18.2, BO. ESPINO	SAN LORENZO	PR	00754
NW1/4 S27 T48N R77W	JOHNSON COUNTY	WY	99999
H.C. 64 BOX 204	MCFADDEN	WY	82083

---

[54] "Validators," *formvalidation.io*, Retrieved 09 Sep 2016
http://formvalidation.io/validators/

[55] "Geocoding", *Wikipedia*, Retrieved 09 Sep 2016
https://en.wikipedia.org/wiki/Geocoding

47 MI W OF LARAMIE ON I-80 EXIT 267	LARAMIE	WY	82070
43 32' 11" N 108 49' 29"W	KINNEAR	WY	82516
90TH SUPPORT GROUP, DEV BLVD 320	CHEYENNE	WY	82005

When conventional street addresses cannot be provided, where appropriate and feasible, a clear mechanism should be provided for capturing alternative addressing schemes to improve how these can be dealt with and resolved. For example, WGS84 lat/long values are relatively easy to capture and collect with the advent of ubiquitous GPS technology on mobile devices, as well as the ease of embedding web based mapping applications which can capture a coordinate. When capturing data via latitude/longitude, existing data standards should be implemented, such as ISO 6709:2008[56] for entry and representation of latitude/longitude values. Additionally, consideration should be given to decimal degrees and precision for entry of latitude/longitude. Public Land Survey System (PLSS) references such as NW1/4 S27 T48N R77W are tied to Bureau of Land Management Survey Grid and BLM has web services for determining location based on the descriptive elements[57]. Guidance and consistency in entry of the elements to facilitate parsing for a web service would be another necessary consideration in implementing PLSS entry.

As a final caveat, it should also be noted that postal municipality might not be the same as the jurisdictional municipality where the establishment is located.

Latitude / Longitude Fields

Latitude/Longitude, where available, is a useful data element to use for proximity matching. Degree of precision of the entered latitude/longitude data impacts spatial resolution - and while the distance spanned by a unit of measure will typically be consistent for north/south parallels of latitude, it will vary for east/west meridian values as a function of varying latitude due to meridian convergence at the poles, as shown in Figure B2:

Typical distance values corresponding with various levels of angular precision are as follows:

Table B3: Typical Distance Values Corresponding with Various Levels of Angular Precision

Decimal places	Decimal degrees	DMS	Qualitative scale that can be identified	N/S or E/W at equator	E/W at 23N/S	E/W at 45N/S	E/W at 67N/S
0	1.0	1° 00′ 0″	country or large region	111.32 km	102.47 km	78.71 km	43.496 km
1	0.1	0° 06′ 0″	large city or district	11.132 km	10.247 km	7.871 km	4.3496 km
2	0.01	0° 00′ 36″	town or village	1.1132 km	1.0247 km	787.1 m	434.96 m
3	0.001	0° 00′ 3.6″	neighborhood, street	111.32 m	102.47 m	78.71 m	43.496 m
4	0.0001	0° 00′ 0.36″	individual street, land parcel	11.132 m	10.247 m	7.871 m	4.3496 m
5	0.00001	0° 00′ 0.036″	individual trees	1.1132 m	1.0247 m	787.1 mm	434.96 mm
6	0.000001	0° 00′ 0.0036″	individual humans	111.32 mm	102.47 mm	78.71 mm	43.496 mm
7	0.0000001	0° 00′ 0.00036″	practical limit of field surveying	11.132 mm	10.247 mm	7.871 mm	4.3496 mm

Latitude/Longitude comparison will be discussed later in this document under Haversine Distance matching.

Industry Fields

NAICS/SIC Codes

North American Industry Classification (NAICS)[58] and Standard Industrial Classification (SIC)[59] Codes, may also be a helpful asset toward matching or disambiguating establishment records. For example, certain NAICS and SIC codes are relatively rare, such as Nuclear Electric Power Generation - NAICS: 221113. Additionally, groupings of related and unrelated NAICS/SIC codes could be used in business rules, such as codes which typically do not appear within the same establishment. SIC codes have technically been retired, however some agencies and data sets still use SIC, i.e. SEC, OSHA and others. One thing to note is that NAICS codes are revised on a regular cycle of 5 years, the most recent revisions being 2012 and 2007. As such, in capturing NAICS data, it would be useful to also reference the NAICS version being used, i.e. NAICS:2012. The U.S. Census Bureau provides reference data on NAICS codes, which can be used to populate API-based entry or picklists as opposed to allowing manual entry of codes, to reduce data entry errors.

Hierarchy Field

Knowing which establishments are part of which parent companies (updated quarterly) is incredibly useful for matching efforts at different employer levels.

COLLECTION METHODS

Leveraging Existing Data via API for Entity Resolution: Example case at US EPA

Existing, previously-collected data may be one of the best tools available for entity resolution at the point of data entry. It is critical to highlight examples that enable agency employees to make an internal case for changes. Agencies should note that EPA has begun leveraging its Facility Registry Service (FRS)[60] for that purpose. FRS integrates data on over 4 million establishments and places of interest from across 90 different systems via master data management and a combination of algorithmic methods and manual data steward curation. The FRS team developed an API to improve integration at the point of data collection, by allowing reporters to identify establishments by searching and retrieving information that was previously reported via the various systems that FRS ingests data from.

This capability is illustrated in the following screen shots, in which a user searches for "Finch Paper" on Glen Street in Glen Falls, NY:

---

[60] "Facility Registry Service," *US Environmental Protection Agency, Office of Environmental Information*, Retrieved 09 Sep 2016 https://epa.gov/frs

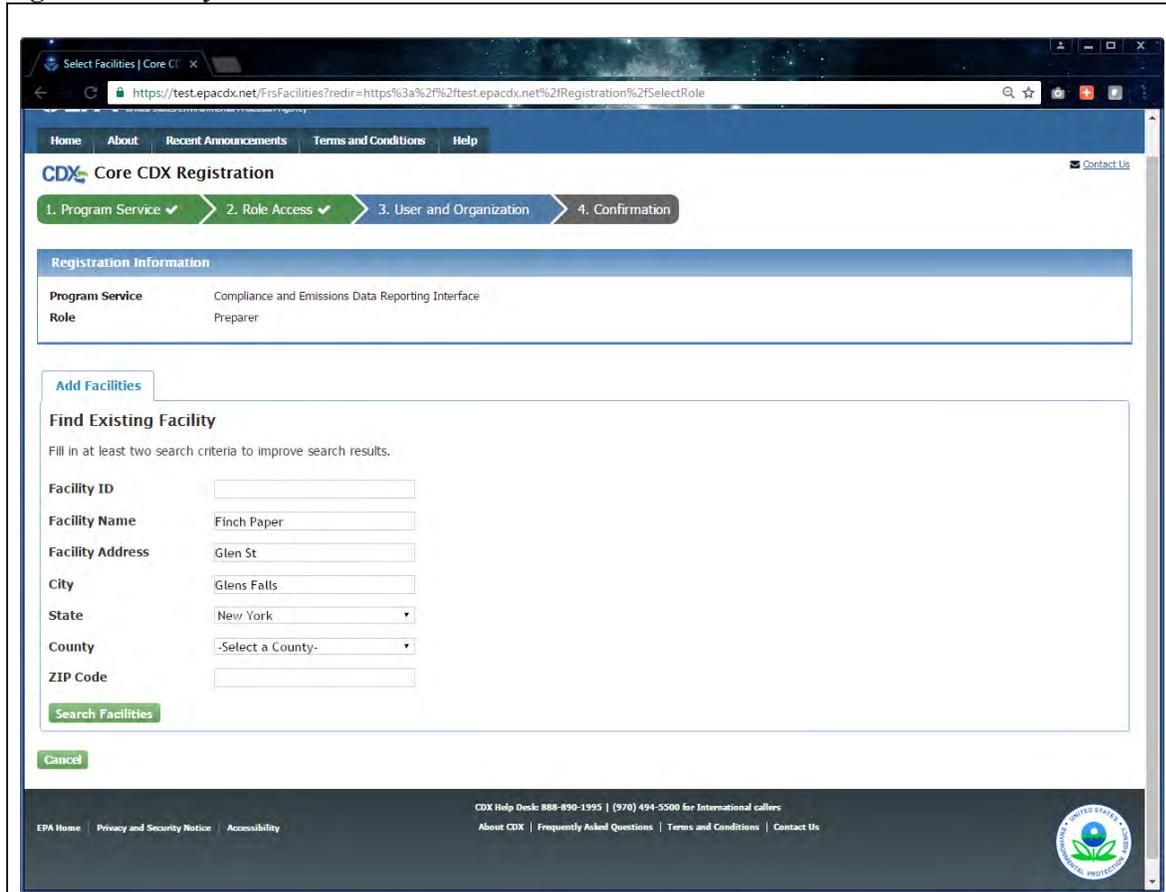
Figure B3: *Entity Search to call API*


Figure B4: Entity API Search Results

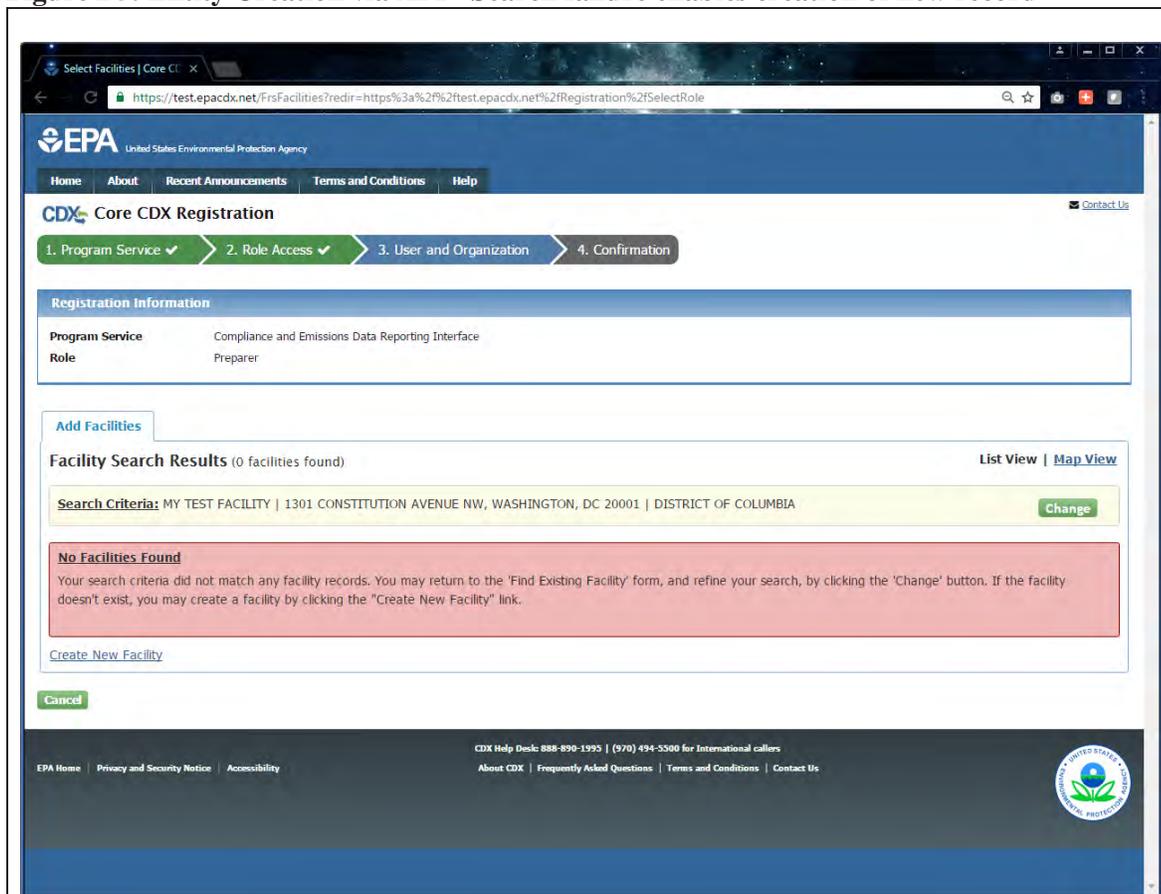
The application would then allow newly reported information to be associated with existing, known establishment information and identifiers.

Initially this API was a read-only API for data retrieval, however it has since evolved to provide additional capabilities, including:

- The ability to submit a suggested update (for example, if an establishment had a typo in its information or if it was acquired by a new firm and the establishment's name needs to change), or
- if a new facility is being reported, the API will allow a master record and unique identifier to be generated in real-time, which will then subsequently be available for other queries.

An example of creating a new facility is shown in the following figure:

Figure B5: Entity Creation via API - Search failure enables creation of new record


On clicking the "Create New Facility" button, the user is then presented with a view that presents the information that has been entered, which is standardized and geocoded.

Figure B6: Entity Creation via API - Validation, Standardization and Geocoding of New Record

This reporting interface component is built on an API and has been componentized for reuse across EPA programs, and in the last two years has been integrated into multiple reporting systems, such as the Toxic Release Inventory (TRI), TSCA Chemical Data Reporting (CDR), Compliance Emissions Data Reporting Interface (CEDRI) and others. Within the TRI program, they have seen significant data quality improvements and have estimated substantial burden reductions (as further described in the white paper).

Data Preparation

Prior to attempting matching, some basic exploratory data analysis is recommended to identify the types of data quality challenges noted in the main body of the white paper.

Data sets to be matched may be scattered across different systems, different architectures, and disparate tables, and that preprocessing may need to take place in order to extract the data for analysis, via Extract-Transform-Load (ETL) processes or in the case of loading to systems designed for big data analytics such as HDFS/MapReduce, Extract-Load-Transform as appropriate[61].

---

[61] Davenport, Robert J. (2008), "ETL vs. ELT: A Subjective View", Retrieved Sep 12 2016
http://www.dataacademy.com/files/ETL-vs-ELT-White-Paper.pdf

It should also be considered that within a data set, there may be substantial turnover of establishments (20% or more within some sectors over a 5-year timespan), via acquisitions, mergers, business startups and closures which can affect name matching; as such, timestamps and windowing within timeframes may be necessary.

Cleansing to Address Inconsistent Data Formats

In cleansing records for entity matching, some key processes include converting all characters to the same case, and removing special characters, extraneous punctuation and extraneous white space between words.

Stop word lists are often used to allow algorithms to ignore what may be extraneous noise within the corpus of entities to be matched, such as common words which may not add value like "The" or values that are often associated with establishments like "Inc." or "LLC." Preprocessing can aid in stripping out these types of stop words. Alternatively, one may look to algorithmically replace these values, mapping to standardized values, such as "Limited Liability Company" "LLC" "L.L.C." "L L C" standardized as "LLC."

In applying cleansing steps, care needs to be taken in terms of what order different processing steps are taken, along with replacement rules. For example, if stop-word lists result in the omitted word being treated as a space rather than null, it may result in failed matches.

Data Enrichment to Mitigate the Effects of Missing Fields

Toward entity resolution, it may be useful to generate derived attributes to assess data quality, identify potential data quality issues, and to standardize data fields for improved matching. This includes use of geocoding/reverse geocoding engines to generate standardized address fields and latitude/longitude values, along with spatial indexing or other processes for comparing locations to other geographies such as county polygons or jurisdictional boundaries.

Enrichment via geocoding can be a powerful tool to aid in entity matching, however it should be noted that modern geocoding algorithms still suffer from some limitations. As noted in the data elements section, address fields may include non-standard, descriptive types of values, particularly *relative values*, such as "35 miles north of Gunstock on Highway 17" or "Across from the Empire State Building." A geocoding algorithm would need to be sophisticated enough to be able to identify the features and relationships in the descriptive value. While progress continues to be made in this area, most current geocoding algorithms cannot handle these types of relative values. Geocoders can however typically handle references to street intersections.
Geocoders are most adept at handling *absolute values*, such as standard address types. As noted in the data collection section, geocoding engines incorporate algorithms for address parsing, normalization and standardization, for example parsing and standardizing "One South Riverton Avenue" as House Number: "1" Prefix Directional: "S" Street Name: "Riverton" Street Type: "Ave". It should however be noted that geocoders function optimally when input parameters have already been identified as discrete data elements, such as Address / City / State / ZIP. Geocoders also generate match values, returning values corresponding to whether a known match was made at the house number level, street level, street intersection, city or ZIP, providing varying degrees of confidence. Geocoding engines rely on external data sets for matching and comparison, such as Census TIGER data[62] and others, and as such will leverage these data sets to provide a latitude/longitude value, which is typically interpolated along a street segment, with the geocoding data set providing data on address ranges as shown in the figure below:

---

[62] "Census TIGER data", *US Census*, Retrieved Sep 12 2016
https://www.census.gov/geo/maps-data/data/tiger.html

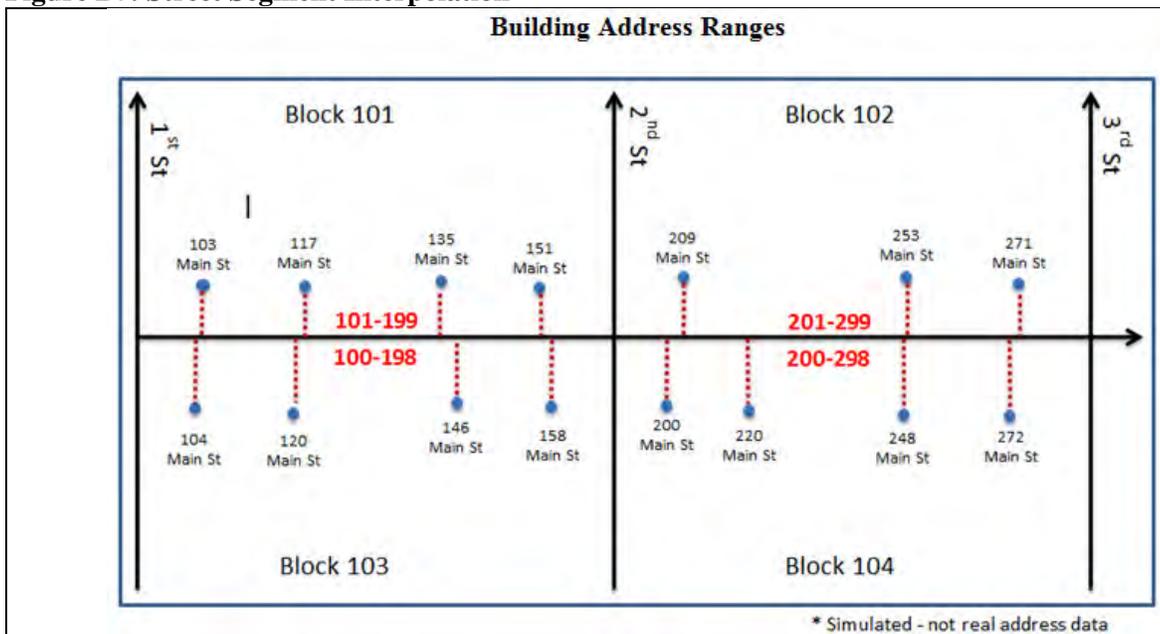
Figure B7: Street Segment Interpolation


Image source: US Census

Note that the interpolated value calculated will be directly on the street segment centerline. In order to provide a more realistic value, an offset may either be supplied as a default, or may need to be supplied as a parameter to the geocoding engine in order to provide a coordinate offset from the street centerline in the appropriate direction, based on even/odd address number. Some commercial providers such as HERE may also provide point addresses, which attempt to provide actual rooftop or parcel centroid coordinates for addresses. Where these types of match values are available, they will be displayed in the match results.

Geocoding engines can also typically perform *reverse geocoding*, which accepts a latitude/longitude value, and returns the closest matching street address. While caution should be exercised in using at the street address level, this capability can potentially be useful for enriching data which has incomplete or unreliable city/state/ZIP data.

Data to be matched can also be augmented via spatial indexing - this entails testing a location value against polygonal values[63], such as comparing entity latitude/longitude to a county polygon boundary. Spatial databases and GIS tools can provide this capability. Some useful geographies for analysis may include county polygons (note: it is more reliable to use county FIPS codes[64] rather than county names, as county names are

not unique) as well as other Census geographies such as Place[65] or Block[66] (as appropriate, and if other data elements reference these identifiers).

ALGORITHMIC MATCHING METHODS

Deterministic Methods:

The deterministic method is a process of data linkage that requires two records to agree on a pre-determined set of variables to conclude the pair as a link. A match is defined as records from two files that are truly the same unit. A link is defined as two records that are designated as the same unit based on their characteristics and decision rules. While matching on employer name or EIN may seem simple, great caution should be taken to ensure that the data elements from the matched sources are truly comparable and the resulting comparisons are meaningful.

The variables to be used are usually established by subject matter experts and require a significant amount of human review. Deterministic matching works best when there are unique IDs to match, or when there are reliable rules and high quality data elements that can be used for matching, such as email addresses, telephone numbers, dates of birth, NAICS or SIC codes - ideally with multiple elements used in combination - for example, a validated ZIP code by itself might not be sufficient for deterministic matching and would need to be combined with other data elements. It would also potentially be useful in deterministic processing to disambiguate from other similarly-named entities at different locations. Similarly, one could look at relationships within values such as related industrial classifications within NAICS or NAICS-SIC crosswalks[67].

In using deterministic approaches, consider business rules that may affect relationships between entities (for example, a common email or phone number that is at the HQ office but is shared across multiple entities, or one unique email address that shows up across 4,000 chain pharmacy locations).

Relationships between each individual establishment to the HQ office can be established but do not conflate individual entities. Also, as noted in the data elements discussion, consider that there may be third parties involved in the data submission process, such as consultants who are doing preparation on behalf of an establishment, as such, roles, wherever available should be considered. For example, the same law firm may prepare filings for many small companies and may be listed as the "contact person" and "contact mailing address" for all these employers. Linking on this field will create many erroneous links. The usefulness of company websites and Wikipedia pages in deterministic matching of parent companies with subsidiaries should not be understated.

In deterministic matching, it is much more efficient to have automated matching methods err on the side of matching too much, and having an analyst remove erroneous matches than vice-versa. It is much less time-consuming for an analyst to remove erroneous matches than to search out true matches.

Probabilistic Methods

Probabilistic methods are used to assign a score to two record pairs then set criteria determining link status. Many methods use three ranges of scores, a link with a high score, a non-link with a low score, and a possible link if the score falls in an indeterminate range. The possible links are then reviewed to determine match status.

In attempting to match across large data sets, blocking is an additional strategy that can be used when doing probabilistic record linkage in order to reduce the size of the comparison space. This strategy is used to group similar records before performing the comparison. For example, a full Cartesian join of two files with 450,000 records would yield over 200 billion comparison pairs. It can be seen as these data sets grow the number of comparison pairs can be computationally prohibitive or processing would take an unfeasible amount of time.

There are other strategies that can be used for the probabilistic matching such as standardizing names or fields prior to matching. In some cases edit distance measures can be used to rescale the component weights on a given field instead of giving a field a binary agree/disagree designation. Considerations also need to be made on how to handle missing data when using these methods. In some cases two missing fields should be considered a match while in others they should be non-deterministic or even a non-match. Other ways have been suggested to refine the *m-* and *u*-probabilities described previously using a frequency scaling such as the one described in *Matching and Record Linkage* by William Winkler[68].

Considerations and Clarifications in Probabilistic Entity Resolution Algorithms

1. **Entity Resolution** is not **Classification.** Simply identifying whether or not two records match or do not match is classification while entity resolution develops a dynamic entity using metadata.
2. **Entity Resolution** is not **Clustering.** The goal of clustering is to identify similar groupings of entities; the goal of entity resolution is to reconcile different iterations of the same entity down to their common iteration.

Algorithms for Comparing Latitude/Longitude

Comparisons of latitude/longitude pairs for proximity assume that coordinates contain valid values. Wherever possible, a prior data QA step should be taken to ensure that values pass reasonable checks. Common issues specific to entered lat/long values include reversal of lat/long values to long/lat, omission of sign for hemisphere, and use of placeholder values, such as 0,0 or 1,1. Additionally, data sets may use differing standards, such as sexagesimal degrees-minutes-seconds versus decimal degrees. These will need to be parsed and converted to decimal values. One way to perform a validation is to use a reverse geocoder on the address and compare the reverse geocoding result to the provided latitude/longitude value.
Haversine Distance: The Haversine Distance formula[69] can be used to compare spatial latitude/longitude tuples by computing Great Circle surface distance[70] between locations.

Text Matching Algorithms for Entity Resolution

The following methods address challenges related to missing important data fields, or having inconsistent data formats in text fields, such as name and address fields. Depending on which data element is being matched across data sets, different algorithms can be applied.

Objective	Description	Examples
String Matching	Quantify permutations needed to convert one string to another	Edit Distance, Alignment, Phonetic
Distance Metrics	Apply physical distance measures to abstract concept of data objects	Similarity, Text Analytics
Relational Matching	Conjunctive view reliant on one data object's relationship to other objects	Set Based, Aggregate

String Matching

String matching algorithms are concerned with whether or not two strings say the same thing. Outlined in the table below, there are four essential approaches. They may, however, be further subdivided into exact element-by-element character or phonetic comparison.

Boolean Matching, is easily understood as a Yes or No, 0 or 1, match or non-match between two strings. It is the most simplistic of the group and is the core logic on which the subsequent algorithms operate.

Method	Description	Examples
Edit Distance	Quantified permutations to convert one textual string into another	Levenshtein, Jaro-Winkler
Jaccard Coefficient	Ratio of existence or absence of one entity's individual attributes in another	Jaccard
Phonetic Similarity	Pronunciation of letters are phonetically related on a 0 to 1 similarity scale, aka, fuzzy matching	Soundex, Translation

In the heavily-studied **Edit Distance**, similarity is quantified by physically measuring the permutations needed to convert one string into other. The core implementation of edit distance is Levenshtein, which penalizes for insertions, deletions and substitutions. Over time Levenshtein has been modified with additional costs for gaps (Sellers), transpositions (Smith-Waterman), and affine gaps, i.e., weighted costs per each of the actions or the location of where the permutation must be made (Gotoh).

Jaro Distance is a hybrid version of edit distance whose more popular counterpart, Jaro-Winkler, is considered a hybrid algorithm. Practically, Jaro slides along two strings, comparing nGrams along the way to quantify the number of characters appearing in the same position and the number of transpositions required for coincident

characters which must be reordered in one string to match the other. Its best application is with short strings, also it disobeys triangle inequality.

The **Jaccard Coefficient** is an element-by-element measure of intersection. Stated otherwise, it is the ratio of the intersecting set to the union set. The Jaccard Coefficient satisfies triangle inequality. One frequently-confused issue: the similarity version of Jaccard and Tanimoto Coefficients are identical, but their dissimilarity coefficients diverge due to triangle inequality. While this justifies the need for two separate algorithms, they are frequently credited as the Jaccard-Tanimoto Coefficient as both mathematicians independently published this ratio unbeknownst of each other.

Phonetic Similarity algorithms result in Soundex encodings, which sidestep misspellings and variations, by indexing a table of language-specific homophones for a string's Soundex encoding rather than searching the string itself. Two critical inputs to phonetic similarity are (1) discerning which language the string is written in and (2) knowing the context of the letters you are matching. The crucial former prerequisite is accomplished by matching pronunciation rules of letter sequences using their location in the string ("sch" in German vs. "sz" in Polish at beginning of a string). The latter is accomplished by parsing the string into a sequence of phonetic tokens according to pronunciation rules in that language. The International Phonetic Alphabet (IPA) is popularly used to identify tokens with corresponding sounds, though frequently criticized for being too fine of match.

Distance Metrics

While string matching compares strings element-wise, distance metrics incorporate a spatial element, measuring the literal distance between two entities using algorithms seen in the table below. The first three are inter-related, easy visualized by plotting the entities to be reconciled on a preference space with x and y axes. A discerning eye anticipates the obvious limitation of these, that only a certain number of attributes is practical.

Method	Description	Examples
Euclidean	'As-the-crow-flies' distance	L_2-Norm, Ruler, Spearman
Mahalanobis	Matching for centered and standardized distances	
Manhattan	Distance if following a grid-like path, turning corners	L_1-Norm, Taxicab, City-Block, Footruler, Rectilinear
Minkowski	Generic edit distance, of which Euclidean, Manhattan and Chebyshev are instances	Soundex, Translation
Chebyshev	Distance along axis on which the objects show greatest absolute difference	L_{max}-Norm, Chessboard
Text Analytics		Pearson Coefficient, Jaccard Similarity Coefficient
Vector Similarity		Cosine Similarity, TFIDF

__Minkowski Distance__[71] is the generalized distance between two points in a plane. Specialized forms include Euclidean, Manhattan and the less-common Chebyshev.

Mathematically, *__Euclidean Distance__* is Minkowski Distance squared. Practically, it is the equivalent of the bishop in chess in that it moves diagonally, or as-the-crow-flies. The Euclidian Squared Distance Metric is a variation with quicker processing time since it does not take the square root.

---

[71] "Minkowski Space," *Wikipedia*, accessed Sep 12 2016
https://en.wikipedia.org/wiki/Minkowski_space

**Manhattan Distance** is mathematically the Minkowski Distance raised to 1; it is the same as Euclidean, except for the requirement of absolute value since it is not squared. Practically it is the equivalent of a knight, which makes L-shape moves. Its name is coined after the great borough of New York City, where pedestrians and cars must obey the laws of street corners.

Text Analytics

In contrast to the Minkowski distances, which scale similarity on a scale of 0 to 1, Pearson's Coefficient scales from –1 to 1, in other words fitting similarity along a line, making it a better choice for non-normalized data and when attributes' scales are undefined. Mathematically, it is the ratio between two points' covariance and standard deviation.

The _**Jaccard Similarity Coefficient**_ is mathematically the size, i.e., the existence of defined attributes using a binary 0/1, of the intersection of two points divided by the size of the union of the points.

Vector Similarity

First, a quick introduction to _**Vector Similarity**_. We construct a VSM (Vector Space Model) as a series of vectors quantifying frequency of a selected attribute inside a document. These vectors are subsequently assembled into a matrix, allowing easy algebraic manipulation. Two vector similarity functions are of particular note:

The widely-known bag of words model is enhanced to a 'bag of terms' with _**TF-IDF**_. Weighted TF-IDF incorporates local and global parameters, applying a logarithmic scale to account for a term's relative importance versus frequency of appearance. This allows the algorithm emphasize less-frequent terms' importance. TF-IDF normalizes any bias introduced into the vectors by keyword spanning, most commonly with the L2 (Euclidean) Norm. The equation is the row-wise multiple of two matrices: TF (Term Frequency, the local parameter): matrix of vectors of selected terms' frequencies of appearance in each document IDF (Inverse Document Frequency, the global parameter): diagonal matrix version of vector containing, for each term, the log of the number of documents divided by the number of documents in which the selected term appears

**Cosine Similarity** is most useful when it is known that two points have a high proportion of non-shared attributes. Mathematically, the attributes are presented in a vector, allowing the algorithm to find the dot product of the two points. It measures the angle of the vector rather than the magnitude. Theoretically this results in the angle between the two points' attributes; a 90° angle is perfect dissimilarity.

Relational Matching

Relational Matching algorithms retain many commonalities with Jaccard and Euclidean, but are mathematically differentiated since as a group they do not satisfy triangular inequality. Practically speaking, while the aforementioned algorithms measure similarity between two documents, relational algorithms broaden the playing field, incorporating a third document's attributes into the mix.

While the _**Tanimoto (Jaccard) Similarity Coefficient**_ is the same as the Jaccard Similarity Coefficient, the dissimilarity coefficient is where these two algorithms diverge. This is to say that Tanimoto is a proper similarity metric but its distance metric is not mathematically legal since it allows the two points to share commonality with a third point, causing it to disprove triangular inequality. In application, Tanimoto is preferred over Jaccard in cases when we want to allow the two points, themselves very different, to share commonalities with a third point. Mathematically, Tanimoto is the number of intersecting elements divided by the number of elements in either point.

**Dice's Coefficient** is mathematically the number of intersecting attributes divided into the total population of attributes, thus, as with Tanimoto, it shares a definition in its similarity metric version but Dice's dissimilarity

51

coefficient is not the same as it does not satisfy triangle equality. Compared to Markowski's, Dice's coefficient is sensitive to heterogeneity in data sets and less sensitive to outliers.

A simplistic similarity measure is ***Common Neighbors***, which predicts the likeness between two documents in terms of the number of common attributes each of those two documents independently shares with other documents.

Adamic/Adar Weighted modifies Common Neighbors to weight attributes that are shared infrequently relatively higher than those which are more common across all documents. Mathematically, this is accomplished by weighting a shared attribute's vector value with 1/ log of the number of times the attribute is shared across all documents.

Hybrid Metrics

Experts inevitably merge foundational seminal concepts together. Thus, this section explains some well executed hybrid metrics derived from the ones above.

Method	Description
Jaro-Winkler	Jaro Distance modified to favor common prefixes
Monge-Elkan	Atomic Strings matching with Gotoh
Soft-TFIDF	A forgiving version of Cosine & Monge-Elkan

Jaro-Winkler is a hybrid algorithm with its roots in Jaro Distance, edit distance, but incorporates Cosine Similarity's approach towards strings with high degree of dissimilarity and TF-IDF's concept of applying a weight to certain elements. It improves on the basic Jaro Distance by accommodating for strings with a common prefix, effectively biasing its matching to favor similarity between two otherwise-dissimilar strings who share a common prefix.

Monge-Elkan is sometimes considered synonymously with Smith-Waterman Edit Distance, but the two are differentiated as Monge-Elkan uses the Gotoh Distance. The confusion is understandable, as Gotoh amends Smith-Waterman distance by accommodating affine gaps. Practically, it applies the combined power of Levenshtein and Jaro Similarity Measures to n-Gram subsets of strings (called atomic strings). Mathematically, Monge-Elkan uses Gotoh edit distance to evaluate atomic strings against each other. Before deciding on Monge-Elkan you should understand how sensitive your matching is to the symmetry of your strings, i.e., if one string is longer than the other. It has quadratic time complexity due to its recursive calculations.

Soft-TFIDF adds a forgiveness factor to Cosine Similarity and Monge-Elkan, which are intolerant of spelling errors as they roll along atomic strings in the order of appearance by incorporating TF-IDF's concept of matrix of terms (i.e., letters) to develop an internal frequency per Atomic string. Soft-TFIDF calculates an inner score comparator, thus allowing partial matches.

Fellegi-Sunter Method and the Expectation-Maximization (EM) Algorithm

The Fellegi-Sunter is a common and well established method of probabilistic record linkage. This method is used to develop the scores for determining link status. The Fellegi-Sunter model sums the weights the log likelihood for each component to determine a match score. The log likelihoods are developed by taking the log of the ratio of the m- and u-probabilities. The m- probability is the probability of agreement on a field between two records that are a true match. The u-probability is the probability of agreement on a field between two records that are not a true match. The single component weight is $\log\left(\frac{m}{u}\right)$, if the field agrees and $\log\left(\frac{1-m}{1-u}\right)$, otherwise. The fields with more distinguishing power will have lower u-probabilities and therefore yield a large weight if the fields agree. There are a few different ways to estimate these probabilities. The u

probabilities can be estimated as a ratio of the frequency of the values divided by the number of pairs in the comparison space. The m probabilities can be estimated by taking samples of pairs and calculating a match rate based on human review or can be based on prior knowledge. A common method would be to use the EM algorithm to estimate both the m- and u-probabilities using the observed agreement patterns in the data. The EM algorithm starts with a sometimes arbitrary estimate of the m- and u-probabilities along with an estimate of the true match rate. The first step or expectation step is to use these initial parameters to estimate the probability of observing an agreement pattern among all the components given they are a true match for each record pair. Using these probabilities and the estimated match rate, the probability of a true match given the observed agreement pattern is calculated. Next the complete log-likelihood is separated into three maximization problems to solve for the new estimates of the m- and u- probabilities along with the true match rate. This process is repeated until some convergence criteria is met. See *Using the EM Algorithm for Weight Computation in the Fellegi-Sunter Model of Record Linkage*[72] by William Winkler to read this process is detail.
Naive Bayes Machine Learning: Naive Bayes Machine Learning methods have also been explored for entity resolution[73].

Ensemble Methods

In addition to many of the individual techniques described above, ensemble or composite approaches may help to enhance the quality of matching efforts. Given that many of the matching tasks are on text fields or text within fields, and string distance measures are often used to quantify the degrees of similarity and dissimilarity, leveraging the benefit of several measures may yield better results than relying on any one measure. Previous work (see Tejada et. al. 2001, Cohen and Richman 2002, and Bilenko and Mooney, 2002 in the supplemental bibliography) has empirically shown that compositing individual measures may offer better performance. A simple example of this method is provided with the code examples, and represents one of many possible approaches that could be taken in looking at finding establishments in data with a high degree of variability in how the establishment names and addresses are coded.

Evaluating Results of Matching and Entity Resolution Approaches

Cutoff Scores

When linking data, there could be an unfeasible amount of records that could be flagged for review given the size of the data sets being linked. Given consideration to the amount of resources that would be needed to review the links there are additional methods that reduce the amount of human review. Dusetzina, Tyree, Meyer, et al.[74] suggests a single cutoff developed by Cook[75] that uses a single cutoff which allows an acceptable distance between the starting weight and the desired weight. The acceptable distance is determined by the researcher's business need on the desired specificity and sensitivity. To increase the number of true matches at the cost of introducing more false positives the researcher would use a more liberal cutoff. If the

http://www.ncbi.nlm.nih.gov/books/NBK253313/pdf/Bookshelf_NBK253313.pdf

goal is to only keep record pairs with high probabilities of a match the researcher would set a more conservative cutoff at the risk of increasing false negatives.

Other considerations for cutoffs must be made on whether the matches should be one-to-one, one-to-many, or many-to-many. In the case of one-to-one matches the "greedy" strategy can be employed. The greedy strategy accepts the best match therefore it can only be used for one-to-one matching. This involves taking the pair that has the highest score for a given record. This can be employed without a cutoff if the assumption is a match exists for every record in a given file. In addition a combination of using the cutoff with the greedy method can be used when the assumption is a match may or may not exist and if it does there will only be one.

Performance Evaluation

A common problem with the probabilistic method is a way to evaluate the quality of the links. In most cases the sensitivity, specificity, positive predictive value and negative predictive value are analyzed. There are different ways to calculate these such as taking samples of the pairs and manual reviewing the pairs and characterizing them as true/false positive and true/false negative. However, this process is very resource intensive. Another option would be to use a training set to evaluate the method using known matches and non-matches but this scenario is usually not available.

Machine Learning in Evaluation

Another evaluation option would be to use a training set to evaluate the method using known matches and non-matches but this scenario is usually not available, however if a curated data set already exists, this may be an option.   A machine learning exercise can help in evaluating weighting and thresholds to be applied in tuning some of the other matching strategies, where a data set containing verified matches would be used to train the algorithm and then be used to analyze values returned by the match algorithms to aid in determining what combinations of algorithms are effective; what thresholds and tunings should be used for each algorithm; and weightings and approaches, whether hierarchical or otherwise should be used in using multiple algorithms in combination.

APPENDIX D: Workgroup Methodology

Drawing on strong interest among Federal agencies to achieve efficiencies in matching U.S. employer data across Federal data sets for data analysis, evaluations, and statistical activities, based on common needs across agencies, OMB convened the Employer Data Matching Workgroup in 2016 to complete the following tasks:

- Document pain-points related to matching and uniquely identifying establishments and firms within and between data sets and over time. For example, how are agencies classifying employers in their data and what terms are interchangeable across data sets (e.g., establishment level firm, or enterprise)? What challenges exist in the data for creating matches?
- Identify current successful strategies used by agencies to address this challenge in the context of analyzing data, conducting evaluations, producing statistics, and identifying where additional strategies may be needed to further facilitate this work. This process focuses on coming to agreement on one or a few methods that will be effective for multiple agencies.
- Along with OMB staff, work to develop a white paper identifying best practices, and high-level implementation steps, on how Federal agencies can achieve efficiencies in identifying and matching unique firms and establishments (and the relationship between the two) within and across Federal data sets, for the purposes of analyzing data, conducting evaluations, and producing statistics.

The Workgroup has representative and cross-functional mixture of:

- statistical agencies reporting data on employers,
- evaluation offices examining employers, and
- agencies with Federal programs affecting employers whose data are prime for research, evaluation, and data analysis.

See Table D1 for a complete list of participating offices and component agencies. OMB has also provided strong support for this work. The Social Security Administration's Office of Data Exchange also provided subject matter expertise to help inform the Workgroup's development of best practices.

Table D1: Employer Data Matching Workgroup, Participating Offices and Component Agencies

Department/Agency	Component Agency or Office
Department of Agriculture	Economic Research Service
Department of Commerce	Bureau of Economic Analysis
Department of Commerce	Census Bureau
Department of Commerce	Commerce Data Service
Department of Commerce	International Trade Administration
Department of Commerce	Minority Business Development Agency
Department of Commerce	National Oceanic and Atmospheric Administration
Department of Commerce	Office of the Secretary, Office of Performance, Evaluation, and Risk Management
Department of Education	Institute of Education Sciences, National Center for Education Statistics
Department of Health and Human Services	Agency for Healthcare Research and Quality
Department of Health and Human Services	Centers for Medicare and Medicaid Services, Center for Medicare & Medicaid Innovation
Department of Housing and Urban Development	Office of Policy Development and Research
Department of Labor	Bureau of Labor Statistics
Department of Labor	Chief Evaluation Office
Department of Labor	Employee Benefits Security Administration
Department of Labor	Occupational Safety and Health Administration
Department of Labor	Wage and Hour Division
Department of the Treasury	Internal Revenue Service, Statistics of Income Division
Department of the Treasury	Office of Financial Research
Department of the Treasury	Office of Tax Analysis
Department of Transportation	Chief Data Officer
Environmental Protection Agency	National Center for Environmental Economics
Environmental Protection Agency	Office of Environmental Information
Equal Employment Opportunity Commission	Office of Information Technology
Equal Employment Opportunity Commission	Program Research and Surveys Division
General Services Administration	Federal Acquisition Service
Securities and Exchange Commission	Division of Economic and Risk Analysis
Small Business Administration	Office of Performance Management

Figure D1 provides an overview of the Workgroup's approach. The Workgroup first prioritized agency pain points, and potential categories of best practices, to determine where to focus its efforts. Through this work, it became clear that there was consensus to review best practices for matching, and to review of long-term, high-value changes that agencies could implement to improve matching.

Given the unique scoping and makeup of the Workgroup, members recommended conducting a Workgroup-specific Data Inventory to get information on representative data sets (at a more detailed level than information provided through preexisting efforts, such as Data.gov), and a Workgroup-specific Methods Inventory to obtain information on representative methods for record linkage and entity resolution, to inform best practices.

- The Workgroup relied primarily on the Data Inventory to generate sections in the white paper related to long-term best practices. In August and September of 2016, Workgroup members provided information on a representative sample of data sets from their agencies contain information on individual employers, firms, and/or establishments that have the widest coverage, greatest use, or which they were most interested in matching to other data sets.
- The Workgroup relied primarily on its Methods Inventory to generate Best Practices for Matching and Data Collection Improvements. The Methods Inventory collected and disseminated best practices for matching. Specifically, the Workgroup asked for information on successful methods and tools agencies use for achieving efficiencies in matching employer, establishment or firm data.

The Workgroup then supplemented synthesized findings with iterative feedback from member agencies, a literature review, and an interagency clearance process. This approach was deemed analytically sufficient by the Workgroup's co-chairs, OMB, and Workgroup members.

Figure D1: Methodology

Determine Categories of Best Practices	
Pain Points Analysis	Prioritzation of Related Best Practices

Conduct Inventories to Inform Best Practices	
Data Inventory	Methods Inventory

Review of Literature to Round Out Best Practices	
Existing Standards	Methods

Come to Consensus Using Common Needs Across Agencies	
Refinements for Agency-Specific Issues	Finalize Common Taxonomy

The Data Inventory produced information on administrative and statistical data sources from a subset of participating Agencies, as shown in Table D2:

Table D2: Agencies and Offices Represented in Data Inventory

Department/Agency of Data Source	Component Agency or Office of Data Source
Department of Commerce	Bureau of Economic Analysis, Balance of Payments Division
Department of Commerce	Bureau of Economic Analysis, Direct Investment Division
Department of Commerce	Census Bureau
Department of Commerce	Census Bureau (Survey sponsored by the Agency for Healthcare Research and Quality)
Department of Education	Institute of Education Sciences, National Center for Education Statistics
Department of Education	Office for Civil Rights and National Center for Education Statistics
Department of Health and Human Services	Administration for Children and Families, Office of Child Support Enforcement
Department of Labor	Bureau of Labor Statistics, Office of Employment and Unemployment Statistics
Department of Labor	Employee Benefits Security Administration
Department of Labor	Occupational Safety & Health Administration
Department of Labor	Wage and Hour Division
Department of Transportation	Federal Aviation Administration
Department of Transportation	Federal Motor Carrier Safety Administration
Department of Transportation	Federal Railroad Administration
Department of Transportation	National Highway Traffic Safety Administration
Department of Transportation	Pipeline and Hazardous Materials Administration, Office of Hazmat Safety
Department of Treasury	Statistics of Income Division, Internal Revenue Service
Equal Employment Opportunity Commission	Program Research and Surveys Division, Office of Research, Information and Planning
General Services Administration	Integrated Award Environment
Securities and Exchange Commission	(Multiple Offices)
Small Business Administration	Office of Capital Access
Small Business Administration	Office of Disaster Assistance
Small Business Administration	Office of Entrepreneurial Development

72% of the data sources were administrative data sources and not subject to CIPSEA's requirements, but are, or could be, confidential under other statutes or policies; 28% of the data sources were from statistical agencies and subject to CIPSEA's requirements. Among the administrative data sources, the main unit of analysis is at the transactional level, and employers or firms referenced in these sources can be at either the establishment or

61

enterprise level. Among the statistical data sources, six (55%) were identified as at, or generally at, the establishment level; three (27%) were at the enterprise level; the remaining sources were at another type of level (e.g. government unit). The Workgroup examined commonalities among fields available in the example sources flagged from these agencies to develop common data elements. For example, approximately one-half of the sources in the inventory noted at least one identifier which could be used across agencies (e.g. EIN). Approximately one-half of the sources had an agency-specific identifier. As about half of the example sources included at least one interagency identifier, the Workgroup proceeded to include it in the Common Data Elements. 87% of the sources included physical and/or mailing addresses, and nearly all the sources included name fields.

As further described in Appendix A, the Workgroup also reviewed the Data Inventory for suggestions on potential authoritative sources, and considerations for reviewing legal barriers, policy and legal interpretations, and capacity and resource constraints.

To gather sufficient information to describe best practices in employer record linkage and entity resolution, the Workgroup conducted a methods inventory: a questionnaire that was sent to a broad spectrum of Federal agencies and offices in July 2016. Responses were obtained from 21 individuals representing 14 different Federal agencies or offices. The results are further detailed in Appendix B.

In order to round out the findings from the Data and Methods Inventories, the Workgroup also made note of relevant sources, and reviewed them in compiling best practices. These sources are listed in Appendix C.

Future work would include further refinement of best practices. Member agencies agreed that the approaches we capture are useful and agencies stand to gain from implementing them. There is however, an open question on how best to achieve the benefits of the best practices. A second phase of the work would focus on launching a methods community for matching employer data to develop refined methods by application, and further vetting of long-term best practices for consideration in future policy documents.

Appendix E: Best Practices Code Examples

Agencies submitted these code examples to support a better understanding of current methods and best practices, and illustrate approaches used in data remediation, canonicalization and data matching. This appendix provides the code samples in full so that individuals seeking to match data on employers can see the specific steps that are taken. Specifically:

- Code Example 1: Census SAS code to canonicalize/standardize string content to facilitate matching
- Code Example 2: Code from Census in SAS to demonstrate matching with Business Register (This code requires the SAS Data Quality Server)
- Code Example 3: Code from CEO/DOL to implement probabilistic matching, EM algorithm (This code does NOT require the SAS Data Quality Server)
- Code Example 4: Stata code from EBSA/DOL to remediate data quality issues and match data, using regular expressions
- Code Example 5: Code from OSHA/DOL to normalize/canonicalize/remediate data quality issues. This uses regular expressions, and makes use of information from some fields that code example 1 deletes.
- Code Example 6: Code from CEO/DOL to composite string distance measures
- Code Example 7: Code compiled by Rebecca Bilbro, in Python, to test string matching functions
- Code Example 8: Module used by the Office of Foreign Labor Certification (OFLC), ETA/DOL to remediate data quality issues

Note that many of the code examples that deal with data quality issues search for very specific patterns which can cause issues in both exact matching and inexact matching applications, as opposed to searching for generally unexpected or anomalous values. The exact code syntax is less important, rather the examples that warrant modification illustrate the kinds of actual agency data issues and problems that impede or limit the effectiveness of matching. The goal of these code sections is typically to standardize strings for comparison so that exact matching can occur, or to increase the accuracy and precision for inexact matching processes by reducing the rates of false positives and false negatives.

Code example 1: Census SAS code to canonicalize/standardize string content to facilitate matching

Code Example 6: Code from CEO/DOL to composite string distance measures
Code file in R, along with a sample data file, for evaluating the relative effectiveness and contrasts between common string distance measures. The code also demonstrates composite string distance measurement, and using high levels of similarity and dissimilarity to identify data quality issues. The code and data file can be found at the following address:
https://github.com/dullandboring/employer-data-matching

Code Example 7: Code compiled by Rebecca Bilbro, in Python, to test string matching functions
The following page contains a variety of tools and code examples to demonstrate and test different string distance measures. The resources include native capabilities in the base distribution, as well as DIFFLIB, FuzzyWuzzy, Jaccard and Jellyfish modules. The code for these varying examples, libraries and functions can be found at the following address:
https://github.com/DruidSmith/Python-Matching-Algorithms/blob/master/String%20Comparison.ipynb

Code Example 8: Module used by OFLC, ETA/DOL to remediate data quality issues
The following code is used by the ETA Office of Foreign Labor Certification (OFLC) to standardize string content in order to minimize the amount of manual de-duplicating required when trying to match or aggregate data.

```

Employer Data Matching Workgroup
Data Inventory

Department/ Agency or Office	Component Agency or Office	Dataset Name	Dataset Type: Owned by Data Inventory Respondent, or Desired by Data Inventory Respondent?	Data Update Frequency and Lags	Contact E-mail Address	Link to Data Collection Tool	Data.gov Link	Other Relevant Link(s)	Purpose of the Data Collection	Access Restrictions	Coverage	Unit of Analysis	Definition of "Company"	Corporate Structure and Relationships	Quality of Fields for Matching	Unique Identifier Fields	Name Fields	Address Fields	Country Fields	FIPS Code Fields	Industry Code Fields	Geocoding	Other Fields	Additional Notes
U.S. Department of Commerce	U.S. Census Bureau	Business Register	Owned	Continuously, update frequency varies by sources; lags vary by the reference period of the sources.		The Business Register is updated using information from several federal agencies, including the IRS, the Bureau of Labor Statistics (BLS), the Social Security Administration (SSA) and the Census Bureau. There are data collection tools linked to the sources. For example, the Company Organization Survey (COS), also known as the Report of Organization Survey, is an annual survey performed specifically for the purpose of maintaining BR information about multi-unit establishments' current organization and operating information. https://www.census.gov/econ/overview/mu0700.html http://www.reginfo.gov/public/do/PRAViewICR?ref_nbr=201502-0607-004	Not Applicable	www.census.gov/econ/overview/mu0600.html	To provide a current and comprehensive database of U.S. business establishments and companies for statistical program use.	The Business Register information is confidential (Title 13 and Title 26, US Code). Access is restricted to persons specially sworn to uphold the confidentiality provisions of Title 13 and Title 26.	Establishments of all domestic businesses (except agriculture, forestry, fishing, hunting, rail transportation, the U.S. Postal Service, elementary and secondary schools, colleges and universities, labor organizations, political organizations, religious organizations, public administration, and private households) and organizational units of multi-establishment businesses. The Business Register (BR) covers more than 160,000 multi-establishment companies, representing 1.8 million affiliated establishments, 5 million single establishment companies, and nearly 21 million non-employer businesses.	Establishment-based;	An establishment is a single physical location where business transactions take place and for which payroll and employment records are kept. Groups of one or more establishments under common ownership or control are enterprises. A single-unit enterprise owns or operates only one establishment. A multi-unit enterprise owns or operates two or more establishments.	Multi-unit enterprises may use multiple EINs, and they may use different ones when reporting to different federal agencies, complicating the matching process. The Census Bureau has linked many, but not all of the EINs to enterprises.	The Business Register is one of the most complete, current, and consistent source of establishment- based information about U.S. businesses, and is essential to assuring full coverage and high quality in Federal economic statistics programs. Examples of quality considerations for this source include: · The annual Company Organization Survey covers 30 percent of multi-unit companies and a small sample of firms that were single-unit firms in the most recent quinquennial Economic Census, so establishment openings and closings in the firms not covered may · The business register is divided into employer and non-employer business registers based on payroll employment. Some firms lease their employees from Professional Employer Organizations (PEOs) or use independent contractors. Such firms may appear in the non-employer business register despite having large revenues and many leased and/or contract employees. not be reflected in the business register until after the next Economic Census (though the Census Bureau takes measures to address this). (www.census.gov/econ/overview/mu06	A single-unit enterprise's primary identifier is its Employer Identification Number (EIN). A unique employer unit identification number identifies each establishment owned by a multi-unit enterprise on the Business Register. (https://www.census.gov/econ/susb/methodology.html)	Yes; Primary and secondary business names, permitting identification of both legal and trade designations for businesses that support them (e.g., franchises); character	Yes; Physical location, mailing address, post office (city or town) name, postal state abbreviation. ZIP+4; character	This field is not currently populated in the BR, but it may be possible to link in this information from the Company Organization Survey	Yes; County and State; character	6-digit NAICS codes; (https://www.census.gov/econ/susb/methodology.html)	Yes; latitude and longitude to six digits after the decimal; numeric	Census Tract (character), Census Block (character), 4-digit SIC codes (character)	Please also reference the working paper, "Documenting the Business Register and Related Economic Business Data" papers.ssrn.com/sol3/papers.cfm?abstract_id=2755723
U.S. Department of Labor	U.S. Bureau of Labor Statistics - Office of Employment and Unemployment Statistics (OEUS)	Quarterly Census of Employment and Wages (QCEW) Business Register (BR)	Owned	The QCEW BR is updated quarterly, and the data become available 6 months after the reference cycle.	QCEWinfo@bls.gov, BDMinfo@bls.gov	www.reginfo.gov/public/do/PRAViewICR?ref_nbr=1406-1220-001 www.reginfo.gov/public/do/PRAViewDocument?ref_nbr=201406-1220-001	catalog.data.gov/dataset/q uarterly-census-employment-and-wage-area	www.bls.gov/bdm, www.bls.gov/cew	To provide a quarterly census of all establishments under State unemployment insurance programs, representing about 98 percent of employment on nonfarm payrolls. This database of U.S. business establishments serves as the basis for multiple statistical programs; Sampling frame & benchmark(CES, JOLTS, PPI, OES, UALS, SOII, and NCS, which includes the ECI, EBS and ORS), labor market research, Business Employment Dynamics (BED) data.	All microdata are confidential subject to BLS non-disclosure standards.	Employment, wages, and administrative data (name, location, etc.) for over 9.5 million establishments covering approximately 98% of all employment.	Establishment-based	An economic unit that produces goods or services, usually at a single physical location, and engages in one or predominantly one activity. Potential lay synonyms: business, worksite, brick& mortar, site, storefront. Lay users my use "establishment" interchangeably with "firm" in the QCEW BR, however, there is a significant distinction between the two terms.	Multi-unit enterprises may use multiple EINs, and they may use different ones when reporting to different federal agencies, complicating the matching process. The dataset indicates whether an establishment is a single or multi-location establishment.	In order to ensure the highest possible quality of data from the QCEW program, BLS and the States verify and update, if necessary, the NAICS, location, and ownership classifications of all units on a 3-year cycle. Government units in public administration are not reviewed routinely.	EIN	Yes; Legal Name and Trade Name, character.	Yes; Physical location and mailing address;		Yes; County and State; character	6-digit NAICS codes;	Yes; latitude and longitude to six digits after the decimal; numeric		See also: www.bls.gov/opub/mlr/pdf/hom2h5.pdf
U.S. Department of Labor	Wage and Hour Division	Wage and Hour Investigative Support and Reporting Database (WHISARD)	Owned	Continuously; Not Applicable.	brown.brandon@dol.gov	Not Applicable.	catalog.data.gov/dataset/ wage-and-hour-division-compliance-action-data	ogesdw.dol.gov/views/dat a_catalogs.php	WHISARD is an automated data processing system that enables investigators, managers, and assistants in the Wage and Hour Division (WHD) to process complaints; assign and investigate cases; manage and close cases; assist with outreach; record and monitor investigator time; track case history through narratives and diary entries; process FOIA and publication requests; and report to management. (www.dol.gov/oasam/ocio/programs/Pi A/WHD/WHD-WHISARD.htm)	Publicly available data is available at: ogesdw.dol.gov/views/data_catalogs.ph p Otherwise, procedures are in place that must be followed before allowing users access to the system. The process is designed to comply with the principles of least privilege and separation of duties. (www.dol.gov/oasam/ocio/programs/Pi A/WHD/WHD-WHISARD.htm)	WHISARD contains WHD compliance actions. Publicly available data show all compliance actions from FY 2005 - onward.	Compliance action;	WHISARD includes data on employers, following the definitions of "employer" within the statutes administered and enforced by WHD. The WHD is responsible for administering and enforcing some of our nation's most comprehensive labor laws, including: the minimum wage, overtime, and child labor provisions of the Fair Labor Standards Act (FLSA); the Family and Medical Leave Act (FMLA); the Migrant and Seasonal Agricultural Worker Protection Act (MSPA); worker protections provided in several temporary visa programs; and the prevailing wage requirements of the Davis-Bacon Act (DBA) and the Service Contract Act (SCA).	WHISARD has limited functionality for corporate and industry structures. It is possible to infer linkages from other fields (for example, Trade Name, Legal Name, or EIN).	"…WHISARD has been improved as an information system…Quality control procedures have been introduced that improve the accuracy and reliability of key fields. The ability to run analyses for specific employers, industries, or geographic areas has been enhanced." (https://www.dol.gov/whd/resources/strategicenforcement.pdf)	EIN	Employer Trade Name; Employer Legal Name; character	Employer Street Address, City Name and State Abbreviation, Zip Code; character			NAICS Code; character			
U.S. Department of Commerce	U.S. Census Bureau	Longitudinal Employer Household Dynamics (LEHD)	Owned	Updated quarterly.	CES.Local.Employment.Dyna mics@census.gov	See QCEW entry.	catalog.data.gov/dataset/l ehd-origin-destination-employment-statistics-lodes www2.census.gov/ces/wp/ 2014/CES-WP-14-26.pdf	www.census.gov/ces/data products/lehddata.html www2.census.gov/ces/wp/	The purpose is to provide high quality local labor market information and to improve the Census Bureau's economic and demographic data programs.	The data are confidential (Title 13 and Title 26, US Code). Access is restricted to persons specially sworn to uphold the confidentiality provisions of Title 13 and Title 26.	Employment, wages, and administrative data (name, location, etc.) for over 9.5 million establishments covering approximately 98% of all employment.	Job-level (worker-firm combinations)	An economic unit that produces goods or services, usually at a single physical location, and engages in one or predominantly one activity. Potential lay synonyms: business, worksite, brick& mortar, site, storefront. Lay users my use "establishment" interchangeably with "firm" in the QCEW, however, there is a significant distinction between the two terms.	The data are reported at the firm-state level and for reporting units (establishments) of the firm-state. The data have been linked to the Census Business Register to attach a firm identification number, firm age, and firm size.	The worker-level LEHD data are the earnings records used for the administration of the Unemployment Insurance program. The LEHD establishment-level data are downstream of the Quarterly Census of Employment and Wages. In addition to benefitting from the data quality monitoring and improvements made by these upstream programs, the LEHD program also maintains a data quality staff to ensure the quality of the microdata.	Firm identifier is state employer identification number (SEIN), reporting unit ("establishment") identifier is SEINUNIT id.	Legal Name and Trade Name, character.	Yes; Physical location and mailing address of establishments		Yes; County and State; character	6-digit NAICS codes;	Yes; latitude and longitude to six digits after the decimal; numeric	Census Tract (character), Census Block (character), 4-digit SIC codes (character)	See also: lehd.ces.census.gov/
Equal Employment Opportunity Commission	Surveys Division	EEO-1	Desired	Annually	benita.marsh@eeoc.gov	www.eeoc.gov/employers/ eeo1survey/index.cfm	www.eeoc.gov/employers/ eeo1survey/2007instructio ns.cfm www.eeoc.gov/employers/ eeo1survey/upload/eeo1-2 2.pdf		The EEO-1 Report is a compliance survey mandated by federal statute and regulations. The survey requires company employment data to be categorized by race/ethnicity, gender and job category. The EEO-1 Report is used by the EEO-1 Joint Reporting Committee comprised of the Equal Employment Opportunity Commission (EEOC) and the Department of Labor's Office of Federal Contract Compliance Programs (OFCCP) to collect data from private employers and government contractors about their women and minority workforce. The agencies also use the EEO-1 Report data to support civil rights enforcement and to analyze employment patterns, such as the representation of women and minorities within companies, industries or regions.	All reports and information from individual reports will be kept confidential, as required by Section 709(e) of Title VII of the Civil Rights Act of 1964. 42 U.S.C. 2000e-8(e). Only data aggregating information by industry or area, in such a way as not to reveal any particular employers statistics, will be made public.	All Private employers who are (1) subject to Title VII of the Civil Rights Act of 1964, as amended with 100 or more employees, or (2) private employers subject to Title VII who have fewer than 100 employees if the company is owned or affiliated with another company, or there is centralized ownership, control or management (such as central control of personnel policies and labor relations) so that the group legally constitutes a single enterprise, and the entire enterprise employs a total of 100 or more employees. All federal contractors (private employers), who (1) are not exempt as provided for by 41 C.F.R. § 60-1.5; (2) have fifty or more employees and (a) have a federal contract or first-tier subcontract worth $50,000 or more, or (b) act as depositories of federal funds in any amount, or (c) act as issuing and paying agents for U.S. savings bonds and notes. Single-establishment employers submit only one EEO-1 report, while employers whose business was conducted at more than one location submitted a company-wide consolidated report, a headquarters report, and individual reports for each establishment with fifty or more employees.	At the firm level for all covered firms. Also at the establishment level for establishments with at least 50 employees.	"Employer" under Section 701(b), Title VII of the Civil Rights Act of 1964, as amended, means a person engaged in an industry affecting commerce who has fifteen or more employees for each working day in each of twenty or more calendar weeks in the current or preceding calendar year, and any agent of such a person, but such term does not include the United States, a corporation wholly owned by the government of the United States, an Indian tribe, or any department or agency of the District of Columbia subject by statute to procedures of the competitive service (as defined in section 2102 of Title 5 of the United States Code), or a bona fide private membership club (other than a labor organization) which is exempt from taxation under Section 501(c) of the Internal Revenue Code of 1954; OR any person or entity subject to Executive Order 11246 who is a federal government prime contractor or subcontractor at any tier (including a bank or other establishment serving as a depository of federal government funds, or an issuing and paying agent of U.S. Savings Bonds and Notes, or a holder of a federal government bill of lading) or a federally-assisted construction prime contractor or subcontractor at any tier.	Multi-establishment employers, i.e., employers doing business at more than one establishment, must complete online: (1) a report covering the principal or headquarters office; (2) a separate report for each establishment employing 50 or more persons; and (3) a separate report (Type 8 record) for each establishment employing fewer than 50 employees, OR an Establishment List (Type 6 record), showing the name, address, and total employment for each establishment employing fewer than 50 persons, including a Type 6 employment report for all establishments working at establishments employing fewer than 50 employees by race, sex, and job category. For the EEO-1 online application, keyed employment data automatically transfers to the overall Consolidated Report. The total number of employees indicated on the headquarters report, PLUS the establishment reports, PLUS the list of establishments employing fewer than 50 employees, MUST equal the total number of employees shown on the Consolidated Report.	EIN. Government contractors are also asked to provide their DUNS number.	Parent company name, establishment name.	Yes; number and street address, city, state, and zip code for parent company and establishment. Also county for establishment.	No.		Verbal description of major activity of the establishment.		Employment definition includes leased employees, unlike the Census Business Register.
Securities and Exchange Commission	Integrated Award Environment	SEC Company Filings	Desired	Continuously, daily updates		www.sec.gov/info/edgar.s html		www.sec.gov/dera/data/fi nancial-statement-data-sets.html www.sec.gov/edgar/search help/edgarfulltextfrequentlyaskedquestions.htm www.sec.gov/edgar/search tools.htm	EDGAR, the Electronic Data Gathering, Analysis, and Retrieval system, performs automated collection, validation, indexing, acceptance, and forwarding of submissions by companies and others who are required by law to file forms with the U.S. Securities and Exchange Commission (SEC). Its primary purpose is to increase the efficiency and fairness of the securities market for the benefit of investors, corporations, and the economy by accelerating the receipt, acceptance, dissemination, and analysis of time-sensitive corporate information filed with the agency.	Publicly available through EDGAR.	All public companies must file. Private companies also make filings when issuing unregistered securities.					EIN, CIK	Business name	Business and mailing addresses. U.S. Department of Commerce	U.S. Census Bureau	Governments Intergrated Directory(GID): A migration from the GID to the Governments Master Address File (GMAF) is planned for October 2017.	Owned	The GID universe is updated continuously, although a formal and comprehensive update occurs once every five years during the Census of Governments. There are also annual surveys, including the Boundary and Annexation Survey, the Annual Finance Survey and the Annual Survey of Personnel and Payroll, which provide periodic updates. From the annual survey's collection period, the data are reviewed and edited as necessary, and the GID universe is updated 1.5-2 years following initial collection cycle.	eizmd.gus.pclt3@census.gov	www.census.gov/govs/cog/	N/A	www.meps.ahrq.gov for published statistics from this dataset	In order to measure government activity, various surveys collect statistics for state and local governments and their dependent agencies. A complete list of local governments is needed to sample for these surveys. This list of governments is found in the Governments Integrated Directory (GID).	Public Sector Statistics are considered public information, which is available online through AFF. We also provide additional statistics, not available in our publications, upon data user request in the form of a Special Tabulation File.	The GID includes all governments in the United States, along with their dependent agencies. This includes all states and dependent agencies, counties and dependent agencies, cities, towns and townships, municipalities, special districts, authorities, boards and commissions.	Government Unit	A governmental units is defined as an organized entity which, in addition to having governmental character, has sufficient discretion in the management of its own affairs to distinguish it as separate from the administrative structure of any other governmental unit. An entity must possess all three of the critical attributes to be regarded as a government: Existence as an Organized Entity, Governmental Character, and Substantial Autonomy.	Both parent and dependent agencies as well as independent agencies.		Each unit has a 14 digit GID ID: SS T CCC UUU SUP SB where: SS = State. Numeric sequence assigned to the states alphabetically – Alabama is 01, Alaska 02, and so forth, until Wyoming at 51. Note the District of Columbia is assigned code 09 and the U.S. Federal Government is assigned code 00. T = type of government. As defined by the Census Bureau. Government type codes are 0 = state governments 1 = county governments 2 = municipal governments 3 = township governments 4 = special district governments 5 = school district governments 6 = Federal Government CCC = county area within the state. The county area codes, are assigned alphabetically within each state area, although there are some exceptions where county consolidations have taken place or new counties have been created. UUU = unit code within the county area. The unit code identifies a specific government within the state, county, and type of government sequence. They, too, are generally alphabetical within the county area and type of government combination, but exceptions exist (especially for special districts). The unit code for a county government is usually the same as its county area code. SUP = supplemental unit code, for dependent agencies of the parent unit. The supplemental code identifies different dependent agencies of the same parent state or local government. Every supplement must have a parent government. The first nine digits of a supplement and parent code always are the same. SB = subsidiary code for dependent agencies that require separate data collection / canvassing. The subsidiary code is used for component units of dependent agencies that require a separate data collection. A good example is found in state dependent university systems, where separate campuses exist for a dependent university, each campus having its own subsidiary code.	Yes - complete governmental unit name	Yes physical location and mailing address	N/A	N/A	N/A	No		Although this information is specific to the current GID, most of the information also applies to the GMAF with the exception of the ID format.

U.S. Census Bureau	Sponsored by the Agency for Healthcare Research and Quality	Medical Expenditure Panel Survey- Insurance Component - Private Sector Employer Sample	Owned	Fielded annually.	Karen.Davis@ahrq.hhs.gov	www.meps.ahrq.gov has information on survey questionnaires and methodology reports.	N/A	www.meps.ahrq.gov for published statistics from this dataset	To collect information about employer sponsored health insurance. The MEPS-IC collects information on whether an employer offers coverage, details of plans and information on establishment and workforce characteristics. For the private-sector sample, information is collected on up to 4 plans that are offered to active employees.	The Business Register information is confidential [Title 13 and Title 26, US Code]. Access is restricted to persons specially sworn to uphold the confidentiality provisions of Title 13 and Title 26. Micro-data can be used at a Census Research Data Center.	A sample drawn from the Business Register of approximately 40,000 establishments each year.	Private-sector establishments	An establishment is a single physical location where business transactions take place and for which payroll and employment records are kept. Groups of one or more establishments under common ownership or control are enterprises. A single-unit enterprise owns or operates only one establishment. A multi-unit enterprise owns or operates two or more establishments. The treatment of establishments on the Business Register differs according to whether the establishment is part of a single-unit or multi-unit enterprise. (https://www.census.gov/econ/susb/me thodology.html)	Multi-unit enterprises may use multiple EINs, and they may use different ones when reporting to different federal agencies, complicating the matching process. The Census Bureau has linked many, but not all of the EINs to enterprises.	The Business Register provides the most complete, current, and consistent source of establishment -based information about U.S. businesses, and is essential to assuring full coverage and high quality in Federal economic statistics programs. Examples of quality considerations for this source include: · The annual Company Organization Survey covers 30 percent of multi-unit companies and a small sample of firms that were single-unit firms in the most recent quinquennial Economic Census, so establishment openings and closings in firms not covered may not be reflected in the business register until after the next Economic Census. · The business register is divided into employer and nonemployer business registers based on payroll employment. Some firms lease their employees from Professional Employer Organizations (PEOs) or use independent contractors. Such firms may appear in the nonemployer business register despite having large revenues and many leased and/or contract employees. www.census.gov/econ/overview/mu060 0.html)	A single-unit enterprise's primary name, permitting identification of both legal and trade designations for businesses that support them (e.g., franchises); character	Yes, Primary and secondary business names, permitting identification of both legal and trade designations for businesses that support them (e.g., franchises); character	Yes: Physical location, mailing address, post office (city or town) name, postal state abbreviation; ZIP+4; character	This field is not currently populated in the BR, but it may be possible to link in this information from the Company Organization Survey	Yes; County and State; character	6 digit NAICS codes	Yes, latitude and longitude to six digits after the decimal; numeric	Census Tract (character), Census Block (character), 4-digit SIC codes (character)	
U.S. Department of Education	National Center for Education Statistics	Common Core of Data (CCD)	Owned	Annual Collection. Client (entrepreneur or small business owner) level data is available for all those who have sought services from an OED Resource Partner or online Learning Center course. There are approximately 1 M records annually across all programs.	Client (clients may or may not own a business)	The client self-identifies if they have an active business	N/A	There is no client level PII in the system	None	Client names are not required	Client address is not required	Not required	No	Industry Category (not NAICS)	No	No	N/A
U.S. Department of Commerce	US Census Bureau	Survey of Business Owners	Owned	Annually	ewd.survey.of.business.owners@census.gov	www.census.gov/programs-surveys/sbo/technical-documentation/questionnaires.html		www.census.gov/econ/overview/mu0300.html	The Survey of Business Owners (SBO) provides the only comprehensive, regularly collected source of information on selected economic and demographic characteristics for businesses and business owners by gender, ethnicity, race, and veteran status.	The data are confidential (Title 13 and Title 26, US Code). Access is restricted to persons specially sworn to uphold the confidentiality provisions of Title 13 and Title 26.	Included are all nonfarm businesses filing Internal Revenue Service tax forms as individual proprietorships, partnerships, or any type of corporation, and with receipts of $1,000 or more. The SBO covers both firms with paid employees and firms with no paid employees. The SBO is conducted on a company or firm basis rather than an establishment basis. A company or firm is a business consisting of one or more domestic establishments that the reporting firm specified under its ownership or control.	Firm, usually single unit	A firm is a business organization or entity consisting of one domestic establishment (location) or more under common ownership or control. All establishments are included as part of the owning or controlling firm. For the economic census, the terms "firm" and "company" are synonymous.	NA	Outside data must first be matched to the Business Register and then linked to the SBO using the BR's business identifiers.	Internal Census identifiers such as the LBDNUM	NA (available through Business Register link)	NA (available through Business Register link)		Yes; County and State, character	6-digit NAICS	NA (available through Business Register link)		
U.S. Census Bureau	US Census Bureau	Longitudinal Business Database	Owned	Annually	ces.contacts@census.gov	The LBD is built by linking consecutive years of the Census Bureau's Business Register		www.census.gov/ces/dataproducts/datasets/lbd.html		The Business Register information is confidential (Title 13 and Title 26, US Code). Access is restricted to persons specially sworn to uphold the confidentiality provisions of Title 13 and Title 26.	The data are compiled by combining data	Establishment based;	An establishment is a single physical location where business transactions take place and for which payroll and employment records are kept. Groups of one or more establishments under common ownership or control are enterprises. A single-unit enterprise owns or operates only one establishment. A multi-unit enterprise owns or operates two or more establishments.	Multi-unit enterprises may use multiple EINs, and they may use different ones when reporting to different federal agencies, complicating the matching process. The Census Bureau has linked many, but not all of the EINs to enterprises.	Outside data must first be matched to the Business Register and then linked to the LBD using the BR's business identifiers.	A Census-constructed "LBDNUM" field links establishments over time.	NA	NA	NA	Yes, county, state FIPS, character.	6-digit NAICS codes;	Yes; latitude and longitude to six digits after the decimal; numeric

The Internal Revenue Service (IRS), Department of Labor (DOL), and Pension Benefit Guaranty Corporation (PBGC) have consolidated certain returns and report forms to reduce the filing burden for plan administrators and employers. Employers and administrators who comply with the instructions for the Form 5500 generally will satisfy the annual reporting requirements for the IRS, and DOL, and PBGC.	The data sets are shared by IRS, PBGC, and DOL. Some data containing Personal Identifying information (such as SSN) will not be available.	Over 700,000 Pension and Welfare filings for a given plan year. Specific plan information are attached (participant, asset, etc.). A return/report must be filed every year for every pension benefit plan, welfare benefit plan, and for every entity that files as a DFE as specified below (pursuant to Code section 6058 and ERISA sections 104 and 4065).	Plan based unit of analysis	Usually based on entire firm, not on a single establishment. Firms will be reported in data base as plan sponsors or plan service providers.	Sponsor to benefit plan(s) structure. Same sponsor may provide multiple plans. Each company may be represented in various plans. (If any connection can be identified, it's usually through the EIN)	Name fields are not very dependable. Numerous different names can be spelled, shortened, etc for 1 given plan or sponsor. Ack_ID and EIN fields are primarily used. Other variables such as participant, asset, and plan characteristic fields are used to ensure quality. Various edit checks are performed to ensure no duplicate filings are tabulated.	EIN; Ack_ID	Yes; Plan name, Sponsor name, Plan administrator name.	Yes, all are simple mailing addresses and not where the plans are established; Sponsor mailing address and Plan administrator mailing address;	Theoretically, the data can contain non-US address. If outside US, enter the foreign routing code, if applicable. Leave U.S.state and zip code blank if entering a foreign routing code and country name.	No	No	6-digit NAICS codes;	No	Possibly match name fields and EINs to other sources. Not sure about the resulting quality.	Page 35 from the following pdf has data variables: www.dol.gov/agencies/ebsa/researchers /data/retirement/pension-user-guide-2013.pdf
U.S. Department of Treasury	Internal Revenue Service - Statistics of Income	Business Master File	Owned	Data are updated continuously; Data becomes available weekly.	sis@irs.gov	Not applicable	Data.gov doesn't host any of our data, it just points at our pages on IRS.gov. As far as us pointing out to Data.gov, there's only a couple places where we direct users out to the Data.gov site through Tax Stats on IRS.gov.	www.irs.gov/uac/tax-stats	IRS: The purpose of data collection is mainly for determining Federal tax liability for businesses required to file. SOI: The data are used to produce statistics on income, deductions, credits and other taxes, as reported by businesses. The current design is a probability sample stratified by Business type (as indicated by the IRS form filed) and either by size of total assets alone or size of total assets and a measure of income.	Federal Tax Information (FTI) is confidential [Title 26, US Code] and shared with other government agencies under IRC 6103(j) provisions.	IRS: All Federal business tax returns that meet IRS filing requirements. SOI: Selected active Federal business tax returns based on SOI's sample design.	Tax Return.	Definition of "company" is based on Title 26 requirement.	The dataset consists of individually filed returns which can represent: corporations (a single establishment; subsidiary establishment or consolidated filed returns representing a group of establishments); partnerships and other pass-through entities; or sole proprietorships.	Most matching is accomplished using the EINs provided by entities as reported on Federal tax returns. SOI uses exact matching with EINs and data processing begins with information already extracted for IRS administrative purposes. SOI performs limited internal "data cleaning" for statistical purposes. This includes organizing data to make it structurally consistent, coding data items to make them analytically useful, and validating values to ensure mathematical consistency. Contact information is validated as part of routine administrative processing of returns at the time they are received by the IRS.	Employer Identification Number (EIN)	Yes; Parent Company Name	Yes; Tax Filing Address, City, State Abbreviation, Zip Code	-	-	6-digit NAICS codes		-	The focal point of the answers provided is based on data collection for Statistics of Income (SOI) unless otherwise noted.

From Data to Evidence to Policy

Recommendations for the Commission on Evidence-Based Policymaking

MAY, 2016

The William T. Grant Foundation

The William T. Grant Foundation supports research to improve the lives of young people ages 5–25 in the United States. Our goal is to accumulate a body of knowledge that will advance theory, policy, and practice and contribute to improved outcomes and opportunities for youth, today and in the future. In 2014, we launched an initiative to invest in research to identify effective responses to inequality in its many forms. And since 2009, we have supported studies that provide insight into how policymakers, administrators, and service providers acquire, interpret, and use research evidence. In 2015, we signaled a new direction in this initiative, calling for studies that identify, create, and test strategies to improve the use of research evidence in ways that benefit youth.

The Forum for Youth Investment

The Forum for Youth Investment is a nonprofit, nonpartisan "action tank" dedicated to helping communities and the nation make sure all young people are Ready by 21®: ready for college, work and life. A trusted resource for policy makers, advocates, researchers and program professionals, the Forum provides youth and adult leaders with the information, connections and tools they need to create greater opportunities and outcomes for young people. The Forum manages a number of centers and projects, including Big Picture Approach Consulting, the David P. Weikart Center for Youth Program Quality, the Children's Cabinet Network and SparkAction. The core work of the Forum is helping leaders, organizations, partnerships and systems – at the local, state and national levels – assess, improve and align their practices and policies.

From Data to Evidence to Policy
Recommendations for the Commission on Evidence-Based Policymaking

The Forum for Youth Investment and the William T. Grant Foundation are pleased to submit the following recommendations to the Commission on Evidence-Based Policymaking. We are encouraged by the Commission's potential to promote the use of research evidence in policymaking, and we offer these insights with the hope of helping the Commission make the most of its historic opportunity.

These suggestions are drawn from our experience as conveners of a learning group of senior career staff and appointees in research offices focused on children, youth, and families within the U.S. Departments of Education, Labor, Justice, and Health and Human Services, as well as in the Corporation for National and Community Service and the National Science Foundation. These agencies invest in research and evaluation to build policy-relevant evidence and will likely be charged with implementing many of the Commission's recommendations. They also have experience responding to similar challenges in the past. For these reasons, their insights may guide the Commission in developing a transformational set of recommendations.

The Path from Data to Evidence to Policy

A narrow interpretation of the Commission on Evidence-Based Policymaking legislation might suggest the Commission's charge is primarily to determine how the federal government can share and link administrative data sets. Accomplishing this aim would be of significant value. But a broader interpretation of its charge suggests that the Commission must not stop there. It should also consider *how the federal government can use data to create the evidence required for smart policy decisions,* as well as *how to create the infrastructure to support the use of evidence in policymaking*.

We urge the Commission to prioritize those elements of its charge that point toward these broader aims:

- Emphasize how data "may be integrated and made available to facilitate program evaluation, continuous improvement, policy-relevant research, and cost-benefit analyses by qualified researchers and institutions;" and
- Examine "how data and results of research can be used to inform program administrators and policymakers to improve program design."

Sharing and linking data is necessary but not sufficient to achieve these goals. The data must be deployed in research and evaluation to create evidence, which must be then be used to inform policymaking. Laying the groundwork for the path from data to evidence to policy is essential to the Commission's charge.

Sharing and Linking Data → Using Data to Create Evidence → Using Evidence to Inform Policymaking

Sharing and Linking Data

The Commission should recommend that data are collected and shared in ways that facilitate their use in research and evaluation.

Sharing data is a valuable first step. But the data take on added power when they can be used in research and evaluation studies. The Commission can fulfill its charge of addressing "how data and results can be used to inform program administrators and policymakers" by recommending ways that administrative data systems can be made ready for use in research and evaluation. The Commission could craft recommendations that would help ensure that data are linked; are of sufficient quality; and are delivered in formats that encourage their use in research that answers policymakers' questions.

Linking separate data sets together increases the value of each for research and evaluation. One federal staff member in our learning group commented, "I am working on linking existing databases to conduct research. I need to figure out what kinds of data are being collected….Who is tracking relevant outcomes, and how do you synthesize that with community-level data from multiple sources to tell the impact of interventions across multiple domains?"

Linking existing data can also enable faster and cheaper research studies. As one participant reported, "There has been a lot of thinking overall in our department on the opportunities these longitudinal data systems have for low cost evaluations. A whole group of people in our program offices are focused on this right now." But using data that are not designed for research can be challenging. Sometimes the quality of the data is poor or unknown. As a learning group participant put it, "It is not easy to figure out if a given set of administrative data is high-quality enough to be used in a research context."

Sometimes the ways that the data are shared make it difficult to produce useful research reports. As one learning group participant shared, "Only one or two people in each of our agencies know how to manipulate specific databases, and those people have a long list of requests from multiple agencies to do specific data runs. We are hoping that we can take on the burden of getting the data ready. A lot of the data we have, like those that manage case files, were not created to be used for research, so that is a heavier lift. We want to give agencies a more realistic view of the data they actually have."

Using Data to Create Evidence

The Commission should recommend that federal agencies adopt a broad and inclusive view of the types of research studies that can and should be produced with administrative data.

The power of data increases when they are used to create **research evidence** (see sidebar). Too often, however, a narrow conceptualization of data *as* evidence limits the ability of policymakers to gain full understanding of an issue. The Commission could add value to the field by advancing a framework that delineates the types of research evidence that should be created to guide policymaking.

DEFINITION OF RESEARCH EVIDENCE

The William T. Grant Foundation defines research evidence as "a type of evidence derived from applying systematic methods and analyses to address a predefined question or hypothesis. This includes descriptive studies, intervention or evaluation studies, meta-analyses, and cost-effectiveness studies conducted within or outside research organizations."

The Commission may wish to reinforce frameworks such as the Institute of Education Sciences/National Science Foundation's *Common Guidelines for Education Research Development* framework[1] and the Health and Human Services Administration for Children and Families' *Common Framework for Research & Evaluation.*[2] Adopting these types of frameworks would help ensure that policymakers not only receive findings from the full range of types of research evidence, but review this evidence with a clear understanding of the level of rigor and quality inherent in each type of study, and what types of questions are answerable by each respective research methodology.[3]

Using Evidence to Inform Policymaking

The Commission should recommend that federal agencies support partnerships between researchers and policymakers that inform key research questions and facilitate the use of research evidence.
Partnerships between researchers and policymakers can improve the use of research evidence by guiding researchers to ask questions that respond to the needs of policymakers, building stronger practice-focused research networks or community-based participatory approaches, and creating a culture of learning in which administrators, policymakers and other government leaders include research evidence in their deliberations.

The growing literature about how and when research evidence is and is not used in policymaking can inform the Commission's work. These studies "complicate the common conception of research users as merely rational actors who have questions, go in search of research to answer them, and then apply it to their decisions…. In none of their cases does research use easily boil down to a single moment or an isolated decision….It is not a simple process whereby research 'facts' are passed from researchers to research users and then applied in a linear decision making process. Instead, research use is contingent, interactive, and iterative. It involves people individually and collectively engaging with research over time, bringing their own and their organization's goals, motivations, routines, and political contexts with them."[4] It is often helpful to construct evidence in a process of engagement, in which the needs of decision makers help shape research questions and findings are delivered in an accessible and timely fashion through relationships of trust and mutual understanding.

The Commission should recommend ways to strengthen the federal infrastructure for producing research evidence that can inform policymaking.
To address its charge to examine how data may be "made available to facilitate program evaluation, continuous improvement, policy-relevant research, and cost-benefit analyses by qualified researchers and institutions," it is important for the Commission to create recommendations for strengthening the federal infrastructure for using data to create evidence, and using that evidence to inform policymaking.

---

[1] Available at: http://www.nsf.gov/pubs/2013/nsf13126/nsf13126.pdf
[2] Available at: http://www.acf.hhs.gov/programs/opre/resource/the-administration-for-children-families-common-framework-for-research-and-evaluation
[3] While there may not yet be widely accepted quality standards for the all types of research, some of our learning group members pointed to the following article as a promising start: Gottfredson, D. C., Cook, T. D., Gardner, F. E. M., Gorman-Smith, D., Howe, G. W., Sandler, I. N., & and Zafft, K. M. (2015). Standards of evidence for efficacy, effectiveness, and scale-up research in prevention science: Next generation. *Prevention Science*, *16*, 893-926.
[4] Tseng, V. & Nutley, S. (2014). Building the Infrastructure to Improve the Use and Usefulness of Research in Education. In K.S. Finnigan & A.J. Daly (Eds.). *Using Research Evidence in Education: From the Schoolhouse Door to Capitol Hill*. Springer: New York. Available at: http://wtgrantfoundation.org/resource/building-the-infrastructure-to-improve-the-use-and-usefulness-of-research-in-education

An infrastructure could include elements such as formal policies, codified practices, established offices, and interagency coordinating structures.

Fortunately, there are existing efforts that the Commission could build upon. The Department of Labor and the Department of Health and Human Services, Administration for Children and Families both created evaluation policies that can serve as models for other agencies.[5] The Department of Labor created a Chief Evaluation Office, and conducts an annual survey to assess its performance meeting the research needs of program offices. HHS Administration for Children and Families, Office of Planning Research and Evaluation also published a set of principles to guide all of its evaluation work.[6] Further, the Institute of Education Sciences has protections, granted by Congress in its authorizing language, that support scientific integrity and independence from political influence.

Additionally, a subset of learning group participants funded a National Academy of Sciences Roundtable to consider an infrastructure for evaluation that parallels the existing infrastructure for statistical agencies. (Federal statistical agencies receive support from a Chief Statistician housed at the White House Office of Management and Budget; a public-private, interagency Committee on National Statistics; and a carefully codified and updated set of Principles and Practices for a Federal Statistical Agency.[7]) The Commission may wish to be briefed on this effort. The Commission may also wish to be briefed on the types of infrastructure that have been created to support federal agencies' performance management functions, such as the role the federal Performance Improvement Council plays in fostering widespread and effective use of performance management practices across federal agencies and sparking cross-cutting performance improvements.[8]

Conclusion

The creation of the Commission on Evidence-Based Policymaking is well timed. As shared in the William T. Grant Foundation's recent blog series *Evidence at the Crossroads*, "research evidence can improve public policies and programs, but fulfilling that potential will require honest assessments of current initiatives, coming to terms with outsized expectations, and learning ways to improve social interventions and public systems."[9]

The Commission is well positioned to drive this work forward, especially if it focuses on the full continuum of activity from sharing and linking data, to using those data to create research evidence, to using that evidence to inform policymaking.

Memorandum

TO: The Commission on Evidence-based Policy

FROM: Members of the Interagency Council on Evaluation Policy

SUBJECT: "Top-5 List" of issues and solutions related to Federal evaluation activity

DATE: November 22, 2016

Several individual members of the Interagency Council on Evaluation Policy appreciate the opportunity to provide input to the Commissioners as you proceed to consider strategies to improve data for use in evidence-building. The following are the top issues of concern to Federal evaluation offices, along with several solutions for the Commission to consider.

1. ISSUE: *Key federal administrative and statistical data sources* are inaccessible for evaluation purposes or incomplete as a result of statute, policy, or administrative practices.

   SOLUTION: Establish a mechanism to assist agencies to act upon their M-14-06 statistical and administrative data priorities:
   a. <u>Establish cooperative information technology procedures (e.g., data security, privacy, and data maintenance) for Federal agencies that share or exchange data to do so more efficiently</u> (currently agencies have different informational technology and privacy rules and procedures which typically requires a new or modified memorandum of agreement)
   b. <u>Establish expedited procedures for Federal agencies to more easily and directly access data from Federal statistical agencies for evaluations</u> (e.g., develop special approval and access procedures for Federal agencies rather than requiring them to follow the cumbersome general public procedures for accessing data through Census Research Data Centers; allow federal agencies to access the data directly from secure Federal offices and computers).
   c. <u>Require records in some key Federal data bases used for evaluations, such as the National Directory of New Hires (NDNH) to be maintained permanently</u> to allow data to be linked and tracked for evaluations requiring long-term data (e.g., pre-program and post-program follow up).

2. ISSUE: *Federal evaluation capacity and activity* is uneven across agencies

   SOLUTION: Establish an independent federal evaluation system to 1) articulate the specific role and value of evaluation in evidence-building, 2) facilitate the development of strong, independent evaluation offices in all agencies, and 3) reinforce the importance of evaluation offices to strengthen the support for the offices within their agencies.

a. <u>Encourage Departments and Agencies to establish independent evaluation offices</u> to coordinate evaluation efforts and build evaluation capacity, but also acknowledge there is often a complementary and important role for special independent research institutes, bureaus or offices where they exist (e.g., DOJ-NIJ, USDA-ERS, DOL-BLS, Commerce-Census).

b. <u>Develop general principles and practices for Federal evaluation offices</u> (see NAS workshop)

c. <u>Clarify that evaluation and evidence-building is a unique activity, not to be conflated with data collection or performance measurement and monitoring</u>:
   i. Evidence is not reducible to data (see Goldstein/ACF testimony)
   ii. Evaluation capacity is not reducible to data collection capacity (see Goldstein/ACF testimony)
   iii. Rigorous evaluation is not reducible to impact studies using RCTs (see Goldstein/ACF testimony)

d. <u>Establish an interagency evaluation coordination structure</u> (see Goldstein/ACF testimony)

e. <u>Make the Federal evaluation system a complement and counterpart to the Federal statistical system rather than subsumed by the latter</u> (see Goldstein/ACF testimony)

f. <u>Strengthen and clarify privacy/confidentiality protections that also allow access for Federal evaluations</u> by clarifying statutory provisions in the Privacy Act, Freedom of Information Act, and the Family Educational Rights and Privacy Act (see O'Regan/HUD testimony)

3. ISSUE: Often there is no or *inadequate funding* available to conduct rigorous evaluations

   SOLUTION: Ensure adequate evaluation funding
   a. <u>Expand flexible evaluation funding set-aside authority</u> to more agencies to allow funding for program evaluations
   b. <u>Embed evaluation funding and requirements</u> into programs when possible
   c. <u>Increase cross-agency transfer authority to allow combining funding</u> for evaluations that span multiple programs/agencies when appropriate (see Solution 1.b. above).

4. ISSUE: A number of *bureaucratic barriers* discourage evaluation, create inefficiencies and pose additional costs when conducting a Federal evaluation, particularly issues related to PRA, IAAs, and procurement.

   SOLUTION: Reduce bureaucratic complexity and barriers to evaluation
   a. <u>Streamline PRA requirements for Federal evaluations to minimize cost and time</u>:
      i. Assign PRA responsibility to agencies on collections below some threshold such as 1,000 responses or under 500 burden hours (see O'Regan/HUD testimony)

        ii.   Allow PRA responsibility to be assigned to agency evaluation offices that have established formal clearance, peer/technical review, statistical expertise, and public notice procedures

      iii.   Reduce requirements for public comment periods in some cases, e.g. no second public comment period if there are no substantive comments during the first period.

  b. Streamline the Federal Interagency Agreement (IAA) processes to allow more efficient collaboration and sharing of funds for cross-agency evaluations and data exchanges:

      i.   Use pre-approved agreement templates for expedited clearance in Federal agencies

      ii.   Standardize the legal procedures and requirements across Departments to facilitate and speed up interagency agreements.

  c. Allow more flexible procurement strategies for evaluations to improve study quality and efficiency (see 2017 President's Budget)

      i.   Allow Federal agencies a five year period of funds availability to allow agencies to pool funds over multiple years to pay for large, long-term evaluations.

      ii.   Provide Federal evaluation agencies with the authority to recapture, and re-obligate for other studies, unused funds not needed to complete a particular study (e.g., unused termination costs, or cost savings from projects that proceed more quickly than expected).

5. Each agency has unique data requirements for program evaluations. Below are examples of specific solutions that relate to evaluations using employment, wages, tax, research projects, health, and education data):

  a. Allow access to the National Directory of New Hires (NDNH) employment and earnings data for Federal evaluations (see FY 2017 President's Budget pp. 303-307, 328-330: https://www.acf.hhs.gov/sites/default/files/olab/final_cj_2017_print.pdf), and maintain the records for longer periods of time to allow for long-term follow-up.

  b. Allow administrative data with unique identification and collected in workforce development, education, research grants, public housing, social services and public assistance programs to be linked at the individual level and shared among Federal agencies for evaluations (with appropriate security and privacy protections). (For WIOA example see President's Budget Fiscal Year 2016: Analytical Perspectives, pp. 69-70: https://www.whitehouse.gov/sites/default/files/omb/budget/fy2016/assets/spec.pdf).

  c. Improve Federal agency access to the Longitudinal Employer and Household Dynamics (LEHD) files for evaluations.

  d. Improve access to individual level student-level data (e.g., K-12 and post-secondary) for Federal evaluations (with appropriate security and privacy protections) (see testimony of multiple witnesses at October public hearing).

      e.   <u>Improve the ability of the vital statistics systems to be more interoperable</u>
with other electronic healthy data systems and foster the use of national
standards on birth and death statistics to support interoperability for
evaluation and research.

We would be happy to discuss any of these issues or solutions. Please feel free to contact any of

Washington, DC 20510

The Honorable Harry Reid
Senate Minority Leader
522 Hart Senate Office Building
Washington, DC 20510

Dear Mr. President, Mr. Speaker, Congresswoman Pelosi, Senator McConnell and Senator Reid;

On behalf of the National Association of State Workforce Agencies (NASWA), we support the newly established Commission on Evidence Based Policy Making from Public Law 114-140 (H.R. 1831), but believe there is a perspective missing. We respectfully request your consideration for state administrators of the public workforce system to either participate and/or be utilized by the Commission.

States are a crucial partner of the federal government in funding and administering public workforce programs, and have important responsibilities safeguarding data and developing solutions to integrate and share data. The recently enacted Workforce Innovation and Opportunity Act (WIOA) highlights and elevates these responsibilities, requiring states to develop integrated data systems across a range of workforce development, education and human services programs. The Commission's goals to find the best way to organize, protect and analyze data to improve public policy can better be accomplished with the involvement and expertise of state partners.

Additionally, states have a rich history innovating in these areas and working with federal partners to test new approaches using rigorous designs. The resulting evidence has been critical to policy development. In the workforce development area alone, states have helped build a twenty-five year history of evidence on the value of reemployment services for UI claimants. While funding for states to analyze data and conduct evaluations has dwindled, state interest remains strong, more should be done, and the federal government cannot move forward alone.

We look forward to your consideration of utilizing the state administrators of the public workforce system and supporting the Commission's mission.

Sincerely,

Dale Peinecke, Commissioner
Washington State Employment Security Department
NASWA Board President

Scott B. Sanders, Executive Director
NASWA

NASWA is a national organization of state administrators of the publicly-funded state workforce system, including the Workforce Innovation and Opportunity Act (WIOA), employment services, training programs, unemployment insurance, employment statistics and labor market information. NASWA's goal is to drive the national workforce agenda by providing policy expertise on workforce development, including unemployment insurance issues that support transition to new jobs and careers.

General Comment

This is a comment in response to overarching question #1:

One way systematic evidence developed with government data can be deployed to improve policy choices is through the federal budget process. Paul Posner and I have proposed a change in that process that would make room each year for deeper, evidence-based, systemic analysis of a handful of major national policy objectives. For each objective, this alternative, goal-focused "portfolio budgeting" approach would group together and thus look broadly across the set of related programs, tax provisions, regulatory, and other federal policies affecting the goal. The relevant policy portfolio would typically cut across agency boundaries and congressional committee jurisdictions. For the goal of expanding access to higher education, for example, it would include loans and grants administered by the Department of Education, GI Bill benefits for veterans, and various tax provisions that support savings for college and charitable giving to college endowments used for scholarships.

For each goal, analysis would assess how current federal strategy for using resources -

implied by the current portfolio of spending, tax expenditures, and other policies - incentives and shapes the behavior of other actors in the system. Combining data from multiple federal administrative data bases would facilitate evaluation of the interactive and combined effects of federal policies. Analysis would compare the effectiveness of today's federal strategy with alternative strategies that could make better use of resources to accelerate progress toward the goal and possibly generate budget savings. Through the budget process, potential budget savings could either be reinvested in this goal or used for other priorities, including deficit reduction.

The process now used to develop the federal budget is biased toward the incremental, the short term, and the familiar. It also is piecemeal and fragmented, considering issues in narrow programmatic categories and giving most scrutiny to marginal changes in spending, largely ignoring tax policies. The way budgets are developed is too often blind to the major shifts sweeping over the nation's economy and social structure. The result is little change and inadequate focus on national priorities or how to achieve them more efficiently. That is why a portfolio approach is needed.

Building on growing executive branch experience with strategic analysis and reviews, portfolio budgeting would use policy makers' time more efficiently by helping them focus on the biggest opportunities to adjust policies and resources to accelerate the achievement of major national goals and identifying breakthrough gains in productive use of resources. For Congress, the House and Senate budget committees could organize the process by annually identifying a small set of major policy goals for analysis; asking GAO, CBO, or the congressionally chartered national academies to assess current strategy relative to alternatives; and in their subsequent budget resolutions, developed in consultation with congressional leaders, other committees, and the Administration, include policy guidance and estimates for an alternative that would use budget resources more productively.

More details on implementing a portfolio budgeting approach can be found at http://www.brookings.edu/research/papers/2015/09/30-portfolio-budgeting-new-approach-redburn-posner and in the National Budgeting Roundtable working paper on budgeting for national goals at http://psc.gmu.edu/wp-content/uploads/New-Ideas-for-Federal-Budget-Working-Paper-No.-2.pdf .

Commission on Evidence-Based Policymaking Comments: Docket ID USBC-2016-0003

September 27, 2016

Dr. Katharine G. Abraham, Chair
Mr. Ron Haskins, Co-Chair
Evidence-Based Policymaking Commission
U.S. Census Bureau
4600 Silver Hill Road
Suitland, MD 20746

Dear Chairwoman Abraham and Co-Chairman Haskins,

We are writing to encourage you to consider the attached policy recommendations as a response to your request for public comment. **These recommendations address Questions 3, 4, 15, 16, and 19 in the Notice Document requesting public comments**.

We believe that the Commission can help invest taxpayer dollars in what works by assisting policymakers at all levels of government in:

- Building evidence about the practices, policies and programs that will achieve the most effective and efficient results so that policymakers can make better decisions;
- Investing limited taxpayer dollars in practices, policies and programs that use data, evidence and evaluation to demonstrate they work; and
- Directing funds away from practices, policies, and programs that consistently fail to achieve measurable outcomes.

Although the Evidence-Based Policymaking Commission Act of 2016 directs the Commission to study and report on several important topics including data privacy and data sharing, our attached policy proposals focus on the provision that directs the Commission to "make recommendations on how best to incorporate outcomes measurement, institutionalize randomized controlled trials, and rigorous impact analysis into program design."

We thank you in advance for your consideration of our recommendations.

Sincerely,

Actionable Intelligence for Social Policy (AISP)

Commission on Evidence-Based Policymaking Comments: Docket ID USBC-2016-0003

INVEST IN WHAT WORKS COALITION RECOMMENDATIONS ADDRESSING QUESTIONS 3, 4, 15, 16, AND 19

Data Collection

- **Federal Data Infrastructure**: The Commission should consider recommending that Congress and the Administration provide sufficient funding to help the U.S. Census Bureau accelerate the process of acquiring key administrative data-sets from local, state, and federal agencies, and strengthen its infrastructure for processing, standardizing, linking, and making data available to other government agencies and independent researchers via data use agreements with strong privacy protections. As part of this effort, the Census Bureau should develop an inventory of data-sets at the local, state, and federal levels and make this inventory accessible to government agencies and independent researchers.

- **Federal Data Inventories**: The Commission should consider recommending that Congress and the Administration codify into law what is already required by the May 2013 Executive Order by passing the OPEN Government Data Act. This legislation would mandate that every federal agency create an enterprise data inventory of all data sets held by the agency and make these lists public in machine-readable formats with strong privacy protections.

- **Federal Data Information Technology:** The Commission should consider recommending that Congress and the Administration provide sufficient funding to allow every federal agency to update and modernize its IT infrastructure that supports data collection, analysis, sharing, and usage so that data can be appropriately structured, protected, analyzed and disclosed in line with the updated information policy of the United States. A 2016 report by the U.S. General Accountability Office highlighted the urgent need for the U.S. government to modernize its aging legacy systems.

- **Workforce Data**: The Commission should recommend that Congress and the Administration allow the linking of workforce datasets (including but not limited to state and federal unemployment insurance and new hires data sets) to improve the effectiveness and efficiency of publicly-supported workforce development programs, as long as the linking is consistent with strong privacy protections. For example, many states cannot determine the impact of their job training programs without the ability to link their participant information with information about wage earnings across multiple states where participants obtain employment.

- **State Education and Workforce Data Systems**: The Commission should recommend that Congress and the Administration support the enhancement of the existing State Longitudinal Data Systems (SLDS) program administered by the U.S. Department of Education, which helps states integrate education and workforce data, and the proposed expansion of the Workforce Data Quality Initiative that would help build state and local capacity to track employment and educational outcomes of Workforce Innovation and Opportunity Act program participants, including those with disabilities, and provide information about job success rates and training programs.

Commission on Evidence-Based Policymaking Comments: Docket ID USBC-2016-0003

- **Federal Education Data Identifiers**: The Commission should consider recommending that Congress and the Administration direct federal agencies to standardize the way they collect and share student-level identifiers (e.g., de-identified but encrypted) so that researchers can more effectively evaluate publicly-supported education and workforce development programs. This information should be housed in one federal agency in order to promote appropriate sharing and usage of this standardized data.

- **Federal Programmatic Data:** The Commission should consider recommending that Congress and the Administration authorize every federal agency to set aside 1% of their program funds for program evaluations that generate programmatic outcomes data that can help make federal programs more effective and efficient.

Data Analysis

- **Data Leadership and Infrastructure**: The Commission should consider recommending that Congress and the Administration direct every federal agency to have a senior staff member (i.e., Chief Evaluation Officer or equivalent position) with the authority, staff, and budget to develop important programmatic data through the evaluation of its major programs and to use this programmatic data and available administrative data to inform the agency's policies and improve its programs.

Data Sharing

- **Local and State Data Systems**: The Commission should consider recommending that Congress and the Administration clarify that local and state agencies can invest federal program funds in strengthening their data infrastructures for processing, standardizing, linking, and making data available to other government agencies and independent researchers via data use agreements with strong privacy protections.

- **Federal Education Data Infrastructure:** The Commission should consider recommending that Congress and the Administration strengthen the U.S. Department of Education's (ED's) data infrastructure, including the hiring and training of key analytic staff, to manage the collection, quality, release, and analysis of education data with strong privacy protections and the support the proposed InformED initiative that would pull together ED's diverse array of data and studies on a particular topic, and allow open data access to help unlock answers to pressing education questions and needs.

Data Usage

- "**What Works" Clearinghouses:** The Commission should consider recommending that Congress and the Administration direct every federal agency to develop a "What Works" clearinghouse or evidence exchange with the purpose of making evaluation reports available to the public.

- **Performance Management/Continuous Improvement:** The Commission should consider recommending that Congress and the Administration direct every federal agency to develop

Commission on Evidence-Based Policymaking Comments: Docket ID USBC-2016-0003

and operate a performance management system with clear and prioritized outcome-focused goals and aligned program objectives and that frequently collects, analyzes, and uses administrative and programmatic outcomes data to improve outcomes, return on investment, and other dimensions of performance.

- **Federal Grant Programs**: The Commission should consider recommending that Congress and the Administration direct every federal agency to use evidence of effectiveness, including impact analysis and other outcomes measurements based on high-quality administrative and programmatic outcomes data, when allocating funds from its 5 largest competitive and non-competitive grant programs.

- **Evaluation and Research**: The Commission should consider recommending that Congress and the Administration direct every federal agency to have an evaluation policy, evaluation plan, and research/learning agenda which ensures that the agency has an intentional approach to the collection, analysis, sharing, and usage of administrative and programmatic data and publicly release the findings of all completed evaluations to improve the effectiveness and efficiency of federal programs.

- **Repurpose for Results**: The Commission should consider recommending that Congress and the Administration direct every federal agency to use its administrative and programmatic data to determine when to shift funds away from practices, policies, and programs which consistently fail to achieve desired outcomes and toward evidence-based, results-driven solutions.

General Comment

More detailed data about individuals (the sort of information that is vulnerable to privacy violations) and efforts to attain 100 percent data collection does not lead to better decision-making and is a waste of effort and money.

Dear Drs. Hart and Reamer,

In response to the request and the posting in ASA Connect, the attached articles (The ASA Statement on statistical significance and P-values, and supplementary article on misinterpretations) may be of interest,
especially regarding question 16 (How can data, statistics, results of research, and findings from evaluation, be best used to improve policies and programs?).
The material may be of particular import given the large number of articles in health and medicine whose published conclusions are based on elementary misinterpretations of their own statistical outputs.

The attachments are published with open access and may be distributed non-commercially.

Best Regards,
Sander Greenland

Greenland Senn Rothman Carlin Poole Goodman Altman.Testing CI misinterpretation.TAS 2016

Wasserstein Lazar.ASA Statement on P-values.7-2016

Statistical Tests, P-values, Confidence Intervals, and Power: A Guide to Misinterpretations

Sander GREENLAND, Stephen J. SENN, Kenneth J. ROTHMAN, John B. CARLIN, Charles POOLE, Steven N. GOODMAN, and Douglas G. ALTMAN

Misinterpretation and abuse of statistical tests, confidence intervals, and statistical power have been decried for decades, yet remain rampant. A key problem is that there are no interpretations of these concepts that are at once simple, intuitive, correct, and foolproof. Instead, correct use and interpretation of these statistics requires an attention to detail which seems to tax the patience of working scientists. This high cognitive demand has led to an epidemic of shortcut definitions and interpretations that are simply wrong, sometimes disastrously so—and yet these misinterpretations dominate much of the scientific literature.

In light of this problem, we provide definitions and a discussion of basic statistics that are more general and critical than typically found in traditional introductory expositions. Our goal is to provide a resource for instructors, researchers, and consumers of statistics whose knowledge of statistical theory and technique may be limited but who wish to avoid and spot misinterpretations. We emphasize how violation of often unstated analysis protocols (such as selecting analyses for presentation based on the P-values they produce) can lead to small P-values even if the declared test hypothesis is correct, and can lead to large P-values even if that hypothesis is incorrect. We then provide an explanatory list of 25 misinterpretations of P-values, confidence intervals, and power. We conclude with guidelines for improving statistical interpretation and reporting.

KEY WORDS: Confidence intervals; Hypothesis testing; Null testing; P-value; Power; Significance tests; Statistical testing.

Introduction

Misinterpretation and abuse of statistical tests has been decried for decades, yet remains so rampant that some scientific journals discourage use of "statistical significance" (classifying results as "significant" or not based on a P-value) (Lang et al. 1998). One journal now bans all statistical tests and mathematically related procedures such as confidence intervals (Trafimow and Marks 2015), which has led to considerable discussion and debate about the merits of such bans (e.g., Ashworth 2015; Flanagan 2015).

Despite such bans, we expect that the statistical methods at issue will be with us for many years to come. We thus think it imperative that basic teaching as well as general understanding of these methods be improved. Toward that end, we attempt to explain the meaning of significance tests, confidence intervals, and statistical power in a more general and critical way than is traditionally done, and then review 25 common misconceptions in light of our explanations. We also discuss a few more subtle but nonetheless pervasive problems, explaining why it is important to examine and synthesize all results relating to a scientific question, rather than focus on individual findings. We further explain why statistical tests should never constitute the sole input to inferences or decisions about associations or effects. Among the many reasons are that, in most scientific settings, the arbitrary classification of results into "significant" and "nonsignificant" is unnecessary for and often damaging to valid interpretation of data; and that estimation of the size of effects and the uncertainty surrounding our estimates will be far more important for scientific inference and sound judgment than any such classification.

More detailed discussion of the general issues can be found in many articles, chapters, and books on statistical methods and their interpretation (e.g., Altman et al. 2000; Atkins and Jarrett 1979; Cox 1977, 1982; Cox and Hinkley 1974; Freedman et al. 2007; Gibbons and Pratt 1975; Gigerenzer et al. 1990, Ch. 3; Harlow et al. 1997; Hogben 1957; Kaye and Freedman 2011; Morrison and Henkel 1970; Oakes 1986; Pratt 1965; Rothman et al. 2008, Ch. 10; Ware et al. 2009; Ziliak and McCloskey 2008). Specific issues are covered at length in these sources and in the many peer-reviewed articles that critique common misinterpretations of null-hypothesis testing and "statistical significance" (e.g., Altman and Bland 1995; Anscombe 1990; Bakan 1966; Bandt and Boen 1972; Berkson 1942; Bland and Altman 2015; Chia 1997; Cohen 1994; Evans et al. 1988; Fidler and Loftus 2009; Gardner and Altman 1986; Gelman 2013; Gelman and Loken 2014; Gelman and Stern 2006; Gigerenzer 2004;

Gigerenzer and Marewski 2015; Goodman 1992, 1993, 1999, 2008; Greenland 2011, 2012ab; Greenland and Poole, 2011, 2013ab; Grieve 2015; Harlow et al. 1997; Hoekstra et al. 2006; Hurlbert and Lombardi 2009; Kaye 1986; Lambdin 2012; Lang et al. 1998; Langman 1986; LeCoutre et al. 2003; Lew 2012; Loftus 1996; Matthews and Altman 1996a; Pocock and Ware 2009; Pocock et al. 1987; Poole 1987ab, 2001; Rosnow and Rosenthal 1989; Rothman 1978, 1986; Rozeboom 1960; Salsburg 1985; Schmidt 1996; Schmidt and Hunter 2002; Sterne and Davey Smith 2001; Thompson 1987; Thompson 2004; Wagenmakers 2007; Walker 1986; Wood et al. 2014).

Statistical Tests, *P*-values, and Confidence Intervals: A Caustic Primer

Statistical Models, Hypotheses, and Tests

Every method of statistical inference depends on a complex web of assumptions about how data were collected and analyzed, and how the analysis results were selected for presentation. The full set of assumptions is embodied in a *statistical model* that underpins the method. This model is a mathematical representation of data variability, and thus ideally would capture accurately all sources of such variability. Many problems arise, however, because this statistical model often incorporates unrealistic or at best unjustified assumptions. This is true even for so-called "nonparametric" methods, which (like other methods) depend on assumptions of random sampling or randomization. These assumptions are often deceptively simple to write mathematically, yet in practice are difficult to satisfy and verify, as they may depend on successful completion of a long sequence of actions (such as identifying, contacting, obtaining consent from, obtaining cooperation of, and following up subjects, as well as adherence to study protocols for treatment allocation, masking, and data analysis).

There is also a serious problem of defining the scope of a model, in that it should allow not only for a good representation of the observed data but also of hypothetical alternative data that might have been observed. The reference frame for data that "might have been observed" is often unclear, for example if multiple outcome measures or multiple predictive factors have been measured, and many decisions surrounding analysis choices have been made after the data were collected—as is invariably the case (Gelman and Loken 2014).

The difficulty of understanding and assessing underlying assumptions is exacerbated by the fact that the statistical model is usually presented in a highly compressed and abstract form—if presented at all. As a result, many assumptions go unremarked and are often unrecognized by users as well as consumers of statistics. Nonetheless, all statistical methods and interpretations are premised on the model assumptions; that is, on an assumption that the model provides a valid representation of the variation we would expect to see across data sets, faithfully reflecting the circumstances surrounding the study and phenomena occurring within it.

In most applications of statistical testing, one assumption in the model is a hypothesis that a particular effect has a specific size, and has been targeted for statistical analysis. (For sim-

plicity, we use the word "effect" when "association or effect" would arguably be better in allowing for noncausal studies such as most surveys.) This targeted assumption is called the study hypothesis or *test hypothesis*, and the statistical methods used to evaluate it are called *statistical hypothesis tests*. Most often, the targeted effect size is a "null" value representing *zero* effect (e.g., that the study treatment makes no difference in average outcome), in which case the test hypothesis is called the *null hypothesis*. Nonetheless, it is also possible to test other effect sizes. We may also test hypotheses that the effect does or does not fall within a specific range; for example, we may test the hypothesis that the effect is no greater than a particular amount, in which case the hypothesis is said to be a *one-sided* or *dividing* hypothesis (Cox 1977, 1982).

Much statistical teaching and practice has developed a strong (and unhealthy) focus on the idea that the main aim of a study should be to test null hypotheses. In fact most descriptions of statistical testing focus *only* on testing null hypotheses, and the entire topic has been called "Null Hypothesis Significance Testing" (NHST). This exclusive focus on null hypotheses contributes to misunderstanding of tests. Adding to the misunderstanding is that many authors (including R.A. Fisher) use "null hypothesis" to refer to any test hypothesis, even though this usage is at odds with other authors and with ordinary English definitions of "null"—as are statistical usages of "significance" and "confidence."

Uncertainty, Probability, and Statistical Significance

A more refined goal of statistical analysis is to provide an evaluation of certainty or uncertainty regarding the size of an effect. It is natural to express such certainty in terms of "probabilities" of hypotheses. In conventional statistical methods, however, "probability" refers not to hypotheses, but to quantities that are hypothetical frequencies of data patterns under an assumed statistical model. These methods are thus called *frequentist* methods, and the hypothetical frequencies they predict are called "frequency probabilities." Despite considerable training to the contrary, many statistically educated scientists revert to the habit of misinterpreting these frequency probabilities as hypothesis probabilities. (Even more confusingly, the term "likelihood of a parameter value" is reserved by statisticians to refer to the probability of the observed data *given* the parameter value; it does not refer to a probability of the parameter taking on the given value.)

Nowhere are these problems more rampant than in applications of a hypothetical frequency called the *P-value*, also known as the "observed significance level" for the test hypothesis. Statistical "significance tests" based on this concept have been a central part of statistical analyses for centuries (Stigler 1986). The focus of traditional definitions of *P*-values and statistical significance has been on null hypotheses, treating all other assumptions used to compute the *P*-value as if they were known to be correct. Recognizing that these other assumptions are often questionable if not unwarranted, we will adopt a more general view of the *P*-value as a statistical summary of the compatibility between the observed data and what we would predict or expect to see if we knew the entire statistical model (*all* the

assumptions used to compute the P-value) were correct.

Specifically, the distance between the data and the model prediction is measured using a *test statistic* (such as a t-statistic or a chi-squared statistic). The P-value is then the probability that the chosen test statistic would have been *at least* as large as its observed value if *every* model assumption were correct, including the test hypothesis. This definition embodies a crucial point lost in traditional definitions: In logical terms, the P-value tests *all* the assumptions about how the data were generated (the entire model), not just the targeted hypothesis it is supposed to test (such as a null hypothesis). Furthermore, these assumptions include far more than what are traditionally presented as modeling or probability assumptions—they include assumptions about the conduct of the analysis, for example that intermediate analysis results were not used to determine which analyses would be presented.

It is true that the smaller the P-value, the more unusual the data would be *if* every single assumption were correct; but a very small P-value does *not* tell us which assumption is incorrect. For example, the P-value may be very small because the targeted hypothesis is false; but it may instead (or in addition) be very small because the study protocols were violated, or because it was selected for presentation based on its small size. Conversely, a large P-value indicates only that the data are not unusual under the model, but does not imply that the model or any aspect of it (such as the targeted hypothesis) is correct; it may instead (or in addition) be large because (again) the study protocols were violated, or because it was selected for presentation based on its large size.

The general definition of a P-value may help one to understand why statistical tests tell us much less than what many think they do: Not only does a P-value *not* tell us whether the hypothesis targeted for testing is true or not; it says nothing specifically related to that hypothesis unless we can be completely assured that every other assumption used for its computation is correct—an assurance that is lacking in far too many studies.

Nonetheless, the P-value can be viewed as a continuous measure of the compatibility between the data and the entire model used to compute it, ranging from 0 for complete incompatibility to 1 for perfect compatibility, and in this sense may be viewed as measuring the fit of the model to the data. Too often, however, the P-value is degraded into a dichotomy in which results are declared "statistically significant" if P falls on or below a cut-off (usually 0.05) and declared "nonsignificant" otherwise. The terms "significance level" and "alpha level" (α) are often used to refer to the cut-off; however, the term "significance level" invites confusion of the cut-off with the P-value itself. Their difference is profound: the cut-off value α is supposed to be fixed in advance and is thus part of the study design, unchanged in light of the data. In contrast, the P-value is a number computed from the data and thus an analysis result, unknown until it is computed.

Moving From Tests to Estimates

We can vary the test hypothesis while leaving other assumptions unchanged, to see how the P-value differs across competing test hypotheses. Usually, these test hypotheses specify dif-

ferent sizes for a targeted effect; for example, we may test the hypothesis that the average difference between two treatment groups is zero (the null hypothesis), or that it is 20 or –10 or any size of interest. The effect size whose test produced $P = 1$ is the size most compatible with the data (in the sense of predicting what was in fact observed) *if* all the other assumptions used in the test (the statistical model) were correct, and provides a *point estimate* of the effect under those assumptions. The effect sizes whose test produced $P > 0.05$ will typically define a range of sizes (e.g., from 11.0 to 19.5) that would be considered more compatible with the data (in the sense of the observations being closer to what the model predicted) than sizes outside the range—again, if the statistical model were correct. This range corresponds to a $1 - 0.05 = 0.95$ or 95% *confidence interval*, and provides a convenient way of summarizing the results of hypothesis tests for many effect sizes. Confidence intervals are examples of *interval estimates*.

Neyman (1937) proposed the construction of confidence intervals in this way because they have the following property: If one calculates, say, 95% confidence intervals repeatedly *in valid applications*, 95% of them, on average, will contain (i.e., include or cover) the true effect size. Hence, the specified confidence level is called the *coverage probability*. As Neyman stressed repeatedly, this coverage probability is a property of a long sequence of confidence intervals computed from valid models, rather than a property of any single confidence interval.

Many journals now require confidence intervals, but most textbooks and studies discuss P-values only for the null hypothesis of no effect. This exclusive focus on null hypotheses in testing not only contributes to misunderstanding of tests and underappreciation of estimation, but also obscures the close relationship between P-values and confidence intervals, as well as the weaknesses they share.

What P-values, Confidence Intervals, and Power Calculations Don't Tell Us

Much distortion arises from basic misunderstanding of what P-values and their relatives (such as confidence intervals) do *not* tell us. Therefore, based on the articles in our reference list, we review prevalent P-value misinterpretations as a way of moving toward defensible interpretations and presentations. We adopt the format of Goodman (2008) in providing a list of misinterpretations that can be used to critically evaluate conclusions offered by research reports and reviews. Every one of the italicized statements in our list has contributed to statistical distortion of the scientific literature, and we add the emphatic "No!" to underscore statements that are not only fallacious but also not "true enough for practical purposes."

Common Misinterpretations of Single P-values

1. The P-value is the probability that the test hypothesis is true; for example, if a test of the null hypothesis gave $P = 0.01$, the null hypothesis has only a 1% chance of being true; if instead it gave $P = 0.40$, the null hypothesis has a 40% chance of being true.—No! The P-value *assumes* the test hypothesis is true—it is *not* a hypothesis probability and may be far from any

reasonable probability for the test hypothesis. The P-value simply indicates the degree to which the data conform to the pattern predicted by the test hypothesis and all the other assumptions used in the test (the underlying statistical model). Thus $P = 0.01$ would indicate that the data are not very close to what the statistical model (including the test hypothesis) predicted they should be, while $P = 0.40$ would indicate that the data are much closer to the model prediction, allowing for chance variation.

2. The P-value for the null hypothesis is the probability that chance alone produced the observed association; for example, if the P-value for the null hypothesis is 0.08, there is an 8% probability that chance alone produced the association.—No! This is a common variation of the first fallacy and it is just as false. To say that chance *alone* produced the observed association is logically equivalent to asserting that every assumption used to compute the P-value is correct, *including the null hypothesis*. Thus to claim that the null P-value is the probability that chance alone produced the observed association is completely backwards: The P-value is a probability computed *assuming* chance was operating alone. The absurdity of the common backwards interpretation might be appreciated by pondering how the P-value, which is a probability deduced *from* a set of assumptions (the statistical model), can possibly refer to the probability *of* those assumptions.

Note: One often sees "alone" dropped from this description (becoming "the P-value for the null hypothesis is the probability that chance produced the observed association"), so that the statement is more ambiguous, but just as wrong.

3. A significant test result (P ≤ 0.05) means that the test hypothesis is false or should be rejected.—No! A small P-value simply flags the data as being unusual if all the assumptions used to compute it (including the test hypothesis) were correct; it may be small because there was a large random error or because some assumption other than the test hypothesis was violated (for example, the assumption that this P-value was not selected for presentation because it was below 0.05). $P \leq 0.05$ only means that a discrepancy from the hypothesis prediction (e.g., no difference between treatment groups) would be as large *or larger than* that observed no more than 5% of the time if *only* chance were creating the discrepancy (as opposed to a violation of the test hypothesis or a mistaken assumption).

4. A nonsignificant test result (P > 0.05) means that the test hypothesis is true or should be accepted.—No! A large P-value only suggests that the data are *not* unusual if all the assumptions used to compute the P-value (including the test hypothesis) were correct. The same data would also not be unusual under many other hypotheses. Furthermore, even if the test hypothesis is wrong, the P-value may be large because it was inflated by a large random error or because of some other erroneous assumption (e.g., the assumption that this P-value was not selected for presentation because it was above 0.05). $P > 0.05$ only means that a discrepancy from the hypothesis prediction (e.g., no difference between treatment groups) would be as large *or larger* than that observed more than 5% of the time if *only* chance were creating the discrepancy.

5. A large P-value is evidence in favor of the test hypothesis.—No! In fact, any P-value less than 1 implies that the test hypothesis is *not* the hypothesis most compatible with the data, because any other hypothesis with a larger P-value would be even more compatible with the data. A P-value cannot be said to favor the test hypothesis except in relation to those hypotheses with smaller P-values. Furthermore, a large P-value often indicates only that the data are incapable of discriminating among many competing hypotheses (as would be seen immediately by examining the range of the confidence interval). For example, many authors will misinterpret $P = 0.70$ from a test of the null hypothesis as evidence for no effect, when in fact it indicates that, even though the null hypothesis is compatible with the data under the assumptions used to compute the P-value, it is *not* the hypothesis most compatible with the data—that honor would belong to a hypothesis with $P = 1$. But even if $P = 1$, there will be many other hypotheses that are highly consistent with the data, so that a definitive conclusion of "no association" cannot be deduced from a P-value, no matter how large.

6. A null-hypothesis P-value greater than 0.05 means that no effect was observed, or that absence of an effect was shown or demonstrated.—No! Observing $P > 0.05$ for the null hypothesis only means that the null is one among the many hypotheses that have $P > 0.05$. Thus, unless the point estimate (observed association) equals the null value exactly, it is a mistake to conclude from $P > 0.05$ that a study found "no association" or "no evidence" of an effect. If the null P-value is less than 1 some association must be present in the data, and one must look at the point estimate to determine the effect size most compatible with the data under the assumed model.

7. Statistical significance indicates a scientifically or substantively important relation has been detected.—No! Especially when a study is large, very minor effects or small assumption violations can lead to statistically significant tests of the null hypothesis. Again, a small null P-value simply flags the data as being unusual if all the assumptions used to compute it (including the null hypothesis) were correct; but the way the data are unusual might be of no clinical interest. One must look at the confidence interval to determine which effect sizes of scientific or other substantive (e.g., clinical) importance are relatively compatible with the data, given the model.

8. Lack of statistical significance indicates that the effect size is small.—No! Especially when a study is small, even large effects may be "drowned in noise" and thus fail to be detected as statistically significant by a statistical test. A large null P-value simply flags the data as *not* being unusual if all the assumptions used to compute it (including the test hypothesis) were correct; but the same data will also not be unusual under many other models and hypotheses besides the null. Again, one must look at the confidence interval to determine whether it includes effect sizes of importance.

4   Online Supplement to the ASA Statement on Statistical Significance and P-values

9. The P-value is the chance of our data occurring if the test hypothesis is true; for example, P = 0.05 means that the observed association would occur only 5% of the time under the test hypothesis.—No! The P-value refers not only to what we observed, but also observations *more extreme* than what we observed (where "extremity" is measured in a particular way). And again, the P-value refers to a data frequency when all the assumptions used to compute it are correct. In addition to the test hypothesis, these assumptions include randomness in sampling, treatment assignment, loss, and missingness, as well as an assumption that the P-value was not selected for presentation based on its size or some other aspect of the results.

10. If you reject the test hypothesis because P ≤ 0.05, the chance you are in error (the chance your "significant finding" is a false positive) is 5%.—No! To see why this description is false, suppose the test hypothesis is in fact true. Then, if you reject it, the chance you are in error is 100%, not 5%. The 5% refers only to how often you would reject it, and therefore be in error, over very many uses of the test across different studies when the test hypothesis and all other assumptions used for the test are true. It does not refer to your single use of the test, which may have been thrown off by assumption violations as well as random errors. This is yet another version of misinterpretation #1.

11. P = 0.05 and P ≤ 0.05 mean the same thing.—No! This is like saying reported height = 2 meters and reported height ≤ 2 meters are the same thing: "height = 2 meters" would include few people and those people would be considered tall, whereas "height ≤ 2 meters" would include most people including small children. Similarly, P = 0.05 would be considered a borderline result in terms of statistical significance, whereas P ≤ 0.05 lumps borderline results together with results very incompatible with the model (e.g., P = 0.0001) thus rendering its meaning vague, for no good purpose.

12. P-values are properly reported as inequalities (e.g., report "P < 0.02" when P = 0.015 or report P > 0.05 when P = 0.06 or P = 0.70).—No! This is bad practice because it makes it difficult or impossible for the reader to accurately interpret the statistical result. Only when the P-value is very small (e.g., under 0.001) does an inequality become justifiable: There is little practical difference among very small P-values when the assumptions used to compute P-values are not known with enough certainty to justify such precision, and most methods for computing P-values are not numerically accurate below a certain point.

13. Statistical significance is a property of the phenomenon being studied, and thus statistical tests detect significance.—No! This misinterpretation is promoted when researchers state that they have or have not found "evidence of" a statistically significant effect. The effect being tested either exists or does not exist. "Statistical significance" is a dichotomous description of a P-value (that it is below the chosen cut-off) and thus is a property of a result of a statistical test; it is not a property of the effect or population being studied.

14. One should always use two-sided P-values.—No! Two-sided P-values are designed to test hypotheses that the targeted effect measure equals a specific value (e.g., zero), and is neither above nor below this value. When however the test hypothesis of scientific or practical interest is a one-sided (dividing) hypothesis, a one-sided P-value is appropriate. For example, consider the practical question of whether a new drug is *at least* as good as the standard drug for increasing survival time. This question is one-sided, so testing this hypothesis calls for a one-sided P-value. Nonetheless, because two-sided P-values are the usual default, it will be important to note when and why a one-sided P-value is being used instead.

There are other interpretations of P values that are controversial, in that whether a categorical "No!" is warranted depends on one's philosophy of statistics and the precise meaning given to the terms involved. The disputed claims deserve recognition if one wishes to avoid such controversy.

For example, it has been argued that P-values overstate evidence against test hypotheses, based on directly comparing P-values against certain quantities (likelihood ratios and Bayes factors) that play a central role as evidence measures in Bayesian analysis (Edwards et al. 1963; Berger and Sellke 1987; Edwards 1992; Goodman and Royall 1988; Royall 1997; Sellke et al. 2001; Goodman 1992, 2005; Wagenmakers 2007). Nonetheless, many other statisticians do not accept these quantities as gold standards, and instead point out that P-values summarize crucial evidence needed to gauge the error rates of decisions based on statistical tests (even though they are far from sufficient for making those decisions). Thus, from this frequentist perspective, P-values do not overstate evidence and may even be considered as measuring one aspect of evidence (Cox 1977, 1982; Lehmann 1986; Senn 2001, 2002a; Mayo and Cox 2006), with 1 − P measuring evidence against the model used to compute the P-value. See also Murtaugh (2014) and its accompanying discussion.

Common Misinterpretations of P-Value Comparisons and Predictions

Some of the most severe distortions of the scientific literature produced by statistical testing involve erroneous comparison and synthesis of results from different studies or study subgroups. Among the worst are:

15. When the same hypothesis is tested in different studies and none or a minority of the tests are statistically significant (all P > 0.05), the overall evidence supports the hypothesis.—No! This belief is often used to claim that a literature supports no effect when the opposite is case. It reflects a tendency of researchers to "overestimate the power of most research" (Hedges and Olkin 1980). In reality, every study could fail to reach statistical significance and yet when combined show a statistically significant association and persuasive evidence of an effect. For example, if there were five studies each with P = 0.10, none would be significant at 0.05 level; but when these P-values are combined using the Fisher formula (Cox and Hinkley 1974, p. 80), the overall P-value would be 0.01. There are many real ex-

amples of persuasive evidence for important effects when few studies or even no study reported "statistically significant" associations (e.g., Chalmers and Lau 1996; Maheshwari et al. 2007). Thus, lack of statistical significance of individual studies should not be taken as implying that the totality of evidence supports no effect.

16. When the same hypothesis is tested in two different populations and the resulting P-values are on opposite sides of 0.05, the results are conflicting.—No! Statistical tests are sensitive to many differences between study populations that are irrelevant to whether their results are in agreement, such as the sizes of compared groups in each population. As a consequence, two studies may provide very different *P*-values for the same test hypothesis and yet be in perfect agreement (e.g., may show identical observed associations). For example, suppose we had two randomized trials A and B of a treatment, identical except that trial A had a known standard error of 2 for the mean difference between treatment groups whereas trial B had a known standard error of 1 for the difference. If both trials observed a difference between treatment groups of exactly 3, the usual normal test would produce $P = 0.13$ in A but $P = 0.003$ in B. Despite their difference in *P*-values, the test of the hypothesis of no difference in effect across studies would have $P = 1$, reflecting the perfect agreement of the observed mean differences from the studies. Differences between results must be evaluated by directly, for example by estimating and testing those differences to produce a confidence interval and a *P*-value comparing the results (often called analysis of heterogeneity, interaction, or modification).

17. When the same hypothesis is tested in two different populations and the same P-values are obtained, the results are in agreement.—No! Again, tests are sensitive to many differences between populations that are irrelevant to whether their results are in agreement. Two different studies may even exhibit identical *P*-values for testing the same hypothesis yet also exhibit clearly different observed associations. For example, suppose randomized experiment A observed a mean difference between treatment groups of 3.00 with standard error 1.00, while B observed a mean difference of 12.00 with standard error 4.00. Then the standard normal test would produce $P = 0.003$ in both; yet the test of the hypothesis of no difference in effect across studies gives $P = 0.03$, reflecting the large difference $(12.00 - 3.00 = 9.00)$ between the mean differences.

18. If one observes a small P-value, there is a good chance that the next study will produce a P-value at least as small for the same hypothesis.—No! This is false even under the ideal condition that both studies are independent and all assumptions including the test hypothesis are correct in both studies. In that case, if (say) one observes $P = 0.03$, the chance that the new study will show $P \leq 0.03$ is only 3%; thus the chance the new study will show a *P*-value as small or smaller (the "replication probability") is exactly the observed *P*-value! If on the other hand the small *P*-value arose solely because the true effect exactly equaled its observed estimate, there would be a 50% chance that a repeat experiment of identical design would have

a larger *P*-value (Goodman 1992). In general, the size of the new *P*-value will be extremely sensitive to the study size and the extent to which the test hypothesis or other assumptions are violated in the new study (Senn 2002a); in particular, *P* may be very small or very large depending on whether the study and the violations are large or small.

Finally, although it is (we hope obviously) wrong to do so, one sometimes sees the null hypothesis compared with another (alternative) hypothesis using a two-sided *P*-value for the null and a one-sided *P*-value for the alternative. This comparison is biased in favor of the null in that the two-sided test will falsely reject the null only half as often as the one-sided test will falsely reject the alternative (again, under all the assumptions used for testing).

Common Misinterpretations of Confidence Intervals

Most of the above misinterpretations translate into an analogous misinterpretation for confidence intervals. For example, another misinterpretation of $P > 0.05$ is that it means the test hypothesis has only a 5% chance of being false, which in terms of a confidence interval becomes the common fallacy:

19. The specific 95% confidence interval presented by a study has a 95% chance of containing the true effect size.—No! A reported confidence interval is a range between two numbers. The frequency with which an observed interval (e.g., 0.72 to 2.88) contains the true effect is either 100% if the true effect is within the interval or 0% if not; the 95% refers only to how often 95% confidence intervals computed from very many studies would contain the true size *if all the assumptions used to compute the intervals were correct*. It is possible to compute an interval that can be interpreted as having 95% probability of containing the true value; nonetheless, such computations require not only the assumptions used to compute the confidence interval, but also further assumptions about the size of effects in the model. These further assumptions are summarized in what is called a *prior distribution*, and the resulting intervals are usually called *Bayesian posterior (or credible) intervals* to distinguish them from confidence intervals (e.g., see Rothman et al. 2008, Ch. 13 and 18).

Symmetrically, the misinterpretation of a small *P*-value as disproving the test hypothesis could be translated into:

20. An effect size outside the 95% confidence interval has been refuted (or excluded) by the data.—No! As with the *P*-value, the confidence interval is computed from many assumptions, the violation of which may have led to the results. Thus it is the combination of the data with the assumptions, along with the arbitrary 95% criterion, that are needed to declare an effect size outside the interval is in some way incompatible with the observations. Even then, judgements as extreme as saying the effect size has been refuted or excluded will require even stronger conditions.

As with *P*-values, nave comparison of confidence intervals

can be highly misleading:

21. If two confidence intervals overlap, the difference between two estimates or studies is not significant.—No! The 95% confidence intervals from two subgroups or studies may overlap substantially and yet the test for difference between them may still produce $P < 0.05$. Suppose for example, two 95% confidence intervals for means from normal populations with known variances are (1.04, 4.96) and (4.16, 19.84); these intervals overlap, yet the test of the hypothesis of no difference in effect across studies gives $P = 0.03$. As with P-values, comparison between groups requires statistics that directly test and estimate the differences across groups. It can, however, be noted that if the two 95% confidence intervals fail to overlap, then when using the same assumptions used to compute the confidence intervals we will find $P < 0.05$ for the difference; and if one of the 95% intervals contains the point estimate from the other group or study, we will find $P > 0.05$ for the difference.

Finally, as with P-values, the replication properties of confidence intervals are usually misunderstood:

22. An observed 95% confidence interval predicts that 95% of the estimates from future studies will fall inside the observed interval.—No! This statement is wrong in several ways. Most importantly, under the model, 95% is the frequency with which *other unobserved* intervals will contain the *true effect*, not how frequently the one interval being presented will contain future estimates. In fact, even under ideal conditions the chance that a future estimate will fall within the current interval will usually be much less than 95%. For example, if two independent studies of the same quantity provide unbiased normal point estimates with the same standard errors, the chance that the 95% confidence interval for the first study contains the point estimate from the second is 83% (which is the chance that the difference between the two estimates is less than 1.96 standard errors). Again, an observed interval either does or does not contain the true effect; the 95% refers only to how often 95% confidence intervals computed from very many studies would contain the true effect if all the assumptions used to compute the intervals were correct.

23. If one 95% confidence interval includes the null value and another excludes that value, the interval excluding the null is the more precise one.—No! When the model is correct, precision of statistical estimation is measured directly by confidence interval *width* (measured on the appropriate scale). It is not a matter of inclusion or exclusion of the null or any other value. Consider two 95% confidence intervals for a difference in means, one with limits of 5 and 40, the other with limits of −5 and 10. The first interval excludes the null value of 0, but is 30 units wide. The second includes the null value, but is half as wide and therefore much more precise.

In addition to the above misinterpretations, 95% confidence intervals force the 0.05-level cutoff on the reader, lumping together all effect sizes with $P > 0.05$, and in this way are as bad as presenting P-values as dichotomies. Nonetheless, many

authors agree that confidence intervals are superior to tests and P-values because they allow one to shift focus away from the null hypothesis, toward the full range of effect sizes compatible with the data—a shift recommended by many authors and a growing number of journals. Another way to bring attention to nonnull hypotheses is to present their P-values; for example, one could provide or demand P-values for those effect sizes that are recognized as scientifically reasonable alternatives to the null.

As with P-values, further cautions are needed to avoid misinterpreting confidence intervals as providing sharp answers when none are warranted. The hypothesis which says the point estimate is the correct effect will have the largest P-value ($P = 1$ in most cases), and hypotheses inside a confidence interval will have higher P-values than hypotheses outside the interval. The P-values will vary greatly, however, among hypotheses inside the interval, as well as among hypotheses on the outside. Also, two hypotheses may have nearly equal P-values even though one of the hypotheses is inside the interval and the other is outside. Thus, if we use P-values to measure compatibility of hypotheses with data and wish to compare hypotheses with this measure, we need to examine their P-values directly, not simply ask whether the hypotheses are inside or outside the interval. This need is particularly acute when (as usual) one of the hypotheses under scrutiny is a null hypothesis.

Common Misinterpretations of Power

The *power* of a test to detect a correct alternative hypothesis is the pre-study probability that the test will reject the test hypothesis (e.g., the probability that P will not exceed a prespecified cut-off such as 0.05). (The corresponding prestudy probability of failing to reject the test hypothesis when the alternative is correct is one minus the power, also known as the Type-II or beta error rate; see Lehmann 1986.) As with P-values and confidence intervals, this probability is defined over repetitions of the same study design and so is a frequency probability. One source of reasonable alternative hypotheses are the effect sizes that were used to compute power in the study proposal. Prestudy power calculations do not, however, measure the compatibility of these alternatives with the data actually observed, while power calculated from the observed data is a direct (if obscure) transformation of the null P-value and so provides no test of the alternatives. Thus, presentation of power does not obviate the need to provide interval estimates and direct tests of the alternatives.

For these reasons, many authors have condemned use of power to interpret estimates and statistical tests (e.g., Cox 1958; Smith and Bates 1992; Goodman 1994; Goodman and Berlin 1994; Hoenig and Heisey 2001; Senn 2002b; Greenland 2012a), arguing that (in contrast to confidence intervals) it distracts attention from direct comparisons of hypotheses and introduces new misinterpretations, such as:

24. If you accept the null hypothesis because the null P-value exceeds 0.05 and the power of your test is 90%, the chance you are in error (the chance that your finding is a false negative) is 10%.—No! If the null hypothesis is false and you accept

it, the chance you are in error is 100%, not 10%. Conversely, if the null hypothesis is true and you accept it, the chance you are in error is 0%. The 10% refers only to how often you would be in error over very many uses of the test across different studies when the particular alternative used to compute power is correct *and* all other assumptions used for the test are correct in all the studies. It does not refer to your single use of the test or your error rate under any alternative effect size other than the one used to compute power.

It can be especially misleading to compare results for two hypotheses by presenting a test or *P*-value for one and power for the other. For example, testing the null by seeing whether $P \leq 0.05$ with a power less than $1 - 0.05 = 0.95$ for the alternative (as done routinely) will bias the comparison in favor of the null because it entails a lower probability of incorrectly rejecting the null (0.05) than of incorrectly accepting the null when the alternative is correct. Thus, claims about relative support or evidence need to be based on direct and comparable measures of support or evidence for both hypotheses, otherwise mistakes like the following will occur:

25. If the null P-value exceeds 0.05 and the power of this test is 90% at an alternative, the results support the null over the alternative.—This claim seems intuitive to many, but counterexamples are easy to construct in which the null *P*-value is between 0.05 and 0.10, and yet there are alternatives whose own *P*-value exceeds 0.10 and for which the power is 0.90. Parallel results ensue for other accepted measures of compatibility, evidence, and support, indicating that the data show lower compatibility with and more evidence against the null than the alternative, despite the fact that the null *P*-value is "not significant" at the 0.05 alpha level and the power against the alternative is "very high" (Greenland, 2012a).

Despite its shortcomings for interpreting current data, power can be useful for designing studies and for understanding why replication of "statistical significance" will often fail even under ideal conditions. Studies are often designed or claimed to have 80% power against a key alternative when using a 0.05 significance level, although in execution often have less power due to unanticipated problems such as low subject recruitment. Thus, if the alternative is correct and the actual power of two studies is 80%, the chance that the studies will both show $P \leq 0.05$ will at best be only $0.80(0.80) = 64\%$; furthermore, the chance that one study shows $P \leq 0.05$ and the other does not (and thus will be misinterpreted as showing conflicting results) is $2(0.80)0.20 = 32\%$ or about 1 chance in 3. Similar calculations taking account of typical problems suggest that one could anticipate a "replication crisis" even if there were no publication or reporting bias, simply because current design and testing conventions treat individual study results as dichotomous outputs of "significant"/"nonsignificant" or "reject"/"accept."

A Statistical Model is Much More Than an Equation with Greek Letters

The above list could be expanded by reviewing the research literature. We will however turn to direct discussion of an issue that has been receiving more attention of late, yet is still widely overlooked or interpreted too narrowly in statistical teaching and presentations: That the statistical model used to obtain the results is correct.

Too often, the full statistical model is treated as a simple regression or structural equation in which effects are represented by parameters denoted by Greek letters. "Model checking" is then limited to tests of fit or testing additional terms for the model. Yet these tests of fit themselves make further assumptions that should be seen as part of the full model. For example, all common tests and confidence intervals depend on assumptions of random selection for observation or treatment and random loss or missingness within levels of controlled covariates. These assumptions have gradually come under scrutiny via sensitivity and bias analysis (e.g., Lash et al. 2014), but such methods remain far removed from the basic statistical training given to most researchers.

Less often stated is the even more crucial assumption that the analyses themselves were not guided toward finding nonsignificance or significance (analysis bias), and that the analysis results were not reported based on their nonsignificance or significance (reporting bias and publication bias). Selective reporting renders false even the limited ideal meanings of statistical significance, *P*-values, and confidence intervals. Because author decisions to report and editorial decisions to publish results often depend on whether the *P*-value is above or below 0.05, selective reporting has been identified as a major problem in large segments of the scientific literature (Dwan et al. 2013; Page et al. 2014; You et al. 2012).

Although this selection problem has also been subject to sensitivity analysis, there has been a bias in studies of reporting and publication bias: It is usually assumed that these biases favor significance. This assumption is of course correct when (as is often the case) researchers select results for presentation when $P \leq 0.05$, a practice that tends to exaggerate associations (Button et al. 2013; Eyding et al. 2010; Land 1980; Land 1981). Nonetheless, bias in favor of reporting $P \leq 0.05$ is not always plausible let alone supported by evidence or common sense. For example, one might expect selection for $P > 0.05$ in publications funded by those with stakes in acceptance of the null hypothesis (a practice which tends to understate associations); in accord with that expectation, some empirical studies have observed smaller estimates and "nonsignificance" more often in such publications than in other studies (Eyding et al. 2010; Greenland 2009; Xu et al. 2013).

Addressing such problems would require far more political will and effort than addressing misinterpretation of statistics, such as enforcing registration of trials, along with open data and analysis code from all completed studies (as in the AllTrials initiative, *http://www.alltrials.net/*). In the meantime, readers are advised to consider the entire context in which research reports are produced and appear when interpreting the statistics and conclusions offered by the reports.

Conclusions

Upon realizing that statistical tests are usually misinterpreted, one may wonder what if anything these tests do for science. They were originally intended to account for random variability as a source of error, thereby sounding a note of caution against overinterpretation of observed associations as true effects or as stronger evidence against null hypotheses than was warranted. But before long that use was turned on its head to provide fallacious support for null hypotheses in the form of "failure to achieve" or "failure to attain" statistical significance.

We have no doubt that the founders of modern statistical testing would be horrified by common treatments of their invention. In their first paper describing their binary approach to statistical testing, Neyman and Pearson (1928) wrote that "it is doubtful whether the knowledge that [a P-value] was really 0.03 (or 0.06), rather than 0.05 ... would in fact ever modify our judgment" and that "The tests themselves give no final verdict, but as tools help the worker who is using them to form his final decision." Pearson (1955) later added, "No doubt we could more aptly have said, 'his final or provisional decision'." Fisher (1956, p. 42) went further, saying "No scientific worker has a fixed level of significance at which from year to year, and in all circumstances, he rejects hypotheses; he rather gives his mind to each particular case in the light of his evidence and his ideas." Yet fallacious and ritualistic use of tests continued to spread, including beliefs that whether P was above or below 0.05 was a universal arbiter of discovery. Thus by 1965, Hill (1965) lamented that "too often we weaken our capacity to interpret data and to take reasonable decisions whatever the value of P. And far too often we deduce 'no difference' from 'no significant difference'."

In response, it has been argued that some misinterpretations are harmless in tightly controlled experiments on well-understood systems, where the test hypothesis may have special support from established theories (e.g., Mendelian genetics) and in which every other assumption (such as random allocation) is forced to hold by careful design and execution of the study. But it has long been asserted that the harms of statistical testing in more uncontrollable and amorphous research settings (such as social-science, health, and medical fields) have far outweighed its benefits, leading to calls for banning such tests in research reports—again, with one journal banning confidence intervals as well as P-values (Trafimow and Marks 2015).

Given, however, the deep entrenchment of statistical testing, as well as the absence of generally accepted alternative methods, there have been many attempts to salvage P-values by detaching them from their use in significance tests. One approach is to focus on P-values as continuous measures of compatibility, as described earlier. Although this approach has its own limitations (as described in points 1, 2, 5, 9, 17, and 18), it avoids misconceptions arising from comparison of P-values with arbitrary cutoffs such as 0.05 (as described in points 3, 4, 6–8, 10–13, 15, 16, 21, and 23–25). Another approach is to teach and use correct relations of P-values to hypothesis probabilities. For example, under common statistical models, one-sided P-values can provide lower bounds on probabilities for hypotheses about effect directions (Casella and Berger 1987ab; Greenland and

Poole 2013ab). Whether such reinterpretations can eventually replace common misinterpretations to good effect remains to be seen.

A shift in emphasis from hypothesis testing to estimation has been promoted as a simple and relatively safe way to improve practice (Yates 1951; Rothman 1978; Altman et al. 2000; Poole 2001; Cumming 2011), resulting in increasing use of confidence intervals and editorial demands for them; nonetheless, this shift has brought to the fore misinterpretations of intervals such as 19–23 above (Morey et al. 2015). Other approaches combine tests of the null with further calculations involving both null and alternative hypotheses (Rosenthal and Rubin 1994; Mayo and Spanos 2006); such calculations may, however, may bring with them further misinterpretations similar to those described above for power, as well as greater complexity.

Meanwhile, in the hopes of minimizing harms of current practice, we can offer several guidelines for users and readers of statistics, and re-emphasize some key warnings from our list of misinterpretations:

a) Correct and careful interpretation of statistical tests demands examining the sizes of effect estimates and confidence limits, as well as precise P-values (not just whether P-values are above or below 0.05 or some other threshold).

b) Careful interpretation also demands critical examination of the assumptions and conventions used for the statistical analysis—not just the usual statistical assumptions, but also the hidden assumptions about how results were generated and chosen for presentation.

c) It is simply false to claim that statistically nonsignificant results support a test hypothesis, because the same results may be even more compatible with alternative hypotheses—even if the power of the test is high for those alternatives.

d) Interval estimates aid in evaluating whether the data are capable of discriminating among various hypotheses about effect sizes, or whether statistical results have been misrepresented as supporting one hypothesis when those results are better explained by other hypotheses (see points 4–6). We caution however that confidence intervals are often only a first step in these tasks. To compare hypotheses in light of the data and the statistical model it may be necessary to calculate the P-value (or relative likelihood) of each hypothesis. We further caution that confidence intervals provide only a best-case measure of the uncertainty or ambiguity left by the data, insofar as they depend on an uncertain statistical model.

e) Correct statistical evaluation of multiple studies requires a pooled analysis or meta-analysis that deals correctly with study biases (Whitehead 2002; Borenstein et al. 2009; Chen and Peace 2013; Cooper et al. 2009; Greenland and O'Rourke 2008; Petitti 2000; Schmidt and Hunter 2014; Sterne 2009). Even when this is done, however, all the earlier cautions apply. Furthermore, the outcome of any statistical procedure is but one of many considerations that must be evaluated when examining the totality of evidence. In

particular, statistical significance is neither necessary nor sufficient for determining the scientific or practical significance of a set of observations. This view was affirmed unanimously by the U.S. Supreme Court, (Matrixx Initiatives, Inc., et al. v. Siracusano et al. No. 091156. Argued January 10, 2011, Decided March 22, 2011), and can be seen in our earlier quotes from Neyman and Pearson.

f) Any opinion offered about the *probability, likelihood, certainty*, or similar property for a hypothesis *cannot* be derived from statistical methods alone. In particular, significance tests and confidence intervals do not by themselves provide a logically sound basis for concluding an effect is present or absent with certainty or a given probability. This point should be borne in mind whenever one sees a conclusion framed as a statement of probability, likelihood, or certainty about a hypothesis. Information about the hypothesis beyond that contained in the analyzed data and in conventional statistical models (which give only data probabilities) must be used to reach such a conclusion; that information should be explicitly acknowledged and described by those offering the conclusion. Bayesian statistics offers methods that attempt to incorporate the needed information directly into the statistical model; they have not however achieved the popularity of *P*-values and confidence intervals, in part because of philosophical objections and in part because no conventions have become established for their use.

g) All statistical methods (whether frequentist or Bayesian, or for testing or estimation, or for inference or decision) make extensive assumptions about the sequence of events that led to the results presented—not only in the data generation, but in the analysis choices. Thus, to allow critical evaluation, research reports (including meta-analyses) should describe in detail the full sequence of events that led to the statistics presented, including the motivation for the study, its design, the original analysis plan, the criteria used to include and exclude subjects (or studies) and data, and a thorough description of all the analyses that were conducted.

In closing, we note that no statistical method is immune to misinterpretation and misuse, but prudent users of statistics will avoid approaches especially prone to serious abuse. In this regard, we join others in singling out the degradation of *P*-values into "significant" and "nonsignificant" as an especially pernicious statistical practice (Weinberg 2001).

The ASA's Statement on p-Values: Context, Process, and Purpose

Ronald L. Wasserstein & Nicole A. Lazar

Taylor & Francis
Taylor & Francis Group

EDITORIAL

The ASA's Statement on *p*-Values: Context, Process, and Purpose

In February 2014, George Cobb, Professor Emeritus of Mathematics and Statistics at Mount Holyoke College, posed these questions to an ASA discussion forum:

Q: Why do so many colleges and grad schools teach $p = 0.05$?
A: Because that's still what the scientific community and journal editors use.
Q: Why do so many people still use $p = 0.05$?
A: Because that's what they were taught in college or grad school.

Cobb's concern was a long-worrisome circularity in the sociology of science based on the use of bright lines such as $p < 0.05$: "We teach it because it's what we do; we do it because it's what we teach." This concern was brought to the attention of the ASA Board.

The ASA Board was also stimulated by highly visible discussions over the last few years. For example, ScienceNews (Siegfried 2010) wrote: "It's science's dirtiest secret: The 'scientific method' of testing hypotheses by statistical analysis stands on a flimsy foundation." A November 2013, article in Phys.org Science News Wire (2013) cited "numerous deep flaws" in null hypothesis significance testing. A ScienceNews article (Siegfried 2014) on February 7, 2014, said "statistical techniques for testing hypotheses …have more flaws than Facebook's privacy policies." A week later, statistician and "Simply Statistics" blogger Jeff Leek responded. "The problem is not that people use P-values poorly," Leek wrote, "it is that the vast majority of data analysis is not performed by people properly trained to perform data analysis" (Leek 2014). That same week, statistician and science writer Regina Nuzzo published an article in *Nature* entitled "Scientific Method: Statistical Errors" (Nuzzo 2014). That article is now one of the most highly viewed *Nature* articles, as reported by altmetric.com (http://www.altmetric.com/details/2115792#score).

Of course, it was not simply a matter of responding to some articles in print. The statistical community has been deeply concerned about issues of *reproducibility* and *replicability* of scientific conclusions. Without getting into definitions and distinctions of these terms, we observe that much confusion and even doubt about the validity of science is arising. Such doubt can lead to radical choices, such as the one taken by the editors of *Basic and Applied Social Psychology*, who decided to ban *p*-values (null hypothesis significance testing) (Trafimow and Marks 2015). Misunderstanding or misuse of statistical inference is only one cause of the "reproducibility crisis" (Peng 2015), but to our community, it is an important one.

When the ASA Board decided to take up the challenge of developing a policy statement on *p*-values and statistical significance, it did so recognizing this was not a lightly taken step. The ASA has not previously taken positions on specific matters of statistical practice. The closest the association has come to this is a statement on the use of value-added models (VAM) for educational assessment (Morganstein and Wasserstein

2014) and a statement on risk-limiting post-election audits (American Statistical Association 2010). However, these were truly policy-related statements. The VAM statement addressed a key educational policy issue, acknowledging the complexity of the issues involved, citing limitations of VAMs as effective performance models, and urging that they be developed and interpreted with the involvement of statisticians. The statement on election auditing was also in response to a major but specific policy issue (close elections in 2008), and said that statistically based election audits should become a routine part of election processes.

By contrast, the Board envisioned that the ASA statement on *p*-values and statistical significance would shed light on an aspect of our field that is too often misunderstood and misused in the broader research community, and, in the process, provides the community a service. The intended audience would be researchers, practitioners, and science writers who are not primarily statisticians. Thus, this statement would be quite different from anything previously attempted.

The Board tasked Wasserstein with assembling a group of experts representing a wide variety of points of view. On behalf of the Board, he reached out to more than two dozen such people, all of whom said they would be happy to be involved. Several expressed doubt about whether agreement could be reached, but those who did said, in effect, that if there was going to be a discussion, they wanted to be involved.

Over the course of many months, group members discussed what format the statement should take, tried to more concretely visualize the audience for the statement, and began to find points of agreement. That turned out to be relatively easy to do, but it was just as easy to find points of intense disagreement.

The time came for the group to sit down together to hash out these points, and so in October 2015, 20 members of the group met at the ASA Office in Alexandria, Virginia. The 2-day meeting was facilitated by Regina Nuzzo, and by the end of the meeting, a good set of points around which the statement could be built was developed.

The next 3 months saw multiple drafts of the statement, reviewed by group members, by Board members (in a lengthy discussion at the November 2015 ASA Board meeting), and by members of the target audience. Finally, on January 29, 2016, the Executive Committee of the ASA approved the statement.

The statement development process was lengthier and more controversial than anticipated. For example, there was considerable discussion about how best to address the issue of multiple *potential* comparisons (Gelman and Loken 2014). We debated at some length the issues behind the words "a *p*-value near 0.05 taken by itself offers only weak evidence against the null

hypothesis" (Johnson 2013). There were differing perspectives about how to characterize various alternatives to the *p*-value and in how much detail to address them. To keep the statement reasonably simple, we did not address alternative hypotheses, error types, or power (among other things), and not everyone agreed with that approach.

As the end of the statement development process neared, Wasserstein contacted Lazar and asked if the policy statement might be appropriate for publication in *The American Statistician* (*TAS*). After consideration, Lazar decided that *TAS* would provide a good platform to reach a broad and general statistical readership. Together, we decided that the addition of an online discussion would heighten the interest level for the *TAS* audience, giving an opportunity to reflect the aforementioned controversy.

To that end, a group of discussants was contacted to provide comments on the statement. You can read their statements in the online supplement, and a guide to those statements appears at the end of this editorial. We thank Naomi Altman, Douglas Altman, Daniel J. Benjamin, Yoav Benjamini, Jim Berger, Don Berry, John Carlin, George Cobb, Andrew Gelman, Steve Goodman, Sander Greenland, John Ioannidis, Joseph Horowitz, Valen Johnson, Michael Lavine, Michael Lew, Rod Little, Deborah Mayo, Michele Millar, Charles Poole, Ken Rothman, Stephen Senn, Dalene Stangl, Philip Stark and Steve Ziliak for sharing their insightful perspectives.

Of special note is the following article, which is a significant contribution to the literature about *p*-values and statistical significance.

> Greenland, S., Senn, S.J., Rothman, K.J., Carlin, J.B., Poole, C., Goodman, S.N. and Altman, D.G.: "Statistical Tests, *P*-values, Confidence Intervals, and Power: A Guide to Misinterpretations."

Though there was disagreement on exactly what the statement should say, there was high agreement that the ASA should be speaking out about these matters.

Let us be clear. Nothing in the ASA statement is new. Statisticians and others have been sounding the alarm about these matters for decades, to little avail. We hoped that a statement from the world's largest professional association of statisticians would open a fresh discussion and draw renewed and vigorous attention to changing the practice of science with regards to the use of statistical inference.

Guide to the Online Supplemental Material to the ASA Statement on *P*-Values and Statistical Significance

Many of the participants in the development of the ASA statement contributed commentary about the statement or matters related to it. Their comments are posted as online supplements to the statement. We provide here a list of the supplemental articles.

ASA Statement on Statistical Significance and *P*-Values

1. Introduction

Increased quantification of scientific research and a proliferation of large, complex datasets in recent years have expanded the scope of applications of statistical methods. This has created new avenues for scientific progress, but it also brings concerns about conclusions drawn from research data. The validity of scientific conclusions, including their reproducibility, depends on more than the statistical methods themselves. Appropriately chosen techniques, properly conducted analyses and correct interpretation of statistical results also play a key role in ensuring that conclusions are sound and that uncertainty surrounding them is represented properly.

Underpinning many published scientific conclusions is the concept of "statistical significance," typically assessed with an index called the *p*-value. While the *p*-value can be a useful statistical measure, it is commonly misused and misinterpreted. This has led to some scientific journals discouraging the use of *p*-values, and some scientists and statisticians recommending their abandonment, with some arguments essentially unchanged since *p*-values were first introduced.

In this context, the American Statistical Association (ASA) believes that the scientific community could benefit from a formal statement clarifying several widely agreed upon principles underlying the proper use and interpretation of the *p*-value. The issues touched on here affect not only research, but research funding, journal practices, career advancement, scientific education, public policy, journalism, and law. This statement does not seek to resolve all the issues relating to sound statistical practice, nor to settle foundational controversies. Rather, the statement articulates in nontechnical terms a few select principles that could improve the conduct or interpretation of quantitative science, according to widespread consensus in the statistical community.

2. What is a *p*-Value?

Informally, a *p*-value is the probability under a specified statistical model that a statistical summary of the data (e.g., the sample mean difference between two compared groups) would be equal to or more extreme than its observed value.

3. Principles

1. **P-values can indicate how incompatible the data are with a specified statistical model.**

    A *p*-value provides one approach to summarizing the incompatibility between a particular set of data and a proposed model for the data. The most common context is a model, constructed under a set of assumptions, together with a so-called "null hypothesis." Often the null hypothesis postulates the absence of an effect, such as no difference between two groups, or the absence of a relationship between a factor and an outcome. The smaller the *p*-value, the greater the statistical incompatibility of the data with the null hypothesis, if the underlying assumptions used to calculate the *p*-value hold. This incompatibility can be interpreted as casting doubt on or providing evidence against the null hypothesis or the underlying assumptions.

2. **P-values do not measure the probability that the studied hypothesis is true, or the probability that the data were produced by random chance alone.**

    Researchers often wish to turn a *p*-value into a statement about the truth of a null hypothesis, or about the probability that random chance produced the observed data. The *p*-value is neither. It is a statement about data in relation to a specified hypothetical explanation, and is not a statement about the explanation itself.

3. **Scientific conclusions and business or policy decisions should not be based only on whether a *p*-value passes a specific threshold.**

    Practices that reduce data analysis or scientific inference to mechanical "bright-line" rules (such as "*p* < 0.05") for justifying scientific claims or conclusions can lead to erroneous beliefs and poor decision making. A conclusion does not immediately become "true" on one side of the divide and "false" on the other. Researchers should bring many contextual factors into play to derive scientific inferences, including the design of a study, the quality of the measurements, the external evidence for the phenomenon under study, and the validity of assumptions that underlie the data analysis. Pragmatic considerations often require binary, "yes-no" decisions, but this does not mean that *p*-values alone can ensure that a decision is correct or incorrect. The widespread use of "statistical significance" (generally interpreted as "*p* ≤ 0.05") as a license for making a claim of a scientific finding (or implied truth) leads to considerable distortion of the scientific process.

4. **Proper inference requires full reporting and transparency**

    P-values and related analyses should not be reported selectively. Conducting multiple analyses of the data and reporting only those with certain *p*-values (typically those passing a significance threshold) renders the

reported *p*-values essentially uninterpretable. Cherry-picking promising findings, also known by such terms as data dredging, significance chasing, significance questing, selective inference, and "*p*-hacking," leads to a spurious excess of statistically significant results in the published literature and should be vigorously avoided. One need not formally carry out multiple statistical tests for this problem to arise: Whenever a researcher chooses what to present based on statistical results, valid interpretation of those results is severely compromised if the reader is not informed of the choice and its basis. Researchers should disclose the number of hypotheses explored during the study, all data collection decisions, all statistical analyses conducted, and all *p*-values computed. Valid scientific conclusions based on *p*-values and related statistics cannot be drawn without at least knowing how many and which analyses were conducted, and how those analyses (including *p*-values) were selected for reporting.

5. **A *p*-value, or statistical significance, does not measure the size of an effect or the importance of a result.**

Statistical significance is not equivalent to scientific, human, or economic significance. Smaller *p*-values do not necessarily imply the presence of larger or more important effects, and larger *p*-values do not imply a lack of importance or even lack of effect. Any effect, no matter how tiny, can produce a small *p*-value if the sample size or measurement precision is high enough, and large effects may produce unimpressive *p*-values if the sample size is small or measurements are imprecise. Similarly, identical estimated effects will have different *p*-values if the precision of the estimates differs.

6. **By itself, a *p*-value does not provide a good measure of evidence regarding a model or hypothesis.**

Researchers should recognize that a *p*-value without context or other evidence provides limited information. For example, a *p*-value near 0.05 taken by itself offers only weak evidence against the null hypothesis. Likewise, a relatively large *p*-value does not imply evidence in favor of the null hypothesis; many other hypotheses may be equally or more consistent with the observed data. For these reasons, data analysis should not end with the calculation of a *p*-value when other approaches are appropriate and feasible.

4. Other Approaches

In view of the prevalent misuses of and misconceptions concerning *p*-values, some statisticians prefer to supplement or even replace *p*-values with other approaches. These include methods that emphasize estimation over testing, such as confidence, credibility, or prediction intervals; Bayesian methods; alternative measures of evidence, such as likelihood ratios or Bayes Factors; and other approaches such as decision-theoretic modeling and false discovery rates. All these measures and approaches rely on further assumptions, but they may more directly address the size of an effect (and its associated uncertainty) or whether the hypothesis is correct.

5. Conclusion

Good statistical practice, as an essential component of good scientific practice, emphasizes principles of good study design and conduct, a variety of numerical and graphical summaries of data, understanding of the phenomenon under study, interpretation of results in context, complete reporting and proper logical and quantitative understanding of what data summaries mean. No single index should substitute for scientific reasoning.

Acknowledgments

General Comment

Thank you for this opportunity to address the challenges faced by the Commission on Evidence-Based Policymaking and to share my views on what the Commission may realistically hope to accomplish. My comments, attached here, draw on the statement that my colleagues and I prepared, "From Data to Evidence to Policy," as well as on my long experience as an analyst of large-scale data sets from administrative records, survey studies, and field experiments.

Ron Haskins
Co-Chair, Commission on Evidence-Based Policymaking
The Brookings Institution
1775 Massachusetts Ave., NW
Washington, DC 20036

Dear Katharine and Ron,

Thank you for this opportunity to address the challenges faced by the Commission on Evidence-Based Policymaking and to share my views on what the Commission may realistically hope to accomplish. My comments draw on the statement that my colleagues and I prepared, *From Data to Evidence to Policy*, as well as on my long experience as an analyst of large-scale data sets from administrative records, survey studies, and field experiments.

In our statement, we offer four recommendations to the Commission:

- Adopt a broad reading of the Commission's mandate to include not just linking and sharing administrative data, but preparing data for use by researchers inside and outside of government.
- Advance a framework that recognizes different forms of evidence and varied uses of linked administrative data.
- Recommend ways to strengthen the federal infrastructure for producing research evidence that can inform policymaking.
- Recommend to federal agencies that they support partnerships between researchers and policymakers to enhance the use of research evidence for smart policy decisions.

In this letter, I will identify three specific goals to which the Commission may aspire that would respond to these recommendations and the Commission's mandate.

1. **Devise a standardized process for linking administrative data across federal government agencies, and between federal agencies and willing state partners, that protects the privacy of individuals while facilitating research.**

    Many proof cases exist that demonstrate the feasibility of producing valuable research evidence by linking federal administrative data to surveys, experimental data, or other administrative records. Moreover, we know that the data can be linked in secure facilities using protected identity codes that ensure privacy. At present, however, each researcher using the data must start the process anew, which poses nearly impassible barriers for researchers and unreasonable burdens on federal agencies and state partners. The Commission can address these challenges by identifying an approach, or a set of approaches, that allows researchers to access and use data routinely, in secure facilities, while also satisfying the technical demands of privacy protection.

Page 2

One example that may guide the Commission in this regard comes from the experience of the National Center for Education Statistics, which planned a new longitudinal survey with oversamples in ten states whose education agencies had agreed in principle to link their administrative data to the surveys. This would have created a valuable new resource for addressing critical education policy questions, yet bureaucratic and legal barriers ultimately prevented data sharing by any of the ten states. The Commission can overcome such barriers with a framework that articulates the technical requirements, legal standing, and accepted procedures for linking and sharing data across federal agencies and with willing state partners.

In providing a framework to standardize data sharing, the Commission can specify the different types of data that may be linked—including administrative, survey, and experimental data—and the different purposes of such linkages, including program continuation decisions, program improvement plans, and obtaining accurate understanding of the nature of challenges we face as a nation (such as the link between geography and economic mobility as demonstrated in recent testimony to the Commission by Raj Chetty).

The Commission might further recommend a pilot that would begin with specific agencies that, based on the investigations of the Commission, seem best prepared to implement a standardized procedure for linking data and making them accessible to researchers inside and outside of government. For instance, Chapin Hall at the University of Chicago, with support from the Laura and John Arnold Foundation and in partnership with the U.S. Census Bureau, is sponsoring a series of studies to demonstrate innovative approaches to linking administrative data, and the Commission might look to these studies as examples.

2. **Recommend specific infrastructure elements that the federal government may adopt to support the use of evidence in policymaking.**

The Commission's mandate includes not only a directive to recommend ways to link and share administrative data, but also a call for guidance on ways that data may be used to create evidence that can guide policy. The Commission can respond to this challenge by examining infrastructure supports that are found in various agencies, identifying best practices, and recommending their wide adoption. Examples of such infrastructure elements include:

- leadership positions focused on evidence use, such as the special advisor for evidence-based policy in OMB and the chief technology officer in OSTP;
- interagency collaborative bodies, such as the federal chief information officers council and the Committee on National Statistics of the National Academies;
- a dedicated office for research and evaluation within each federal agency, such as the office of the assistant secretary for planning and evaluation within HHS, and the office of policy development and research within HUD;
- a codified set of principles and practices for evidence use, analogous to *Principles and Practices for a Federal Statistical Agency* and *Common Guidelines for Education Research and Development*; and
- policies and legislation to prioritize programs that strengthen the use of evidence and innovation (as modeled by OMB in its FY15 budget memorandum) and facilitate data-sharing across agencies to assess and improve programs.

3. **Examine models of partnerships that support the use of research evidence in policymaking, and recommend federal support for effective partnerships.**

Page 3

All too often, evidence about effective or ineffective policies or programs has little bearing on decisions, even when the evidence is rigorous, timely, and accessible. But sustained partnerships between researchers and policymakers can improve the use of research evidence by allowing for ongoing dialogue between researchers and decision makers. Indeed, partnerships that offer a basis for trust, incentivize researchers to address questions that really matter, and create a culture of evidence in the decision-making body can improve the use of research evidence in policy and practice.

The Commission can improve such use by identifying effective partnership models and promoting them across the federal government. Many models of partnerships exist, such as those outlined by the William T. Grant Foundation and the Forum for Youth Investment in their online guide for building and sustaining partnerships in education, located here: rpp.wtgrantfoundation.org.

Of course, these goals will not be achieved simply. But the Commission on Evidence-Based Policymaking is a rare and unique opportunity with tremendous potential, and we believe that the scale of this potential warrants equally ambitious goals. I would be pleased to discuss these recommendations and the specific strategies for achieving them, individually or with the Commission as a whole, if that would be helpful.

Sincerely,
Adam Gamoran, President

From Data to Evidence to Policy

Recommendations for the Commission on Evidence-Based Policymaking

MAY, 2016

The William T. Grant Foundation

The William T. Grant Foundation supports research to improve the lives of young people ages 5–25 in the United States. Our goal is to accumulate a body of knowledge that will advance theory, policy, and practice and contribute to improved outcomes and opportunities for youth, today and in the future. In 2014, we launched an initiative to invest in research to identify effective responses to inequality in its many forms. And since 2009, we have supported studies that provide insight into how policymakers, administrators, and service providers acquire, interpret, and use research evidence. In 2015, we signaled a new direction in this initiative, calling for studies that identify, create, and test strategies to improve the use of research evidence in ways that benefit youth.

The Forum for Youth Investment

The Forum for Youth Investment is a nonprofit, nonpartisan "action tank" dedicated to helping communities and the nation make sure all young people are Ready by 21®: ready for college, work and life. A trusted resource for policy makers, advocates, researchers and program professionals, the Forum provides youth and adult leaders with the information, connections and tools they need to create greater opportunities and outcomes for young people. The Forum manages a number of centers and projects, including Big Picture Approach Consulting, the David P. Weikart Center for Youth Program Quality, the Children's Cabinet Network and SparkAction. The core work of the Forum is helping leaders, organizations, partnerships and systems – at the local, state and national levels – assess, improve and align their practices and policies.

From Data to Evidence to Policy
Recommendations for the Commission on Evidence-Based Policymaking

The Forum for Youth Investment and the William T. Grant Foundation are pleased to submit the following recommendations to the Commission on Evidence-Based Policymaking. We are encouraged by the Commission's potential to promote the use of research evidence in policymaking, and we offer these insights with the hope of helping the Commission make the most of its historic opportunity.

These suggestions are drawn from our experience as conveners of a learning group of senior career staff and appointees in research offices focused on children, youth, and families within the U.S. Departments of Education, Labor, Justice, and Health and Human Services, as well as in the Corporation for National and Community Service and the National Science Foundation. These agencies invest in research and evaluation to build policy-relevant evidence and will likely be charged with implementing many of the Commission's recommendations. They also have experience responding to similar challenges in the past. For these reasons, their insights may guide the Commission in developing a transformational set of recommendations.

The Path from Data to Evidence to Policy

A narrow interpretation of the Commission on Evidence-Based Policymaking legislation might suggest the Commission's charge is primarily to determine how the federal government can share and link administrative data sets. Accomplishing this aim would be of significant value. But a broader interpretation of its charge suggests that the Commission must not stop there. It should also consider *how the federal government can use data to create the evidence required for smart policy decisions,* as well as *how to create the infrastructure to support the use of evidence in policymaking*.

We urge the Commission to prioritize those elements of its charge that point toward these broader aims:

- Emphasize how data "may be integrated and made available to facilitate program evaluation, continuous improvement, policy-relevant research, and cost-benefit analyses by qualified researchers and institutions;" and
- Examine "how data and results of research can be used to inform program administrators and policymakers to improve program design."

Sharing and linking data is necessary but not sufficient to achieve these goals. The data must be deployed in research and evaluation to create evidence, which must be then be used to inform policymaking. Laying the groundwork for the path from data to evidence to policy is essential to the Commission's charge.

Sharing and Linking Data → Using Data to Create Evidence → Using Evidence to Inform Policymaking

Sharing and Linking Data

The Commission should recommend that data are collected and shared in ways that facilitate their use in research and evaluation.

Sharing data is a valuable first step. But the data take on added power when they can be used in research and evaluation studies. The Commission can fulfill its charge of addressing "how data and results can be used to inform program administrators and policymakers" by recommending ways that administrative data systems can be made ready for use in research and evaluation. The Commission could craft recommendations that would help ensure that data are linked; are of sufficient quality; and are delivered in formats that encourage their use in research that answers policymakers' questions.

Linking separate data sets together increases the value of each for research and evaluation. One federal staff member in our learning group commented, "I am working on linking existing databases to conduct research. I need to figure out what kinds of data are being collected….Who is tracking relevant outcomes, and how do you synthesize that with community-level data from multiple sources to tell the impact of interventions across multiple domains?"

DEFINITION OF RESEARCH EVIDENCE

The William T. Grant Foundation defines research evidence as "a type of evidence derived from applying systematic methods and analyses to address a predefined question or hypothesis. This includes descriptive studies, intervention or evaluation studies, meta-analyses, and cost-effectiveness studies conducted within or outside research organizations."

Linking existing data can also enable faster and cheaper research studies. As one participant reported, "There has been a lot of thinking overall in our department on the opportunities these longitudinal data systems have for low cost evaluations. A whole group of people in our program offices are focused on this right now." But using data that are not designed for research can be challenging. Sometimes the quality of the data is poor or unknown. As a learning group participant put it, "It is not easy to figure out if a given set of administrative data is high-quality enough to be used in a research context."

Sometimes the ways that the data are shared make it difficult to produce useful research reports. As one learning group participant shared, "Only one or two people in each of our agencies know how to manipulate specific databases, and those people have a long list of requests from multiple agencies to do specific data runs. We are hoping that we can take on the burden of getting the data ready. A lot of the data we have, like those that manage case files, were not created to be used for research, so that is a heavier lift. We want to give agencies a more realistic view of the data they actually have."

Using Data to Create Evidence

The Commission should recommend that federal agencies adopt a broad and inclusive view of the types of research studies that can and should be produced with administrative data.

The power of data increases when they are used to create **research evidence** (see sidebar). Too often, however, a narrow conceptualization of data *as* evidence limits the ability of policymakers to gain full understanding of an issue. The Commission could add value to the field by advancing a framework that delineates the types of research evidence that should be created to guide policymaking.

The Commission may wish to reinforce frameworks such as the Institute of Education Sciences/National Science Foundation's *Common Guidelines for Education Research Development* framework[1] and the Health and Human Services Administration for Children and Families' *Common Framework for Research & Evaluation.*[2] Adopting these types of frameworks would help ensure that policymakers not only receive findings from the full range of types of research evidence, but review this evidence with a clear understanding of the level of rigor and quality inherent in each type of study, and what types of questions are answerable by each respective research methodology.[3]

Using Evidence to Inform Policymaking

The Commission should recommend that federal agencies support partnerships between researchers and policymakers that inform key research questions and facilitate the use of research evidence.
Partnerships between researchers and policymakers can improve the use of research evidence by guiding researchers to ask questions that respond to the needs of policymakers, building stronger practice-focused research networks or community-based participatory approaches, and creating a culture of learning in which administrators, policymakers and other government leaders include research evidence in their deliberations.

The growing literature about how and when research evidence is and is not used in policymaking can inform the Commission's work. These studies "complicate the common conception of research users as merely rational actors who have questions, go in search of research to answer them, and then apply it to their decisions…. In none of their cases does research use easily boil down to a single moment or an isolated decision….It is not a simple process whereby research 'facts' are passed from researchers to research users and then applied in a linear decision making process. Instead, research use is contingent, interactive, and iterative. It involves people individually and collectively engaging with research over time, bringing their own and their organization's goals, motivations, routines, and political contexts with them."[4] It is often helpful to construct evidence in a process of engagement, in which the needs of decision makers help shape research questions and findings are delivered in an accessible and timely fashion through relationships of trust and mutual understanding.

The Commission should recommend ways to strengthen the federal infrastructure for producing research evidence that can inform policymaking.
To address its charge to examine how data may be "made available to facilitate program evaluation, continuous improvement, policy-relevant research, and cost-benefit analyses by qualified researchers and institutions," it is important for the Commission to create recommendations for strengthening the federal infrastructure for using data to create evidence, and using that evidence to inform policymaking.

[3] While there may not yet be widely accepted quality standards for the all types of research, some of our learning group members pointed to the following article as a promising start: Gottfredson, D. C., Cook, T. D., Gardner, F. E. M., Gorman-Smith, D., Howe, G. W., Sandler, I. N., & and Zafft, K. M. (2015). Standards of evidence for efficacy, effectiveness, and scale-up research in prevention science: Next generation. *Prevention Science*, *16*, 893-926.
[4] Tseng, V. & Nutley, S. (2014). Building the Infrastructure to Improve the Use and Usefulness of Research in Education. In K.S. Finnigan & A.J. Daly (Eds.). *Using Research Evidence in Education: From the Schoolhouse Door to Capitol Hill*. Springer: New York. Available at: http://wtgrantfoundation.org/resource/building-the-infrastructure-to-improve-the-use-and-usefulness-of-research-in-education

An infrastructure could include elements such as formal policies, codified practices, established offices, and interagency coordinating structures.

Fortunately, there are existing efforts that the Commission could build upon. The Department of Labor and the Department of Health and Human Services, Administration for Children and Families both created evaluation policies that can serve as models for other agencies.[5] The Department of Labor created a Chief Evaluation Office, and conducts an annual survey to assess its performance meeting the research needs of program offices. HHS Administration for Children and Families, Office of Planning Research and Evaluation also published a set of principles to guide all of its evaluation work.[6] Further, the Institute of Education Sciences has protections, granted by Congress in its authorizing language, that support scientific integrity and independence from political influence.

Additionally, a subset of learning group participants funded a National Academy of Sciences Roundtable to consider an infrastructure for evaluation that parallels the existing infrastructure for statistical agencies. (Federal statistical agencies receive support from a Chief Statistician housed at the White House Office of Management and Budget; a public-private, interagency Committee on National Statistics; and a carefully codified and updated set of Principles and Practices for a Federal Statistical Agency.[7]) The Commission may wish to be briefed on this effort. The Commission may also wish to be briefed on the types of infrastructure that have been created to support federal agencies' performance management functions, such as the role the federal Performance Improvement Council plays in fostering widespread and effective use of performance management practices across federal agencies and sparking cross-cutting performance improvements.[8]

Conclusion

The creation of the Commission on Evidence-Based Policymaking is well timed. As shared in the William T. Grant Foundation's recent blog series *Evidence at the Crossroads*, "research evidence can improve public policies and programs, but fulfilling that potential will require honest assessments of current initiatives, coming to terms with outsized expectations, and learning ways to improve social interventions and public systems."[9]

The Commission is well positioned to drive this work forward, especially if it focuses on the full continuum of activity from sharing and linking data, to using those data to create research evidence, to using that evidence to inform policymaking.

General Comment

One simple way to vastly improve evidence-based policymaking regarding higher education would be to repeal the existing ban on a federal student unit record system. Lifting that ban would enable EXISTING data systems to communicate with one another and thereby answer critical questions that can't be answered now, especially questions about the OUTCOMES of higher education programs in which the federal government/taxpayers invest billions of dollars. These questions include: how part-time and older students fare; what happens to the large number of students who transfer from one college to another; how many and which students complete their programs at specific colleges, especially students receiving federal Pell grants ($30 billion per year); and whether graduates are able to obtain jobs that pay enough to meet their student loan obligations.

Supporters of the existing ban express say it is needed to protect student privacy. However, major higher education associations that once supported that position, notably the Association of Public and Land-grant Universities and the National Association of Student Financial Aid Administrators, now back creating a Student Unit Record. A

recent statement to CEP by New America's Rachel Fishman shows how the privacy concerns can be addressed without a ban: "Creating a Student Unit Record wold not require the collection of additional student data, but would allow the connecting of exiting data already held by a variety of federal and state agencies. Protecting these data al all points of the lifecycle is crucial, and it is worth considering housing such a system in the Department of Education's National Center for Education Statistics, which is classified as a statistical agency and therefore subject to strict privacy and security requirements..."

Some states (IN, TX) and universities are now developing their own workarounds to the ban, for they feel a keen need to obtain and share better data on student outcomes. Such initiatives are commendable, but underline the obsolescence of the ban on a federal student unit record and raise concerns about data consistency and comparability across states.

In sum, the federal government could realize and promote a much higher return on its and the country's enormous investments in higher education if there were a federal student unit record system that enabled existing data systems to realize their potential for informing more evidence-based policymaking.

Docket # USBC-2016-0003: Commission on Evidence-Based Policymaking Comments from Federal Evaluators

On September 15, 2016, members of the Federal Evaluators network met with the Executive Director and Policy and Research Director for the Commission on Evidence-Based Policymaking at the Government Accountability Office (GAO) headquarters to discuss the Commission's planned work. (Federal Evaluators is an informal network of employees in the executive and legislative branches of the U.S. federal government.) Participants came from the Departments of Agriculture, Commerce, Education, Health and Human Services, Homeland Security, Housing and Urban Development, Labor, State, Transportation, and Veterans Affairs; GAO, the Congressional Research Service; Corporation for National and Community Service; Environmental Protection Agency; Holocaust Museum; National Endowment for the Arts; National Science Foundation; Office of Management and Budget (OMB); Office of Personnel Management (OPM); Peace Corps; and Small Business Administration. To encourage candid discussion, we agreed that participants would speak for themselves, not their agencies. These comments represent the opinions of individual attendees, not necessarily all.

This summary, prepared by GAO staff, organizes the issues raised around the questions posed by the Commission in a Request for Comments posted in the Federal Register on September 14, 2016 https://www.regulations.gov/document?D=USBC-2016-0003-0001.
This summary was shared with the full Federal Evaluators membership (about 1500) for additional comments, before being submitted to the Commission. The Commission staff announced the Commission's plans to conduct additional outreach to federal agencies and hold additional public hearings, and invited members to sign up for their listserv.

#1. *Are there successful frameworks, policies, practices and methods to overcome challenges related to evidence-building from state, local and/or international governments the Commission should consider...?*
   - See the following examples for lessons learned in using state datasets: Research Data Assistance Center for access to Medicare and Medicaid program claims data http://www.resdac.org/, Education's Race to the Top state grant program http://www2.ed.gov/programs/racetothetop/index.html , GAO analysis of states' use of American Recovery and Reinvestment Act grants. http://www.gao.gov/recovery/
   - The Institute of Medicine set up a framework for quality of care that has helped health care agencies focus their efforts. One aspect of that is identifying clear policy questions to focus on. Linking data is most successful when there is a strong policy question to answer.
   - The Inter-University Consortium for Political and Social Research (ICPSR) at the University of Michigan maintains a data archive of social science research files (including federal databases) since the 1960s and provides leadership and training in data access, curation, and analysis for the research community. http://www.icpsr.umich.edu/icpsrweb/
   - The Patient-Centered Outcomes Research Institute (PCORI) has established a national network for conducting comparative clinical effectiveness research by establishing a resource of clinical data gathered and stored in standardized formats. They have worked on the legal and ethical issues involved in data release, sensitivity, and security. www.pcori.org

Submitted 10/14/2016

#4. *What data-sharing infrastructure should be used to facilitate data merging, linking, and access for research, and analysis purposes?*
-   While the formally recognized statistical agencies have principles and practices in place to facilitate data sharing, most of the Departments and smaller agencies do not, so this would require a lot of training and rulemaking for the program offices who hold the data of interest.
-   Despite a congressional mandate for all foreign assistance agencies to supply data to a foreign assistance dashboard, agencies lack the money required to change their financial systems to produce about 40 percent of the required reporting elements.
-   Agencies will need to standardize or at least loosen restrictions on data access.

#5. *What challenges currently exist in linking state and local data to federal data?*
-   In social programs it is often local grantees that collect program performance data that are then aggregated at the state level for federal reporting. Issues of capacity to collect reliable data are compounded when sub-grantees are involved.
-   Local communities often need small area estimates for which there may be significant quality issues.

#7a. *What data should be included in a potential US government data clearinghouse(s)?*
[The Commission is aware that, under Open Data, agencies have inventoried over 70,000 datasets, with a potential additional 70,000 non-public datasets. This would be prohibitively difficult to work with so the Commission is considering creating a list of the top 20 to work with.]
-   Some of the most useful data for assessing program outcomes (health, education, employment and income status) are actually state data, not federal data. Accessing them requires separate negotiation with the individual states as well as addressing data compatibility across states.
-   Policymakers' needs should be more prominent in this discussion. GPRA's lesson was that supply was not as important as demand for use of evidence in decision making. What is the Hill's agenda and timing? What is the agency's evaluation agenda?
-   Agencies struggle with prioritizing evaluation questions, so the Commission could help by developing a framework for prioritizing evaluation questions.

#7b. *What are the current legal and administrative barriers to including such data in a clearinghouse or linking the data?*
-   Several databases contain highly sensitive national security data that do not seem appropriate for this use, or would require different security protocols.
-   Some programs (e.g., child welfare) explicitly prohibit releasing data with the personally identifiable information that is specifically required to link with other datasets.
-   Private sector companies lack a common identifier that can be used to link data on their contacts with various federal bureaus.
-   Data definitions, etc. vary tremendously across cash and food assistance programs. Data quality also varies across datasets, so what mechanism could we use to grade data quality, and to enforce data standardization?
-   The Department of Education requires the evaluator to demonstrate a valid educational purpose to combine their data with data from another federal program. This constrains the ability to examine cross-cutting issues.
-   The length of the Paperwork Reduction Act review process at OMB (for example, 2 years) is a considerable barrier to conducting evaluations in a timely manner.
-   Weak design and implementation of data quality controls; e.g., GAO recent assessment of the reliability of OPM payroll data. http://www.gao.gov/products/GAO-17-127

Submitted 10/14/2016

#8. *What factors or strategies should the Commission consider for how a clearinghouse could be self-funded?*
- Medicaid charges a federal agency $25,000 for access their claims data; non-government users pay more. Researchers consider this a barrier to use.

#10. *How should the Commission define "qualified researchers and institutions"?*
- The Centers for Medicare and Medicaid Services provide researchers with training and technical assistance and access to Medicare and Medicaid data through the Research Data Assistance Center (ResDAC) located at the University of Minnesota. http://www.resdac.org/ It has a "qualified entity program" defined by the Patient Protection and Affordable Care Act.
- Would government and non-government researchers and entities be treated alike?

#12. *If a clearinghouse were created, what types of restrictions ought to be placed on the uses of the data by "qualified researchers and institutions"?*
- Note that databases are typically created for specific uses and may not be appropriate for other uses. People outside the program can easily misinterpret data leading to misuse of data.
- See the procedures used by ICPSR (and other organizations described above) for managing access to restricted use datasets. https://www.icpsr.umich.edu/icpsrweb/content/ICPSR/access/restricted/index.html

#16. *How can data, statistics, results of research, and findings from evaluation be best used to improve policies and programs?*
- We appreciate the Commission's broad definition of "evidence", but it would also be useful to define "rigor" and "quality" of evidence, which involves data source, reliability, the rigor of the evaluation, internal and external validity, use of mixed methods. Note that program administrative data only pertain to program participants, and exclude nonparticipants which might form a proper comparison group with which to assess program effects.
- Beware that, in combining administrative data with other data, the quality of the data may be compromised.
- Please recognize that for data to become evidence there first needs to be a research question that determines how the data will be analyzed.
- There is very little guidance out there about how to use data or evidence to inform policy – how to analyze and use it.
- The intermediary step between having data and creating policy is the learning process. We use a variety of studies, both summative - to answer whether an approach works - and formative - to understand how an approach is implemented in practice.
- Local communities and federal agencies may have different questions and uses for data.

#17. *To what extent can or should program and policy evaluation be addressed in program design?*
- The best-known example is the tiered-evidence grants which provide more funding to expand approaches that have stronger evaluation evidence of effectiveness and less to programs with less or weaker evaluative evidence. There is concern that requiring prior evaluation evidence for funding could stifle program innovation.
- There is also a concern that these tiered-evidence programs tend to rely too narrowly on impact evaluations using experimental research designs. Such evidence of internal

3

validity is important but not sufficient for replication, scale-up (external validity assessment), and learning <u>how</u> the program works, and is often not appropriate for some types of prevention programs.

General Comment

Dear Commission on Evidence-Based Policymaking,

I love the American concept of voter-based, Constitution-based, elected representative-based, policymaking. It's why I live in America. In contrast to voter-based policymaking there is evidence-based policymaking, which I don't love because it implies that one entity's "evidence" trumps individuals' consent to new policy changes.

Former Secretary of Agriculture Ezra Taft Benson said something about education that also applies to educational data and policymaking:

"The best way to prevent a political faction or any small group of people from capturing control of the nation's educational system is to keep it decentralized into small local units... This may not be as efficient as one giant super educational system (although bigness is not necessarily efficient, either) but it is far more safe. There are other factors, too, in favor of local and independent school systems. First, they are more responsive to the needs and wishes of the parents and the community. The door to the school

superintendent's office is usually open to any parent [or teacher]... But the average citizen would be hard pressed to obtain more than a form letter reply from the national Commissioner of Education in Washington, D.C."

Local control, and consent of the governed, are two foundational principles in our great nation.

Because the CEP is not an elected body, it does not hold authority to collect, or to recommend collection, of student-level evidence, or of any evidence, without written consent; and, for the same reasons, neither does the Department of Education.

Because the fifty, federally-designed, evidence-collecting, State Longitudinal Database Systems never received any consent from the governed in any state to collect data on individuals (as the systems were put into place not by authority, but by grant money) it follows that the idea of having CEP study the possible removal of barriers to federal access of those databases, is an egregious overstep that even exceeds the overstep of the State Longitudinal Database Systems.

Because federal FERPA regulations altered the original protective intent of FERPA, and removed the mandate that governments must get parental (or adult student) consent for any use of student level data, it seems that the idea of having CEP study and possible influence removal of additional "barriers" to federal use of data, is another egregious overstep.

As a licensed teacher in the State of Utah; as co-founder of Utahns Against Common Core (UACC); as a mother of children who currently attend public, private and home schools; as acting president of the Utah Chapter of United States Parents Involved in Education (USPIE); as a patriot who believes in "consent of the governed" and in the principles of the U.S. Constitution; and, as a current tenth grade English teacher, I feel that my letter represents the will of many who stand opposed to the study of the removal of protective barriers on student-level data, which the CEP's website has outlined it will do.

I urge this commission to use its power to strengthen local control of data, meaning parental and teacher stewardship over student data, instead of aiming to broaden the numbers of people with access to personally identifiable student information to include government agencies and/or educational sales/research corporations such as Pearson, Microsoft, or the American Institutes for Research.

To remove barriers to federal access of student-level data only makes sense to a socialist who agrees with the Marc Tucker/Hillary Clinton 1998 vision of a cradle-to-grave nanny state with "large scale data management systems" that dismiss privacy as a relic in subservience to modern government. It does not make sense to those who cherish local control.

It is clear that there is a strong debate about local control and about consent of the governed, concerning data and concerning education in general. NCEE Chair Mark Tucker articulated one side of the debate when he said: "the United States will have to largely abandon the beloved emblem of American education: local control. If the goal is to greatly increase the capacity and authority of the state education agencies, much of the new authority will have to come at the expense of local control."

Does that statement match the philosophical stand of this commission? I hope not. Local control means individual control of one's own life. How would an individual control his or her own destiny if "large scale data management systems" in a cradle-to-grave system, like the one that Tucker and Clinton envisioned, override the right to personal privacy and local control? It is not possible.

I urge this commission to use any influence that it has to promote safekeeping of unit-record data at the parental and teacher level, where that authority rightly belongs.

Sincerely,

Christel Swasey

I see that you've 'redacted' the previous six comments! At least you're reading them, but they're hidden which is censorship.

The constitution is still in effect at the moment, just a reminder.

Well, the short of what I have to say is, NO. I refuse the government agencies, state agencies, any agencies to gather data and / or ask my child questions relating to anything.

You do not have the authority to do so. The American public does not want you to.

What you're doing is illegal.

Here comes Donald Trump to the rescue, Thank GOD.

As an avid anti federal legislation in education researcher and writer, I find that this is not only, once again, a violation of our U.S. Constitution, but, frankly, a violation of ethics, morals, a our privacy. This Panel is too closely tied to the newly created public-private Artificial Intelligence Council of which you will find some of the same backers involved in this as well.

ESSA (Every Student Achieves Act) also rubber stamps MORE federally dictated/led education policy. Have we learned NOTHING in the past? It is not right, legal, or binding that the U.S. is making such global strides to not only data track and mine our citizens via education or our workforce! This moves are being made to rather satisfy an agreement made with the United Nations. We the people did not get to voice that we wish to remain American, not global citizens. Why do I bring this up? Education for all is among the Goals in the US/UN agreement. Again, no voice, no vote by the citizens.

ORCID comments to EBPC - 20161021

To: The Commission on Evidence-based Policy Making
Re: Docket Number 160907825–6825–01
From: Laurel Haak, Executive Director, ORCID, l.haak@orcid.org
Date: 21 October 2016

Abstract: We all would like to better understand how innovation works, the better to support it. That requires both better access to information about R&D and a shift in our thinking about the role of researchers -- those at the heart of the innovation process. We need linked data infrastructures on the education, affiliations, funding, activities and outputs of researchers. ORCID identifiers provide the basis for such linking at a federal and international level. This can revolutionize our understanding of innovation and lead to more effective R&D policies and better government investments.

Statement: There is broad international consensus that innovation and R&D matter for long-term economic growth and that innovation underpins many improvements in social, health and environmental outcomes. Governments play a key role in innovation by influencing framework conditions, setting policies, and providing funding assistance. The exact mechanisms, however, through which research, science and innovation lead to socioeconomic outcomes are not well understood. We need to better understand these interconnections and develop a robust theory of change, which can underpin government policies and investments.

Delivering on this aspiration requires governments to build local, national, and international data infrastructures for science and innovation. International standards, in particular, are essential given the global nature of science and the fact that the research community is highly mobile. Linked data on the funding of R&D and the outputs generated is a first step to building this infrastructure.

Data oversight and quality of federal support for R&D is poor. A recent paper by the National Science Foundation[1] highlights the poor state of federal data. This needs to be urgently rectified by developing standards for funding of R&D and federal agencies agreeing to implement these standards. Obtaining an accurate picture of federal investment in R&D is critical to developing understanding of how the innovation system works and generating evidence on return on investment. It is beholden on the federal government to present linked data on the investments it is making in the science and innovation system to the public.

Second, the outputs of the research and innovation system need to be systematically collected and linked back to funding sources. It is only when the key inputs and outputs are clearly linked that we can begin to understand how government policies and investments impact innovation. Aggregated data from across funding mechanisms and the various federal funding agencies will

---

enable policymakers to determine the relative effectiveness and impacts of various investments and policy settings.

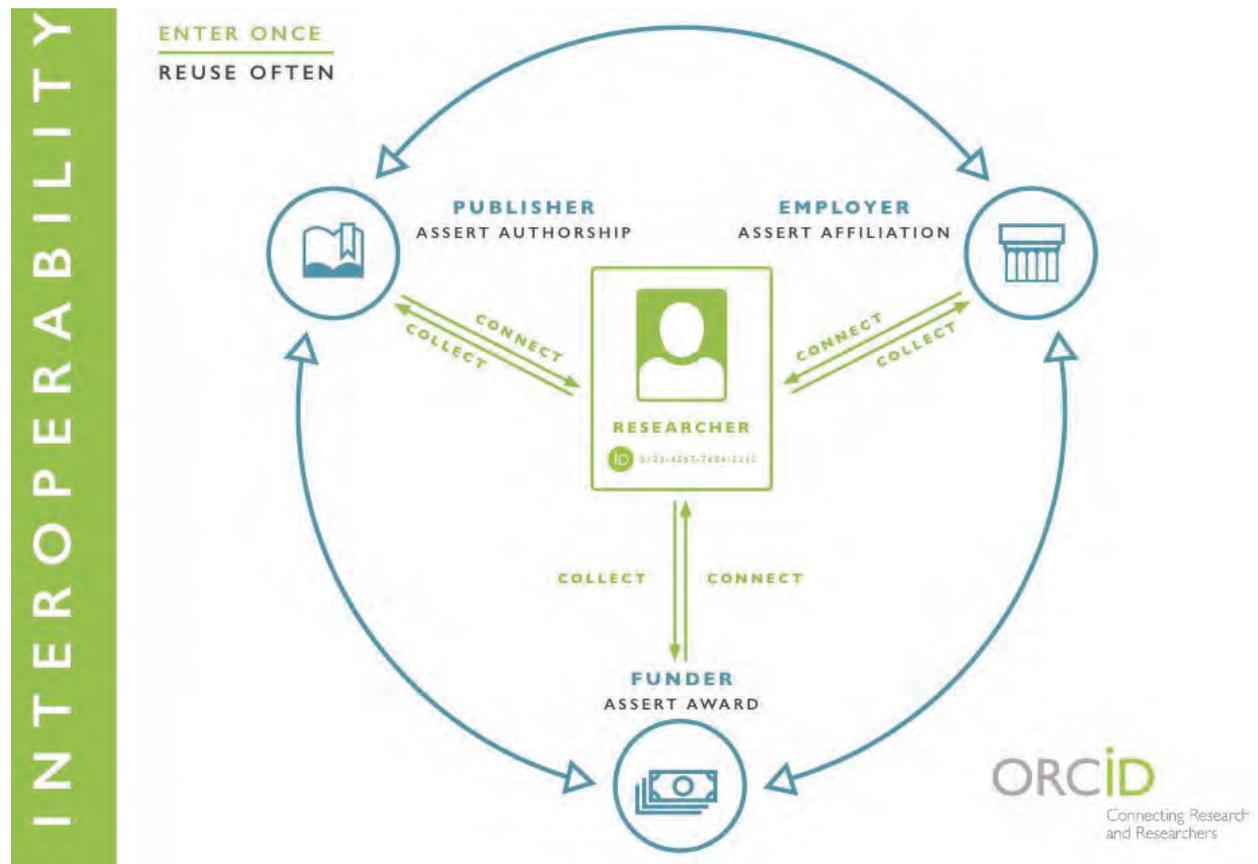
At the heart of the innovation process rests people. It is researchers who generate both incremental and transformative innovations. The researcher needs to therefore be at the heart of data infrastructures for research and innovation. ORCID identifiers provide that foundation. In 2012, ORCID launched a registry where researchers can obtain a unique identifier that they can use as they complete their theses, publish, apply for grants or submit reports as a student or employee at a research organization. These research "transactions" involve obtaining the consent of the researcher to both collect their identifier and share information about the activity or affiliation (Figure 1).


Figure 1. The ORCID vision starts with researchers, and involves the entire research community in collecting persistent identifiers, connecting them to activities and affiliations as researchers engage in these activities, and making public and verified assertions about relationships.

The ORCID registry has already issued more than 2.6 million identifiers around the world and uptake is rising fast. The ORCID system is now integrated with all of the world's major publishers, hundreds of universities and research organizations and more and more funding agencies. Some funding agencies, including the Portuguese Fundacao Ciencias e Technologia, the Swedish Research Council, Science Foundation Ireland, the UK National Institute for Health

Research and the US Department of Transportation have already mandated the use of ORCID identifiers.

ORCID is being adopted at a national level in countries across Europe and Oceania, and by funding organizations and publishers around the world. It is being used by funders and government agencies in the United States including NIH, DOE, EPA, and has been recognized by Science Europe - an association of European research funding organizations - as a key component of the research infrastructure.[2] In Australia, Europe, and the UK, ORCID is a component of their grant management programs.[3] In New Zealand ORCID will be a critical underpinning feature of the national data strategy for science and innovation which contains a vision of creating a national research information system which links data on funding, researchers, outputs and end user collaborations.[4]

Widespread use of ORCID identifiers around the world is paving the way for a global R&D data infrastructure. Unfortunately, federal agencies have been slow to see the potential of ORCID identifiers. ORCID is registered in the United States, yet few federal funding agencies have integrated ORCID identifiers into their systems. This needs to change if the United States government wishes to generate evidence on the impacts of its R&D investments.

Data specifically about researchers, for example detailed survey files managed by the National Science Foundation, or actual grant application and award data held by the National Institutes of Health[5], or administrative data held by universities relating to federally-funded projects[6], makes it possible to gain a much deeper and more nuanced understanding of innovation – and the impact of policies.

However, at present, it is very difficult to gain access to these individual-level data, as the researchers involved have not given permission for it to be disclosed beyond the agency or employer. This has necessitated the implementation of secure data centers, stringent access policies, and has restricted the types of analysis that can be performed.

However, it is possible to envision an open data infrastructure that would enable sharing of much of this data that is locked within agencies. Such an infrastructure is indeed becoming a

reality at an international scale,[7] supported by an evolving community consensus on FAIR data management principles.[8] It is based on persistent identifiers, community participation, and the consent of individuals in sharing their information.[9] ORCID has emerged as the global standard for identifiers for researchers. Persistent identifiers (digital object identifiers) for research articles and datasets have been in place for over a decade. It is now a standard practice for DOIs to be assigned to articles and datasets as they are published, and these identifiers underpin search and discovery of tens of millions of items in the research literature. DOI assignment is managed by two non-profit organizations, CrossRef (crossref.org) and DataCite (datacite.org).

With my colleagues at Crossref and DataCite, I ask that the Committee consider the role that persistent identifiers can play in improving data on the inputs and outputs of the research and innovation ecosystem. I strongly encourage you to consider the essential role of researchers: they must be included as partners in any initiative to share research information. I also encourage the Committee to open up the funding of R&D by federal agencies and develop data standards to enable data aggregation. Naturally, we believe that all federal agencies should integrate their systems with ORCID.

As Robert Oppenheimer said, "The best way to send information is to wrap it up in a person." As we use person-level data to understand innovation, we can demonstrate the verity of this statement.[10] The more ways that individual researchers can connect their unique identifier to activities and affiliations, the more we will understand the flow of knowledge underpinning innovation and develop appropriate policies to support it.

General Comment

Dear Commission on Evidence-Based Policymaking,

I love the American concept of voter-based, Constitution-based, elected representative-based, policymaking. It's why I live in America.

In contrast to voter-based policymaking there is evidence-based policymaking, which I don't love because it implies that one entity's "evidence" trumps individuals' evidence, or trumps individuals' consent to policy changes.

Former Secretary of Agriculture Ezra Taft Benson said something about education that also applies to educational data and policymaking:

"The best way to prevent a political faction or any small group of people from capturing control of the nation's educational system is to keep it decentralized into small local units, each with its own board of education and superintendent. This may not be as efficient as one giant super educational system (although bigness is not necessarily efficient, either) but it is far more safe. There are other factors, too, in favor of local and independent school systems. First, they are more responsive to the needs and wishes of the parents and the community. The door to the school superintendent's office is usually

open to any parent who wishes to make his views known. But the average citizen would be hard pressed to obtain more than a form letter reply from the national Commissioner of Education in Washington, D.C."

Local control, and consent of the governed, are two foundational principles in our great nation.

Because the CEP is not an elected body, it does not actually hold representative authority to collect, or to recommend collection, of student-level evidence, or of any evidence, without written consent; and, for the same reasons, neither does the Department of Education.

Because the fifty, federally-designed, evidence-collecting, State Longitudinal Database Systems never received any consent from the governed in any state to collect data on individuals (as the systems were put into place not by authority, but by grant money) it follows that the idea of having CEP study the possible removal of barriers to federal access of those databases, is an egregious overstep that even exceeds the overstep of the State Longitudinal Database Systems.

Because federal FERPA regulations altered the original protective intent of FERPA, and removed the mandate that governments must get parental (or adult student) consent for any use of student level data, it seems that the idea of having CEP study and possible influence removal of additional "barriers" to federal use of data, is another egregious overstep.

As a licensed teacher in the State of Utah; as co-founder of Utahns Against Common Core (UACC); as a mother of children who currently attend public, private and home schools; as acting president of the Utah Chapter of United States Parents Involved in Education (USPIE); as a patriot who believes in "consent of the governed" and in the principles of the U.S. Constitution; and, as a current tenth grade English teacher, I feel that my letter represents the will of many who stand opposed to the "study" of the protective barriers on student-level data, which the CEP's website has outlined it will do.

I urge this commission to use its power to strengthen local control of data, meaning parental and teacher stewardship over student data, instead of aiming to broaden the numbers of people with access to personally identifiable student information to include government agencies and/or educational sales/research corporations such as Pearson, Microsoft, or the American Institutes for Research.

To remove barriers to federal access of student-level data only makes sense to a socialist who agrees with the Marc Tucker/Hillary Clinton vision of a cradle-to-grave nanny state with "large scale data management systems" that dismiss privacy as a relic in subservience to modern government. It does not make sense to those who cherish local control.

It is clear that there is a strong debate about local control and about consent of the governed, concerning data and concerning education in general. NCEE Chair Mark Tucker articulated one side of the debate when he said: "the United States will have to largely abandon the beloved emblem of American education: local control. If the goal is to greatly increase the capacity and authority of the state education agencies, much of the new authority will have to come at the expense of local control."

Does that statement match the philosophical stand of this commission? I hope not. Local control means individual control of one's own life. How would an individual control his or her own destiny if "large scale data management systems" in a cradle-to-grave system, like the one that Tucker and Clinton envisioned, override the right to personal privacy and local control? It is not possible.

Authority regarding the management of data belongs at the local level - not the federal level.

Overarching Questions

> 1. Are there successful frameworks, policies, practices, and methods to overcome challenges related to evidence-building from state, local, and/or international governments the Commission should consider when developing findings and recommendations regarding Federal evidence-based policymaking? If so, please describe.

There are several ongoing privately sponsored community-based programs that link data across local, state, and national levels. An ongoing project at the University of Chicago (Goerge, 2013) provides an example of evidence-building that could be advanced more effectively and scaled to greater impact by facilitating data sharing. For the past 30 years, researchers have been laboriously compiling a database with anonymized information on Chicago's children from information housed at multiple state and local agencies, including schools, social services, and criminal justice. Combined with contextual information (e.g., census tracts, city administrative districts), geographical areas where resources could be targeted to improve family well-being and reduce dependence on public services can be identified. Parallel work at the University of Chicago's Urban Center for Computation and Data shows how such data could be acquired, anonymized, and georeferenced more efficiently by synthesizing digital data streams from diverse administrative databases. The Chicago work shows the potential utility of such efforts for providing services to citizens.

A second effort is entitled the National Neighborhood Indicators Partnership (Kingsley & Pettit, 2011). In this collaborative effort between the Urban Institute and 37 cities, all partners build and operate neighborhood level information systems, drawing upon administrative data from multiple sources. Data on employment, Births, deaths, Crimes, TANF, Food Stamps, Child care, Health, and schools are merged with property, tax, and infrastructure quality information. Activities consist of continuous indicator review and dissemination of information over the web. Indicators at the city or metro-wide level can be used to change laws and policies; for geographic targeting/coordination of resources for programs and investments; for individual neighborhood improvement initiatives; for performance management; and for program evaluation.   The types of data include national data files –e.g., American Community Survey; open data – government administrative data; and integrated data systems. One important substantive area studied was the effect of foreclosures on children. One program linked foreclosures in

neighborhoods to the number of children in those areas. They did this by linking parcel level data on properties and neighborhood level data.

2. Based on identified best practices and existing examples, what factors should be considered in reasonably ensuring the security and privacy of administrative and survey data?

The two critical factors are potential risk of disclosure and degree of harm that could follow. First, how likely is it that someone could be identified given the data available? Second, how serious is the harm that would be occasioned?

In a book *Privacy, Big Data, and the Public Good: Frameworks for Engagement*, Julia Lane and colleagues (2014), describe the importance of balancing data utility for the public good against disclosure risk. One of the most important potential risks is that of disclosing the geographic location of individuals whose data are held, and, therefore, potentially disclosing their actual identity. This risk collides head on with our understanding of the critical part that residence plays in access to quality public and private services, governance, and community amenities, and risk of weather-related and other events.

A second area of potential risk could occur when data sets are linked or combined, depending on the types and level of information contained in the different data sets. However, the main advantage of linking is that of efficiency; once the possibility of linking is available, data collectors need to add only the data elements not otherwise available.

Data Infrastructure and Access

3. Based on identified best practices and existing examples, how should existing government data infrastructure be modified to best facilitate use of and access to administrative and survey data?

Major types of structures for data sharing include release of public use data, access to a research data center in which the researcher can access but not remove data, provision of a license or contract to obtain restricted files, release of synthetic files in which some data are altered, access to a government employee who actually runs analysis software on the data, and a data enclave in which data are accessed remotely. At the present time the National Center for Health Statistics (NCHS) uses several models: data are divided by level of risk. Low risk data are released on-line as public data files. Descriptors of geographic location are not released in these public data files. To obtain geographic information on state of birth, for example, an application needs to be submitted to NCHS. The NCHS will release the geographic data after the application is approved. Because only data at the state level are released, and the state numbers are large, the risk of individual identification is low.

Data with greater risk of individual identification or disclosure, such as geographic location at the county or census tract level, have a higher bar for sharing. For them, the NCHS uses the Census Bureau Research Data Center (RDC) model, a physical location in which researchers can securely access confidential data. For example, researchers can access securely the geographic location of participants and merge onto their data files information about that geographic location. The actual geographic location can be removed from files once this other information is attached. The data on the file retain

confidentiality. Other types of data can be linked as long as there are restrictions on how data sets can be linked and what types of information can be made available to researchers.

Given new technology, a large dedicated physical structure becomes less necessary. Instead, the data enclave model seems to be the most feasible and practical. The enclave does not need to actually have possession of the data, simply a secure connection to the organization that does.

> 4. What data-sharing infrastructure should be used to facilitate data merging, linking, and access for research, evaluation, and analysis purposes?

The federal government has legal restrictions on data sharing. An efficient way to improve access would be for the federal government to contract with a private data center to oversee and monitor the process of reviewing requests for data access, setting up specialized data, and reviewing and monitoring data users. A number of such data centers are currently in place.   The Research Data Centers (RDC) of the U.S. Census Bureau are examples; however, in this case employees need to be Census Bureau employees, a very restrictive management model and quite expensive. In addition, data are actually accessed in the RDC.

As an alternative model, access could be provided through a private data center, but the data sets could be housed with their original proprietors. In this model, a center would help identify data needed by a prospective researcher. The center would be charged with having a record of the type of confidentiality protection required by the data provider and would broker access to the data. Access could be obtained remotely through the data center. The researcher may wish to have access to data with differential restrictions on access; the data center could handle this process so that the individual could access, merge the data and analyze the data for scientific purposes with approved access protocols administered by this single organization.

> 5. What challenges currently exist in linking state and local data to federal data? Are there successful instances where these challenges have been addressed?

Because such initiatives are so important, why have they not happened more broadly?   This is partly because agencies, levels of government, professionals, and advocates work in silos that prevent putting together comprehensive data in a format conducive to research and analysis. Integration and collaboration are critical for putting the information together.   With increased concern about confidentiality and identity theft, some of the biggest obstacles are in putting together complex data sharing agreements. More resources could be spent to develop model examples of such agreements that could be widely used. A network of regional data centers that utilizes and shares these models would be an enormous contribution. At the moment there is substantial expertise in different areas of the country, but no concerted effort to learn and share experiences, in spite of the increasing interest in addressing the obstacles to data sharing and encouragement by many federal agencies in increasing the usage of administrative and other data.

6. Should a single or multiple clearinghouse(s) for administrative and survey data be established to improve evidence-based policymaking? What benefits or limitations are likely to be encountered in either approach?

In a series of meetings conducted by the Social Observatories Coordinating Network over the past three years (see materials at socialobservatories.org), the network settled on a challenge for the future— to design a national network of regional data centers that could be coordinated through common objectives, sharing of protocols, and data sharing (Moran et al. 2014). The network concluded that behavior is so situation- and place-specific that it is practically impossible to use widely dispersed national samples of populations to draw conclusions about processes in any one place. Based upon extensive discussion and consultation with statisticians, our model would embed in a set of 20-25 regional observatories or data centers a nationally representative population-based sample from about 400 census tracts that would enable the observatory data to be aggregated in such a way as to produce a nationally representative picture of the United States on an ongoing basis while also fully capturing the diversity that characterizes local places. Each would be an entity, whether physical or virtual, that is charged with collecting, curating, and disseminating data from people, places, and institutions in the United States. Each of these data centers would be responsible for gathering information from a set of tracts that are located in proximity to their collaborating scientists and other information from their local community. The individuals, institutions and communities in which these census tracts are embedded can be systematically studied over time and space by regional data centers and the data would represent the U.S. as a whole.

7. What data should be included in a potential U.S. government data clearinghouse(s)? What are the current legal or administrative barriers to including such data in a clearinghouse or linking the data?

Each data center would be charged with cataloging and providing access to data collected and archived from the local area as well as data that may be national in scope. They are also intended to stimulate the development of new directions and modes of inquiry. They will do so through the use of diverse complementary methods and data sources including ethnography, experiments, administrative data, social media, biomarkers, and financial, land, environment, and public health records as well as survey research. These observatories will work closely with local and state governments to gain access to administrative records that provide extensive data on the population in those tracts, thereby providing a depth of understanding and integration of knowledge that is less invasive and less subject to declining response rates than survey-derived data. Starting with a single such data center charged with setting up confidential data agreements and facilitating access would be a pathway to such a network. This initial national data center, as test of the framework, can serve as a pilot for the larger network of centers needed to meet national needs.

Data are collected by private parties such as Twitter, eBay, Netflix, LinkedIn, Facebook, and others. Many of these companies make their data available to researchers under contract.   When combined with other private data or other public surveys and administrative data sets, these data could be very useful but their use poses some very challenging privacy and security issues.

Traditional forensic lab data along with emergency calls, and Google Trend or Twitter data can be used for emerging disease or drug trends.

> 8. What factors or strategies should the Commission consider for how a clearinghouse(s) could be self-funded? What successful examples exist for self-financing related to similar purposes?

One such effort is located in the Urban Center for Computation and Data at the University of Chicago; 18 different organizations and multiple individuals are involved (Goerge, 2013). Data come from 311 service requests, 911 calls, and other public and private data bases. This group is taking the data and making them accessible to the community. Existing software programs extract data coming out of the continuously updated grid to create analysis files. With additional resources the data bases currently developed could be continuously updated and transferred to a data portal that multiple partners could access in real time. This would permit city officials to use their administrative data to better target resources. Social media data could be geographically linked so that police and social workers would be aware of potential problems at locations in the city even prior to or during adverse environmental and social events. With additional resources they would be able to follow children from different environmental locations into adolescence, linking data from public school and education records and then adulthood, linking employment and wage data from national data bases. Such centers could also develop and archive data from evidence-based program evaluations that are increasingly required by federal agencies.

A data clearinghouse is not initially self-fundable but requires a consortium of private and public sources of support on behalf of the national statistical system and scientific enterprise similar to the city-focused model represented by Chicago. This would most likely require substantial federal seed money through grants to get it off the ground, but the model could eventually be integrated into regional statistical systems, local governmental budgets, and private funding partnerships.

The National Neighborhood Indicators Project (NNIP) started in 1995 with 6 institutions that had put together data sharing arrangements in their cities. Today this neighborhood indicators partnership has expanded to 37 cities and 12 more are talking about joining. These include community and social service nonprofits, university, metropolitan planning agencies, and foundations; all have a substantial community involvement component, i.e. they are close to the stakeholders. Data are used for performance measurement, management and policy analysis.

> 9. What specific administrative or legal barriers currently exist for accessing survey and administrative data?

These barriers will vary across administrative areas such as states, counties, and cities, thus fitting with the proposed regional focus of such data centers. Each center will be attuned to local issues and administrative concerns. In addition to the confidentiality issue, an underlying barrier, and justification for regional focus, is that formats are often incompatible. Whereas a regional center can link at the local level, such centers will have the resources to figure out how to link across centers to provide a national picture.

5

10. How should the Commission define "qualified researchers and institutions?" To what extent should administrative and survey data held by government agencies be made available to "qualified researchers and institutions?"

Most public access data shops request researchers to fill out a form that describes the research project for which they are requesting access to data.   In 25 words or so, it is fairly straightforward to describe and then determine whether this is a legitimate project. Plus contact information from the potential user is required. We have had requests from clearly illegitimate "bots".   Those are easy to sort out.

Adding the requirement to fill in a randomly generated passcode is also helpful.

11. How might integration of administrative and survey data in a clearinghouse affect the risk of unintentional or unauthorized access or release of personally-identifiable information, confidential business information, or other identifiable records? How can identifiable information be best protected to ensure the privacy and confidentiality of individual or business data in a clearinghouse?

Because we are recommending that this data center not actually hold the data, but rather serve as a portal to access data, we imagine that the organization/entity will be charged with implementing a variety of different types of data confidentiality provisions and licenses. Having a single entity charged with implementing a set of confidentiality protections for access to data through a single portal is efficient. There is sufficient expertise in the social science community to put those protections in place. There has never been a data breach in the existing data centers to date.

12. If a clearinghouse were created, what types of restrictions should be placed on the uses of data in the clearinghouse by "qualified researchers and institutions?"

This would depend upon the organization providing access to the actual data.

13. What technological solutions from government or the private sector are relevant for facilitating data sharing and management?

A set of private data centers could involve private industry such as Google, Facebook, Twitter, etc. who have already been addressing these issues. Participation from these sophisticated technology companies is essential but they need the participation of qualified researchers and institutions in universities to better identify the important questions about our society and contextual variables to include.

14. What incentives may best facilitate interagency sharing of information to improve programmatic effectiveness and enhance data accuracy and comprehensiveness?

The best incentive would be the actual productive use of data they generate. Too much of the data collected by local, state and federal agencies remains archived and unused. Making these data available would constitute a more efficient use of resources and may obviate the need for other forms of data collection which may be more invasive. However, additionally, having a private non-government entity

6

funded and charged with the proper protection of the data and facilitating access to approved individuals, would also be an incentive.

Data Use in Program Design, Management, Research, Evaluation, and Analysis

15. What barriers currently exist for using survey and administrative data to support program management and/or evaluation activities?

Barriers to entry in terms of knowing how to access data and then gaining such access are substantial in both time and money. Census Bureau access through a Research Data Center requires a full proposal and then about $15,000 in research funds unless the investigator has access to an RDC at his/her institution.

16. How can data, statistics, results of research, and findings from evaluation, be best used to improve policies and programs?

A national framework for studying local contexts may be the best way forward. The best neighborhood studies to date feature specific cities such as Chicago or Los Angeles. The observatories will facilitate comparison across such communities. With a regional data center network, we can contemplate the possibility of a national sample of neighborhood and other local contexts that can be studied at multiple levels and in multiple ways. For example, because of the national sample frame of census tracts embedded in them, these observatories become ideal locales to examine how proximal social contexts (a) directly affect individuals' and families' social, behavioral and economic functioning or (b) alter social and behavioral relationships, and (c) how individuals and families, in turn, change their environments. The community context will enable the study of social networks, which cannot be studied within the current survey research model in which clustering of observation is minimal. It also increases the chance of linking climate change and other natural phenomena with behavioral responses. Naturally occurring exogenous shocks to some tracts but not all tracts will provide the opportunity for scientists to conduct comparative studies of adaptation and change. Similarly, a set of experimental trials situated in diverse contexts will afford researchers the opportunity to conduct rigorous comparative studies of interventions.

17. To what extent can or should program and policy evaluation be addressed in program designs?

One limitation of program evaluations is that they may be tested in one region of the country and not in others. The proposed infrastructure permits comparisons across communities. Program evaluation data should be part of this new set of regional data centers. The advantage of having a network is that projects will be encouraged to replicate their evaluations on programs spread across the U.S. This would enable researchers to see whether program success varies across the U.S.   Evaluations of responsible fatherhood initiatives varied across program locations, for example.

18. How can or should program evaluation be incorporated into program designs? What specific examples demonstrate where evaluation has been successfully incorporated in program designs?

No comment.

19. To what extent should evaluations specifically with either experimental (sometimes referred to as "randomized control trials") or quasi-experimental designs be institutionalized in programs? What specific examples demonstrate where such institutionalization has been successful and what best practices exist for doing so?

No comment.

*The Social Observatories Coordinating Network

The Social Observatories Coordinating Network (SOCN) is funded by the National Science Foundation to work with scientific communities in the development and planning of a set of observatories for the Social, Behavioral, and Economic (SBE) Sciences that will be transformative. This network follows up on a set of 4 workshops prior to 2010 and 4 from 2010 to 2012 that engaged the scientific community in initial discussions about the proposed approach. (Reports from the 2010-2012 meetings are available at the website below.) Dissemination of what we produce will play an important role, particularly at national professional meetings and other scientific conferences. The final product will be a report to NSF outlining the views of the various scientific communities and the consensus emerging from these discussions.

Members of the NSF Social Observatories Coordinating Network include:

J. Lawrence Aber, New York University
Henry E. Brady, University of California, Berkeley
Dalton Conley, New York University
Susan Cutter, University of South Carolina
Catherine Eckel, Texas A & M University
Barbara Entwisle, University of North Carolina
Sandra Hofferth, University of Maryland
Klaus Hubacek, University of Maryland
Emilio Moran, Michigan State University

A complete list of earlier contributors to this project can be found at the website below.

For additional information contact:

Sandra Hofferth: hofferth@umd.edu or

Emilio Moran: moranef@msu.edu

Our objectives and reports from previous meetings are available at:

http://socialobservatories.org/

General Comment

Hi,
We are a non profit that shows the advantages of saving sex for a commitment. The women that we have shared our information with either waited to have sex until they were engaged to be married or are currently in a long term relationship but still saving sex for a major commitment like marriage/engagement. This was achieved by sharing with them a few surveys that we conducted that shows that...

1 Most men prefer virginity in the woman they marry.

2 Having sex with a man doesn't help him fall in love, make a woman more special to him or even guarantee a commitment will follow.

3 If a man is using a woman for sex, it is very unlikely that she will get a commitment.

4 When a man has serious intentions for a woman he will wait significantly longer for sex than if he intends to just use her for sex.

My wife develops scientific studies for Neilsen. And together we put together 3 small surveys that asks men questions that women want to know. For example, We just completed using Survey Monkey with 110 men, ages 18 to 29 in USA and found that...

3 out of 4 heterosexual men answered either Somewhat good or Very Good to the question "How would you feel if the woman you marry previously had never had sexual intercourse with another man" with the majority answering Very Good.

78% of heterosexual men said that it would bother them when asked "How would you feel if the woman you marry had sexual intercourse quickly with the men that she previously dated" with the majority saying that it would bother them a lot.

2 out of 3 heterosexual men answered Zero to the question "Would you prefer the woman you marry to have previously had zero sex partners or more than zero sex partners"

We had to pay for this out of our own pocket ($770). Zogby said they would replicate this study for $8,950. If we could just get funding, this information would have national visibility. On our small scale this worked. But we need help to take this to the next step.

I am not comfortable with everything about a student and their family being loaded on a data base right down to a students social media comments and social security number. This is new terrain and way to soon to run experiments with children's lives. We know all the data breaches that have taken place and can only imagine how putting personal information on a data base could turn out.

I am against the over-reaching collection of data on our children. When is enough enough? Never for these groups advocating for more and more data. Why? Are they really concerned about our children or more concerned about profiling them and making a lot of money off this sensitive data. The SLDS are too intrusive the way they are now. Why expand the information in them. I don't want my kids tracked from cradle to grave. Please start protecting them as this data is never safe from breaches and the more data you have on everyone, the more dangerous it is for our kids safety. Time to start protecting people's privacy.

I am wholly against creating a national database made up of the combination of many federal agencies for use in student data tracking. it is a violation of our privacy, and it can lead to massive misuse of data through unauthorized and unethical studies. It goes against the Institutional Review Board guidelines for human studies. Unscrupulous researchers can use data to create outcomes that suit their agenda. Algorithms are often wrong, and can be skewed to produce a specific goal and there is no oversight.

I respectfully ask that the ban on a national database on our citizens continue to be banned and not allowed under ANY circumstances.

Parent comment to CEP_ck

November 1, 2016

To the Comments to Commission on Evidence-Based Policy.
https://www.regulations.gov/document?D=USBC-2016-0003-0001

I am a parent, only a parent, but I hope the commission will consider my testimony with the same weight you give others who have a louder, perhaps more "important" voice.   Parents deserve to have a voice in matters involving children.

In the rush to collect and report student data, <u>WHO is auditing the data for accuracy</u>?

There are cases of KNOWN data erros being submitted.   The US Dept of Ed, Office of Civil Rights admits there is not sufficient protocol to verify data is correct and **according to State Dept of Ed, Office of Civil Rights**, **it is too burdensome to correct known data errors**.   **See news article and email exchange with US OCR**:   **http://tinyurl.com/zc9blg4**

How often do data errors like this happen? How would students know if incorrect data were being reported or inferred about them?   What decisions are being made based on inaccurate data?   The FTC has noted the lack of transparency / laws governing algorithms and   data brokers.

<u>NO transparency on algorithms.</u>

WHO is able to verify that analysis of data is not biased, when algorithms are kept secret, proprietary?   Unless students can see data being collected or inferred about them, the data should not be collected or shared. (FIPS, Nuremberg)

<u>Ethics and IRB's.</u>

Several presenters at the Oct. 21 Commission Education-based Policy hearing   mentioned that IRB reviews are hampering their data access.   **IRBs are essential in ensuring ethical use of data.**   Are those wanting access to data hoping to avoid *independent* analysis of their legitimate need and use of children's data?

<u>Security concerns abound.</u>

There are no enforceable penalties,   no parent right of action for misuse or breach of data, and the federal government has a shocking track record on data security. (OPM breach, http://www.reuters.com/article/us-cybersecurity-usa-idUSKCN0PJ2M420150709   and   the Vitara rating of F, over 400 repeat incidents in US Dept of Ed 2015 audit https://oversight.house.gov/hearing/u-s-department-of-education-information-security-review/ .)   Allowing the federal government even more access to student data, knowing these substantial deficiencies exist,   would be negligent.

The data collected and shared from ed records or SLDS is NOT just grades.

> Under the School Exemption Clause of FERPA, access to pii data contained in a student's education record or state longitudinal data base (SLDS) can be shared.   For a snapshot of pii data shared with researchers, see examples from the Colorado Dept. of Education research contracts here **http://tinyurl.com/he8z2yv**

> You will need to scroll through contracts to find data sharing section.   ie: see this contract with AIR,   (Appendix A) which allows access to pii educational records:
> **http://tinyurl.com/gnqt5ae**

SEL and 21st Century Skills.

> Teachers are required to upload ever increasing amounts of data, including behavioral and survey data, examples of how a student thinks, how a student feels (21st century social emotional skills.)   See one such survey here:
> https://drive.google.com/open?id=0B7epgdVXe0gKRm94TEt2aDVsQjA   This is subjective data at best, not to mention highly personal.   IS IT ETHICAL to allow behavioral and emotional data to be measured and shared outside of the classroom?   HOW will this information be used to profile or predict a child?   Considering that students' emotions will be measured and standardized / ranked in the near future,   access to personal student records needs to be better constrained, not broadened.
> http://blogs.edweek.org/edweek/rulesforengagement/2016/09/commission_formed_to_advance_schools_focus_on_social_emotional_development.html

A national Unit Record will Link   k12-to Higher ed data

Unless   you explictly prohibit in future statute, opening the higher ed student unit record   will lead to access to k12 ed record and K12 data, linking   data between agencies and programs.   The WDQI US Dept of Labor plans to access individual, pii, K12   student data, stored in state SLDS databases, starting in pre-school. SEE HERE:

http://tinyurl.com/ho9m9gq   https://www.doleta.gov/performance/workforcedataquality.cfm

Many panelists testifying in support of the unit record at the October 21, 2016 CEP hearing,   also propose accessing this K12 data.   For example, but not limited to, Rachel Zinn from the Workforce Data Quality Campaign, David Medina from the Results for America, Actionable Intelligence for Social Policy (AISP) America Forward Center for Employment Opportunities Center for Research and Reform in Education, Johns Hopkins University, KIPP, REDF, Sorenson Center for Impact Success for All Foundation Sunlight Foundation:

> **Medina testimony: "State Education and Workforce Data Systems**: The Commission **should recommend that Congress and the Administration support the enhancement of the existing State Longitudinal Data Systems (SLDS)** program administered by the U.S. Department of Education, which helps states integrate **education and workforce data, and the proposed expansion of the Workforce Data Quality Initiative*** that would help build state and local capacity to track employment and educational outcomes" CEP Hearing- Oct 21, 2016

Linking higher ed and K12 student data (K12 SLDS data systems) has long been the

goal: *Student data systems unite!-*2010
https://www.insidehighered.com/news/2010/02/16/data but has always been rejected due
to privacy or cost concerns.

  Bill Gates' recently released **2016 Priorities Report**, also stresses goal of linking K12 - Higher
Ed data, in a national database:

> Bill Gates: "Continue to develop robust state data systems that connect disparate higher
> education systems within and across states, including non-public institutions, and
> **improve linkages between higher education, K-12, and workforce data** to facilitate
> the timely and safe exchange of data for decision-making by educators and policymakers.
>
> **Develop a comprehensive national data system or exchange** that would expand
> coverage and quality by collecting a key set of performance metrics for all students in all
> institutions. Such a system or exchange would also alleviate reporting burden and reduce
> duplication by leveraging existing state and national data collections and would require
> revising data privacy and security protocols to ensure compliance with state and federal
> laws, as well as accepted standards and practices in the field. Options range from
> improving IPEDS to creating a **federal student-level data system**."
> http://postsecondary.gatesfoundation.org/wp-content/uploads/2016/09/PostsecondarySuc
> cessAdvocacyPriorities2016.pdf

There is a reason this national student database has been banned for years.

Some data should not be mixed. Data collection is **much more pervasive – and much less
controlled – than people realize.** Algorithms are often **biased and wrong**. There is no way for
a student to know how his/her data is being used against him/her or to know what opportunities
were denied based on this shared data.
http://www.fastcoexist.com/3057514/your-data-footprint-is-affecting-your-life-in-ways-you-cant
-even-imagine

> "I think the opportunity is a rich one. At the same time, the ethical considerations need to
> be guiding us," says Jesse Russell, chief program officer at the National Council on
> Crime and Delinquency, who has followed the use of predictive analytics in child
> protective services. Officials, he says, are treading carefully **before using data to make
> decisions about individuals, especially when the consequences of being wrong—such
> as taking a child out of his or her home unnecessarily—are huge**. **And while
> caseworker decision-making can be flawed or biased, so can the programs that
> humans design**. When you rely too much on data—if the data is flawed or incomplete, as
> could be the case in predictive policing—you risk further validating bad decisions or
> existing biases. **There's this danger we lose our identity as people and we become
> categories**."

Until there are LAWS and enforceable PENALTIES that restrict how data is collected, how it is shared, mixed, and transparency around algorithms and ways to audit and regulate the data analytics used to profile and predict a person, there should be no expansion of data collection.

Rather, people should own their own data and as in Europe, large agencies, nonprofits and corporations should not have access to children's personal data without consent.

Thank you for NOT creating a national student database that would increase risk for all stakeholders, especially the children you are meant to protect.

Thank you,

Cheri Kiesecker, parent

Comments Offered to the Commission on Evidence

COMMENTS OFFERED TO THE COMMISSION ON EVIDENCE- BASED POLICY
November 1, 2016

Paul E. Lingenfelter
President Emeritus, State Higher Education Executive Officers
paul@sheeo.org
11581 Eliot Court, Westminster, Colorado 80234
(303) 748-7425

The first section of these comments addresses the "Overarching Questions," and questions concerning "Data Use in Program Design, Management, Research, Evaluation, and Analysis" posed by the Commission. These comments are more fully elaborated in my book, *"Proof," Policy, and Practice: Understanding the Role of Evidence in Improving Education.* (2016. Stylus Publishing, Sterling, VA.) The second section will address specific questions concerning "Data Infrastructure and Access."

Although representing only my own views, my comments reflect my work experience and service in the following roles: Deputy Director, Illinois Board of Higher Education, Director of Program Evaluation and Vice President for Human and Community Development, John D. and Catherine T. MacArthur Foundation, President, State Higher Education Executive Officers association, and governing or advisory board member for the National Student Clearinghouse, National Survey of Student Engagement, National Institute for Learning Outcomes Assessment, and Parcc, Inc.

OVERARCHING QUESTIONS AND DATA USE IN PROGRAM DESIGN, MANAGEMENT, RESEARCH, EVALUATION, AND ANALYSIS

1. The proper use of evidence is essential for improving both policy and practice. But the complexity and variety of most situations confronted by policy makers and practitioners, pose serious challenges for the proper use of evidence. These challenges must be well-understood in order to avoid wasteful, unproductive effort and superficial "evidence," which can be ineffective, misleading, or even harmful.

    Chapter One, of *"Proof," Policy, and Practice* sets the stage for subsequent chapters of the book by discussing the difficulty of generating authoritative scientific knowledge in the situations faced by policy makers and practitioners. It draws largely on *Consilience* by E.O. Wilson, "Science and Complexity" by Warren Weaver, *Useful Knowledge* by Charles Lindblom and David Cohen, and *Unsimple Truths: Science, Complexity, and Policy*, by Sandra Mitchell.

2. Experimental methods, such as randomized clinical trials (RCT), are excellent tools for addressing problems with a relatively simple cause, which can be ameliorated with a straightforward, relatively simple intervention.

Unfortunately, few problems in social policy (especially perhaps, in education) are "conceptually neat," a term coined by Donald Berwick, a leader in the application of improvement science to the delivery of health care. Nearly half a century of efforts to use experimental methods in program evaluation have demonstrated most forcefully the inadequacy, rather than the utility of experimental methods to provide clear guidance for evaluating and improving complex programs to address complex problems.

Chapter Two summarizes major contributions to and debates within the field of program evaluation and offers a critical analysis of the Institute for Education Science's "What Works Clearinghouse," and work by MDRC.[i] It considers the particular case of Success for All, a multifaceted and thoroughly designed educational program, which has been positively evaluated, but has proved difficult to replicate widely. It provides examples of "conceptually neat" problems under which RCTs can make important contributions, such as: a study of the effects of providing guidance in completing Pell Grant applications in the course of tax preparation assistance, and studies of the effectiveness of making good choices the "default" option for policies such as retirement savings. But the number of "conceptually neat" problems are few.

Chapter Two also draws on *Realistic Evaluation* by Ray Pawson and Nick Tilley who advocate evaluating the effectiveness of individual interventions in particular situations, rather than mounting experiments to discover large scale interventions that "work" across varying situations. As discussed in Chapter Five, improvement scientists in industry and health care employ this technique.

3. Proper attention to the problem of measurement is essential for using evidence to improve policy and practice. E.O. Wilson asserts that measurement using "universally accepted scales" is a fundamental requirement for science. And the essential role of measurement is universally recognized by the discipline of "improvement science" in industry, health care, and most recently in the Networked Improvement Communities of the Carnegie Foundation for the Improvement of Teaching. But getting measurement "right" is challenging.

Chapter Three offers a discussion of the potential and the challenges of measurement focusing on four initiatives in education: a) *Measuring Up,* a ten year initiative of the National Center for Public Policy in Higher Education, which graded the states on their performance in key dimensions of higher education policy and outcomes; b) the Data Quality Campaign, which has successfully promoted the development of more robust, longitudinal data systems in the states and helped inspire the Common Education Data Standards initiative; c) the Common Core Standards for Career and College Readiness in mathematics and English language; and d) Assessing Higher Education Learning Outcomes (AHELO), a recent initiative

of the Organization for Economic Cooperation and Development.

These four initiatives have provided opportunities to learn about the challenges of creating valid, useful measurement, and the difficulties of translating useful measurement into action for improvement. None of them solved all the relevant problems, but all of them have made important contributions in increasing our understanding of measurement challenges and our capabilities for using measurement productively.

4. Useful evidence must be fit for the purposes for which it is employed, it must serve the purposes of the stakeholders involved in policy and practice, it must acknowledge the individual rights of stakeholders, including their right to privacy and the (limited but legitimate) right to protect their own interests, and it must find a way to navigate the shoals of accountability while working for improvement.

    The fitness of evidence for different purposes must recognize the distinction between policy and practice, and the capabilities and limitations of policy and practice. Policy is generally limited to two blunt instruments: law and regulation associated with law; and money applied to different purposes and under the conditions specified by policy. The inherent inflexibility of policy is its greatest weakness in solving complex, multi-faceted problems. In *Seeing Like a State: How Certain Schemes to Improve the Human Condition Have Failed*, James C. Scott analyses the factors that lead to policy over-reach and provides numerous examples of failed policy efforts to solve social problems. Policy especially fails when it over-specifies practice and constrains the abilities of practitioners to learn and take adaptive actions in the situations in which they work.

    In the policy realm evidence can and should be used to identify the scope, intensity, and geographical incidence of social problems where the tools most readily available to government (the investment of money and enacting of laws and regulations) might make an important contribution. Government can productively support research to increase the understanding of a problem, government can support efforts to increase the capabilities of practitioners, and government can influence or enable others to act by providing direct or indirect investments where money by itself is a significant factor in a problem. Evidence can and should be used to test whether policies are effective in making such contributions.

    While good policies are essential for good practice, governments and coarse-grained governmental policies and programs by themselves are incapable of solving complex problems. Complex problems require the work of skillful practitioners, whether they are health care or social service professionals, teachers, scientists, military leaders, or administrators. Evidence-based policy and evidence-based practice (some prefer practice-based evidence) in

partnership are needed to improve the human condition. "Evidence-based policy" will fail if it seeks to discover and then faithfully implement at scale practices or programs to solve complex problems. Complexity and faithful implementation at scale are inherently in conflict.

Chapter Four of the book explores these issues in some depth, including an analysis of issues related to student and institutional privacy in a proposal to create student unit record data system for higher education. The four measurement initiatives discussed in the previous chapter are evaluated in terms of five questions: a) How does the initiative serve policy makers, the public, and practitioners? b) Is the division of labor between policy and practice clear and productive? c) Are the uses of the data well suited to the capabilities of the users? d) Are privacy rights an issue? And e) Are the data accurate, reliable, valid, and fit for purpose?

5. A productive partnership between evidence-based policy and evidence-based practice requires practitioners to employ the disciplined use of evidence to improve outcomes. The practitioners of "improvement science" in industry, in health care, and more recently in education employ qualitative research techniques (which some call "reflective practice") to develop causal theories about problems and to design small-scale interventions to ameliorate the problems. They then employ quantitative techniques to test interventions quickly, study the results, learn, and adapt their strategies to obtain better results. Tony Bryk of the Carnegie Foundation for the Improvement of Teaching characterizes this approach as "small change with fast learning" as opposed to the traditional strategy of "big change and slow learning" through traditional research studies of large scale interventions.

Practitioners can learn from "laboratory" research and research based in other practice settings, but the first step in "evidence-based practice" is to consider whether and to what extent findings in a different context and setting may apply in the immediate situation. Experimentation and adaptation in the practice setting are essential for improving outcomes.

Chapter Five considers evidence-based practice in health care, education (focusing on the Networked Improvement Communities of the Carnegie Foundation for the Advancement of Teaching), and social work. It concludes, "In the end, the effective use of evidence to improve practice will require respect for the complexity of practice and the wisdom of practitioners combined with respect for scholarship—systemic analysis, the development and pursuit of theory (or hunches) about causal relationships, measurement, experimentation, and adaptation. Advances in data systems, in measurement, in basic science, and in creative ways of marrying the wisdom of practice with systemic inquiry are increasing the potential for significant progress."

The growing need to increase the breadth and quality of educational

attainment has recently led to important advances in the use of measurement to improve educational practice. The National Institute for Learning Outcomes Assessment http://www.learningoutcomeassessment.org has documented and promoted the increasing use of assessment to improve teaching and student achievement in higher education. In both K-12 and higher education, new tools have been developed for increasing the focus and clarity of learning objectives and for assessing student learning in order to improve instruction and achievement.

These tools include:

   a. The Common Core State Standards Initiative which has added clarity and focus to K-12 learning objectives http://www.corestandards.org and the summative and formative assessments it inspired have advanced the quality and sophistication of tools available to improve teaching and learning.

   b. The Degree Qualifications Profile http://degreeprofile.org and the quite similar Essential Learning Objectives published by the Association of American Colleges and Universities (AAC&U) https://www.aacu.org/leap/essential-learning-outcomes which have given colleges and universities clear targets for student learning.

   c. The VALUE rubrics https://www.aacu.org/value-rubrics, also developed by AAC&U which have provided tools for assessing levels of student learning based on actual student work, rather than unavoidably superficial standardized tests. Twelve states are participating in a demonstration project to employ VALUE rubrics in the Multi-State Collaborative, a collaboration of the State Higher Education Executive Officers and AAC&U. http://www.sheeo.org/msc

6. Public policy is not shaped simply by evidence. It is also shaped by competing interests and by varying views about the causes of and solutions to social problems. Evidence can inform and shape the views of policy makers and how they perceive their interests, but the powers of evidence are limited. In democracies, competition for influence and negotiation among competing perspectives powerfully shape policy. It is unlikely that evidence will ever become the final arbiter between competing interests and different worldviews.

But as discussed in Chapter Six, evidence can play a constructive role. Establishing widely accepted measures of important social conditions can be a powerful way for evidence to shape policy. If policymakers can agree on ways to measure facts on the ground, especially facts that are directly

relevant to the communities they represent, evidence can foster more effective policies.

Research can also inform the shared understanding of the systems that produce undesirable outcomes and the factors associated with improved outcomes. For example, over several decades research by the University of Chicago Consortium on School Research has helped policy makers and practitioners better understand and more effectively create the conditions associated with more effective schools and higher levels of student achievement. Such understanding is the first step in developing policies and practices to yield improvement.

7. In summary, the use of evidence has great potential to improve social policies and the effectiveness of specific programs and interventions. To realize this potential, however, the distinctive roles of policy and practice must be observed. Policy and practice have different capabilities, as well as different needs and uses for data and evidence. If policy seeks to improve practice by substituting policy for practice or by intruding too forcefully into the domain of practice, it will fail.

   Perhaps most importantly, improvement in practice, rather than policy accountability should be the first purpose of measurement. The halting and controversial implementation of the Common Core State Standards exemplifies the consequences of failing to observe this principle. Although it is quite helpful, almost essential for practitioners to have a common yardstick for assessing results, if measurement is predominantly employed as a tool for threat-based accountability, more energy will be devoted to avoiding or reducing threat than to improving performance.

   Instead, policy should work to create the conditions necessary for effective practice, and accept in partnership with practitioners shared accountability for improvement. Practitioners need to accept and embrace their responsibilities for using evidence to improve practice and for identifying and advocating policies that can help them become more successful. Improved outcomes require an evidence-based partnership between policy and practice.

DATA INFRASTRUCTURE AND ACCESS

During the past fifteen years a number of projects discussed in the book -- the Common Education Data Standards project, a proposed student unit record system for higher education, federal funding for State Longitudinal Data System, and the Data Quality Campaign -- confronted the questions enumerated by the Commission in this section. These observations address specific issues that I observed while participating in these projects.

1. More data are required for guiding practice than are required for guiding policy. It is close to impossible to achieve common data definitions and common practices in complying with those definitions in a wide range of domains. The more data are collected, the more difficult the challenge, and the more likely the data will not be useful. It is easier to obtain useful data for policy if the data set is coarse-grained, focusing on high-level indicators. The practice setting normally requires more data elements, but absolute fidelity to common data definitions is needed for only a few important outcomes. The solution to this problem is to collect the data that are needed for policy and for practice as separate activities. Both policy and practice data sets should employ the same definitions for the comparatively few data elements needed for policy analysis, but there is no need to have perfectly aligned data for the many thousands of data elements that will be employed in different practice settings. (The scope of the Common Education Data Standards is an example of data system overreach.)

2. In some, but not all respects, the issues involved in protecting individual privacy apply also to protecting institutional or organizational privacy. This was the underlying issue that prompted congressional action forbidding the Department of Education from establishing a student unit record system that would include data on financial assistance provided by private colleges and universities. Some situations limit the rights to institutional privacy, just as some situations limit the right to individual privacy. These need to be defined as a matter of policy, informed by the legitimate interests of all stakeholders.

3. The National Student Clearinghouse (NSC) has collected individual student enrollment and completion data in higher education for more than a decade while protecting both individual privacy and institutional privacy. These data, analyzed by the NSC Research Center, have been used to improve available information about graduation and transfer rates in higher education.

    NSC is largely supported by fees generated by outside clients for degree and enrollment verification and other uses of the data, which are approved by the students and institutions involved. A public/private partnership, employing entities like NSC could be a mechanism for financing data collection and utilization, governed by privacy policies developed by consensus among stakeholders.

4. The Patient Centered Outcomes Research Institute (PCORI)[ii] is an effort to develop a data sharing platform for improving medical practice. While consistent, reliable data collection is complex even in medicine, a large scale data set is likely to be more useful in improving medical practice than in fields with more complicated problems of measurement. This initiative might, however, provide experience useful in sorting through appropriate

boundaries between practice and policy and the privacy issues in other domains.

CONCLUSION

I would be pleased to elaborate on these comments, respond to questions, or provide additional information on any topics of interest to the Commission.

Respectively submitted,

Paul E. Lingenfelter

This is an absolute OUTRAGE! Compiling and linking data like this on private citizens - children, no less! - is something that is done in communist countries, NOT the United States of America. Mine and my children's lives are PRIVATE. Stop taking money from Bill Gates, and stay out of our private lives!

Commission on Evidence-Based Policymaking Comments
Docket ID: USBC-2016-0003
Federal Register Number: 2016-22002

Christi Hammons
Choctaw Nation of Oklahoma
P.O. Box 88
Hugo, Oklahoma 74743   November 2, 2016

Dear Chair Katharine G. Abraham, Co-chair Ron Haskins, and members of the Commission:

The Choctaw Nation of Oklahoma welcomes the opportunity to provide comments to the
Commission on Evidence-Based Policymaking (CEP). We offer input for questions 16 and 18
based on our experience as a grantee of a high-quality evidence-based program, the Office of
Adolescent Health's Teen Pregnancy Prevention (TPP) Program. This program has been
recognized as a pioneering example of tiered evidence-based policymaking, and represents an
important contribution to building a body of evidence of what works. This includes high quality
implementation, evaluation, innovation, and learning from results.

The Choctaw Nation of Oklahoma is a non-reservation-based Native American tribal
government located in 10 ½ counties in southeast Oklahoma, and was the first tribe to be named
as a Promise Zone. Youth in the Choctaw Nation face many disparities including high rates of
poverty, low educational attainment, and high unemployment. An additional disparity, and
perhaps underlying cause of other disparities, is the alarmingly high rate of teen pregnancy. In
2015, the Choctaw Nation received a TPP Tier 1B grant to address teen pregnancy in the three
Choctaw Nation counties with the highest teen birth rates. The goal of the newly implemented
program is to have a significant impact on reducing rates of teen pregnancy and existing
disparities by replicating evidence-based teen pregnancy prevention programs to scale in middle
schools, high schools, and alternative schools in Choctaw, McCurtain, and Pushmataha Counties
in southeast Oklahoma.

As a TPP Tier 1 grantee we incorporated evidence into all aspects of our project. The program
models we implemented were chosen from a list of those that had already been rigorously
evaluated and demonstrated to change behavior.

We also used evidence to guide and improve our project throughout the grant period. During the
first year of the grant, the program collected data from over 1,000 community members as well
as published resources to ensure the program chose the evidence-based models most suited for
our community. Now that the program has begun implementation, staff collect data on all
lessons taught to youth to report on performance measures as well as to improve fidelity to the
evidence-based curricula and improve the quality of the teaching activities. This data is also
used for continuous quality improvement for the program. We look forward to analyzing
comparison data over the coming years to quantify the impact this program has made.

In closing, we consider the TPP Program to be a prime example of high-quality evidence-based
policymaking. It is one of the few government programs that use evidence and evaluation

criteria throughout the grant life cycle. Thank you for considering our input for the CEP. If you have any questions or need additional information, please contact me at (580) 326-8304 (ext. 6058) or chammons@choctawnation.com.

Sincerely,
Christi Hammons
Director
Teen Pregnancy Prevention Program

Data Access Docket Number 160907825-6825-01

Data Availability:

[Docket Number 160907825-6825-01]

Request for Comments for the Commission on Evidence-Based Policymaking

There is an obvious tension between "strategies to increase the availability and use of government data" and "protecting the privacy and confidentiality of the data". But there are other tensions as well: a fair building and analysis of a data set versus finding data and building an analysis data set to support a preselected policy. The later strategy can lead to publication bias whereby results that do not support a policy are simply not published. Fund researchers that support your policy versus fund research to answer a question. There is the individual researcher incentive versus the common good.

The Request for Comments is answered in a series of short notes, usually with a pointer to relevant literature. I take the perspective of Edward Glaeser that researchers are expected to be self-serving and systems of data access and analysis should be in place to take that into account and promote the common good.

Summary:
Asking scientists to do better, share data, has not and will not work. As a condition of funding and publication, it should be a requirement that authors place their analysis data set in a public repository. One should assume that authors are self-serving and optimize getting a publication and that includes slanting the data set construction and analysis methods to get a publishable result or a result that favors a particular policy.

The analysis data set should be built in a way that personal identity is protected. For example, if the data is micro aggregated before the analysis is done, the micro aggregated data can be shared as the aggregation step protects personal identity. See "productive and counterproductive aggregation of experimental units" below.

 The raw data set and the code used to build the analysis data set should be saved in a way that it can be made public or given to a trusted 3rd party for examination. The raw data, the code used to convert the raw data to the analysis data set and the analysis data set should go to the agency that funded the work. And/or it should go to a public archive, e.g.dryad. Any work that cannot provide these things should not be funded with taxpayer money.

A study should be registered in a public registry and a summary report, results positive or negative, should be placed in the registry.

On important questions funded by government agencies, two studies should be funded, one seeking to support the claim being tested and the other seeking to deny the claim being tested.

More broadly, under what conditions is the claim supported and under what conditions is the claim not supported.

1. Joe Cecil wrote a very perceptive article on legal aspects of data access back in 1985. Here are two quotes I like:

"As an abstract principle, the sharing of research data is a noble goal and meets with little opposition. However, when data sharing is attempted in a particular circumstance, the conflicting interests of the parties can thwart the exchange. A glance at the benefits and obstacles to data sharing discussed by Hedrick (in this volume) reveals the reason: few of the benefits and most of the burdens fall to the possessor of a data set."

and

"This case suggests that an agency can insulate its actions from public scrutiny by funding a grant for controversial research and then basing its action on those findings. As long as the agency does not take possession or control of the records, the FOIA will not assist those who wish to challenge the findings that underlie the agency action."

Required data access would be a step in the right direction. There are almost always technical and operational ways to share data **IF** the will is there.

Cecil JS, Griffin E. 1985. The role of legal policies in data sharing. Pages 148-198. Sharing Research Data. National Academy Press. Washington DC.

2. The problem will not be solved by admonishing scientist to do reproducible science and make their data sets public. Or act symbiotically with those that have the data. Such thinking is hopelessly naive. We should expect scientists to act in their own best interest, which includes shaping their data set and analysis to produce a claim that is publishable, p-value <0.05, with a nice story.

Glaeser 2006, an economist, wrote against fellow economists that they did not treat themselves as they treated others. Economists typically argue that people work to their own self-interest. Glaeser said economist should take the position that researchers work to their own self-interest. They will fudge here and there. They will provide facts that support their position. They will ignore facts that do not support their story. It is not only money, grants, but it is also prestige. Glaeser used the term "optimizing researchers" for what would be called science crooks in less polite company. Requiring that data be placed in a public repository will make self-serving more difficult, but not impossible.

Some quotes:

"The solution to this problem is not to expect a mass renunciation of data mining [data dredging doing this and that to find some publishable result], selective data cleaning or opportunistic methodology selection, but rather to follow Leamer's lead in designing and using techniques that anticipate the behavior of optimizing researchers."

"After all, the impact of such techniques is invariably to reduce the significance levels of results. [get smaller p-values.] The same incentives that induce researchers to data mine will induce them to avoid techniques that appropriately correct for that data mining."

Large data sets "…give researchers new opportunities to use their initiative to enhance their results."

Discussion Paper Number 2122 Researcher Incentives and Empirical Methods. Edward L. Glaeser October 2006 HARVARD UNIVERSITY

3. Lewandowsky, writing in Nature, seems to take the position that Michael Mann of GW fame is very unfairly put upon. There is lots of evidence that Mann acted with malice: trying to get an editor fired; manipulating data and analysis, etc. Whatever the situation scientifically, open access to data would have helped. The climate data held by CRU, Climate Research Unit, was both stonewalled and manipulated. See the short book ClimateGate, The CRUTape Letters by Steven Mosher and Thomas Fuller. Ultimately Phil Jones of CRU deleted raw data so that it could not be gotten through freedom of information.

Mostly my time is my own. In Nov of 2009, I took two days to follow closely the blogging that was the reaction to a 60GB CRU data dump. The discussion was very lively and quite detailed. The overall impression was that the CRU and their inside people were science crooks. For a rather impartial look at the situation track down Judith Curry of Georgia Tech. Or look at some of the work of Steven McIntyre.

Keep in mind "Anything worth having is worth cheating for." W. C. Fields

4. In the Significance article of Young and Alan Karr, the position is taken that funding agencies and editors need to exercise their management responsibility (Demning). You cannot expect workers to clean up the lack of data access. As Deming points out, mostly <u>the workers are reacting to the incentives in place</u>. They are more or less adjusted to them, if not actually happy. Workers, work-a-day-scientists, cannot and will not change the system. Any charge to them to behave better is so much wasted ink/breath. Only the managers of the scientific system, funding agencies and journal editors, have the power to change it.

Young SS, Karr A. 2011. Deming, data and observational studies: A process out of control and needing fixing. *Significance* September, 8:122–126.

5. Air pollution is a good case in point for data access. In 2006 Roger Peng (and others) were without good access to environmental epidemiology data; he and others wanted data access. When Congress, with oversight over the EPA, wanted data, Peng blogged that Congress was just trying to cause trouble and that they should not have access to the data. Peng et al. appear to take the position that

> a. it is clearly true that current air quality is a causal killer and
> b. it would be costly to provide access to the data.

but

> a. It is possible that air quality is not a killer, e.g. Greven et al. (2011), Milojevic et al. (2014), among many others
> b. the regulation of air quality is enormously expensive without effective scientific oversight.

NB: Researchers funded by EPA on air pollution are making very serious public health claims. Where public health is concerned, data is often/usually made public or provided to a trusted 3[rd] party.

The evidence is that the EPA and their funded researchers stonewall on data access. I have a massive data set, Young et al. (2015), that makes the case that current air quality is not killing anyone.

But how can normal science work efficiently without access to data?

Greven S, Dominici F, Zeger S. 2011. An approach to the estimation of chronic air pollution effects using spatio-temporal information. *J Amer Stat Assoc*. 106:396-406.

Lopiano KK, Smith RL, Young SS. 2015. Air quality and acute deaths in California, 2000-2012. https://arxiv.org/abs/1502.03062

6. The evidence is that well over half of claims made in science papers do not replicate. Now, all of the flawed papers are full of statistics. See Begley and Ellis (2012). At some point, the public might well say: How could all these flawed claims be made in peer reviewed journals and have the blessing of statistical analysis? Why should the taxpayer fund any of this? Also, where were the real statisticians to let this go on so long and so widely?

Note that the White House, OSTP Feb2013, by executive order, require data access to taxpayer funded research. So far as I know the EPA is not in compliance. They have a policy of not accepting data sets so the FOAI will be unsuccessful. I have a letter from the EPA saying they do not accept data sets of the research they fund.

Baker, M. 2016. 1,500 scientists lift the lid on reproducibility. Nature 533:452-454. **http://www.nature.com/news/1-500-scientists-lift-the-lid-on-reproducibility-1.19970**

Begley CG, Ellis LM. 2012. Raise standards for preclinical cancer research. Nature 483:531–533.

7. Learned societies, e.g. The Royal Society, National Academy of Science, etc., take the position that researchers make their data sets available. They put the responsibility on scientists. Their position is totally without effect. The responsibility lies with funding agencies and journal editors. They need to change the incentives. But even giving the problem to the funding agencies, e.g. EPA, is not enough. The EPA lets contracts to support their policies and do not take possession of the data so that FOIA cannot reach through the agency to get the data. Policies need to be in place so that the EPA is required/has the incentive to make data available**.

Cecil JS, Griffin E. 1985. The role of legal policies in data sharing. Pages 148-198. Sharing Research Data. National Academy Press. Washington DC.

**

Use of Science Transparency Act

Any federal agency proposing rule-making or legislation shall specifically name each document used to support the proposed rule-making or legislation and provide all data used in said document for viewing by the public.

Federal Study Transparency Act

If federal funds are provided for a study, all data relating to the reporting of results of said study must be provided for scrutiny by the public at the time of publication.

8. No help from judges:

'This amount of information that can be presented to the court is huge. "You can appreciate what the 'record' looks like on review," Verkuil said. "It is enormous, and the agency has to decide what is in and what is out on its own." "Although courts can scrutinize the research and underlying data upon which the agency relied, Verkuil said, they generally defer to the agency on technical determinations. Courts recognize that they do not have the technical expertise to second-guess an agency's scientific or technical judgment.'

So the EPA, for example, does not provide the data for the papers used to support their policy and judges defer to their judgement on technical matters. Any agency can adopt the position that controversial research can be outsourced and so long as they do not take possession of the data, FOIA cannot reach through the EPA to get the data.

This is a perfect recipe for self-dealing, without any general science supervision.

The EPA, and any government agency, should be required to take possession of every analysis data set used in a publication they fund. Ideally they should require the data sets to be place in a public repository.

THE NATIONAL ACADEMIES PRESS
http://www.nap.edu/21703

9. Micro aggregation to protect personal identity.

Productive and Counterproductive Aggregation of Experimental Units

Aggregation of experimental units (usually individual persons or business entities) is quite commonly used, especially by governmental entities, in order to (legally and ethically) <u>publicly</u> share data / information while preserving personal privacy and/or anonymity. For example, summary statistics are computed and available for counties in the US.

This tactic is applied within Local Control (LC) Strategy [Def. In Local Control analysis experimental units are clustered based on the characteristic, characteristics that matter.] for statistical analysis in a particularly **productive** way (i.e. allowing / enabling conditional inference) ...to create subsets of experimental units that are <u>relatively well-matched</u> on either one or (simultaneously) several different "relevant" x-confounder characteristics. Each LC subset (cluster) represents an <u>intersection</u> of publishable x-ranges ...or, at the least, at a given x-vector centroid. [Experimental units are within clusters of similar objects.]

In stark contrast, government entities typically aggregate data for political and/or geographical units in a distinctly **counterproductive** way ...for cities, counties, states and even regions of the US. These subsets contain experimental units that are statistically diverse ...corresponding to a <u>union</u> of arbitrary (usually un-specified) x-values.

For example, consider information on smoking and mortality. Individuals supposedly control their level of participation in smoking, but city-level data typically report (census or survey data) on only the proportions of their adults in various smoking categories. Such information is <u>much less potentially informative</u> than, say, mortality rates broken down by smoking-level category. Even worse, whatever this initial aggregation is, it usually <u>cannot be subsequently undone</u> by the recipient of only aggregated data. While LC strategy can still be applied to analyses of counterproductively aggregated data in a remotely productive way, it's already much too late to have fully avoided incalculable information loss!

This committee should make a lot of noise about this key issue. All government data administrators (including the census bureau) and health-care data holders really do need to more fully appreciate the <u>information-loss penalties they are arbitrarily imposing</u> upon key observational data via counterproductive data-reporting practices (geographical aggregation and/or fire-walls between databases of competing providers.)

Obenchain RL, Young SS. 2013. Advancing statistical thinking in observational health care research, J Stat Theory Pract 7 (2013), 456–469.

10. A National Academy of Science report was issued on data sharing in the life sciences and the principles apply to other areas of research.

The report comments:

"Community standards for sharing publication-related data and materials should flow from the general principle that the publication of scientific information is intended to move science forward. More specifically, the act of publishing is a quid pro quo in which authors receive credit and acknowledgment in exchange for disclosure of their scientific findings. An author's obligation is not only to release data and materials to enable others to verify or replicate published findings (as journals already implicitly or explicitly require) but also to provide them in a form on which other scientists can build with further research. All members of the scientific community—whether working in academia, government, or a commercial enterprise—have equal responsibility for upholding community standards as participants in the publication system, and all should be equally able to derive benefits from it."

This statement describes the ideal. In practice, the standard must be enforced by those managing the scientific process, journal editors and funding agencies. See Young and Karr (2011).

"Sharing Publication-Related Data and Materials: Responsibilities of Authorship in the Life Sciences" http://www.nap.edu/catalog/10613.html.

Young SS, Karr A. 2011. Deming, data and observational studies: A process out of control and needing fixing. *Significance* September, 8:122–126.

11. To produce a publishable story, researchers will tweak data and analysis methods. Glaser 2006 argues that policies need to be in place to "anticipate the behavior of optimizing researchers". Pre-registration of studies and requiring access to data are two steps that "anticipate the behavior of optimizing researchers". Here is the abstract of Glaeser:

"Economists are quick to assume opportunistic behavior in almost every walk of life other than our own. Our empirical methods are based on assumptions of human behavior that would not pass muster in any of our models. The solution to this problem is not to expect a mass renunciation of data mining, selective data cleaning or opportunistic methodology selection, but rather to follow Leamer's lead in designing and using techniques that anticipate the behavior of optimizing researchers. In this essay, I make ten points about a more economic approach to empirical methods and suggest paths for methodological progress."

Discussion Paper Number 2122 Researcher Incentives and Empirical Methods. Edward L. Glaeser October 2006 HARVARD UNIVERSITY

12. How do you get a statistically significant result? You ask a lot of questions. If 100 questions are asked testing at the 5% level, you expect about five chance "nominally statistically significant" results, Young and Karr (2011) and Austin et al. (2006). It is well-known that most research findings fail to replicate. Austin et al. (2006) provide a humorous exposition of multiple testing problems:

"The purpose of the current study was to demonstrate the pitfalls of multiple hypothesis testing and of conducting analyses without prespecified hypotheses."

"Conclusions: Our analyses illustrate how the testing of multiple, non-prespecified hypotheses increases the likelihood of detecting implausible associations. Our findings have important implications for the analysis and interpretation of clinical studies."

Not stating a pre-specified hypothesis is common across all science.

Austin PC[1], Mamdani MM, Juurlink DN, Hux JE. 2006. Testing multiple statistical hypotheses resulted in spurious associations: a study of astrological signs and health. J Clin Epidemiol. 59:964-969.

Young SS, Karr A. 2011. Deming, data and observational studies: A process out of control and needing fixing. *Significance* September, 8:122–126.

13. Place data in a public repository

Vines et al. (2013) stated

"…we believe that journal-based mandatory data archiving policies and mandatory data availability statements should be more widely adopted."

In journals that require data sharing, most typically (2/3s of the time) data is not available.

I systematically requested 50 environmental epidemiology data sets. I got no data sets. Making data set available is not happening.

Vines TH, Andrew RL, Bock DG, Franklin MT. 2013. Mandated data archiving greatly improves access to research data. FASEB

14. Personal experience with data access A

I requested the Chay data set from the authors of the paper. Carlos Dobkin said that he would look for the data. My request was in 2014 or so. He found the data and send it to me. We did a re-analysis of the data using a new method, Local Control, that we expected to be simpler and more robust to covariates. We reached the same conclusion as Chay et al. (2003). We found no association between PM2.5 and mortality.

Chay K, Dobkin C, Greenstone M. 2003. The Clean Air Act of 1970 and adult mortality. *J Risk Uncertainty* 27:279-300.

Obenchain RL, Young SS. 2013. 2016. Local Control Strategy: Simple Analyses of Air Pollution Data can reveal Heterogeneity in Longevity Outcomes. Risk Analysis (in press)

15. Personal experience with data access B, California

I was unable to get data sets used in air quality/health effect publications. At one point I sent out a request to 50 environmental epidemiology researchers. I got no data sets. California has an open access policy. I got ~2M e death certificates. The process to get the data took 1-2 months. I paid a nominal amount for each year. I had to read and process the data into an analysis data set, several weeks of work. I got permission from California to make the analysis data set public. The personal identity of the individuals was protected in my analysis and data disclosure by micro aggregation. I gave daily deaths only, not individual person records.

16. Personal experience with data access C, London

London was the site of a massive air quality/mortality event in 1952. There was atemperature inversion and air pollution increased dramatically. It is estimated that over 4000 died. We asked for London more current daily mortality data. Again there was nominal fee for each year. In about two months we received our data. Most interestingly, the government agency also posted the data set publicly so that anyone could download the data. We asked for daily data which protected individual identity.

17. Personal experience with data access C, CDC NCHS.
We have an ongoing request for data from the US CDC National Center for Health Statistics. We would like to duplicate the work of Zanabett et al. (2009). Zanabetti would not make her analysis data set available thereby forcing our research group to duplicate data access and staging work. This process of getting access to the analysis data set (protected by micro aggregation) is into its 2nd year with no end in sight. We do not actually get the data set from NCHS. We must appear at a CDC data center and do all our work on CDC computers. We need some rather mainstream statistical analysis programs, which they do not have. It remains to be seen if we can use the analysis programs we want. All-in-all it is a colossal bureaucratic pain. Typical, the CDC NCHS has the data and they can make whatever conditions they like. Hell will freeze over before we get access to the data. They don't appear to care. The analysis data set should be available. The new researcher should not have to replicate all the data acquisition and cleaning.

Our UK supplier of data, vetted the data request and considered personal identity protected. They provide us with the data AND put the data up on a web site. They took responsibility for making the data public. Multiple legal forms are filled out for CDC/NCHS that make the receiver of the data subject to massive fines and imprisonment. Many do not have the time and patience to put up with their data access policies.

If the CDC charged a user fee, they might have the incentive to actually provide data.

Zanobetti A, Schwartz J. 2009. The effect of fine and coarse particulate air pollution on mortality: a national analysis. Environ Health Perspect. 117:898-903.

18. Young-Graham Law

The clear incentive of a researcher or a regulatory agency is not to make data available. Joe Cecil pointed that out in 1986. Effectively nothing has changed in 30 years. Cecil works for the Department of Justice and is well worth talking to. Several years ago, I asked if he was still involved or would like to be in data access. He said, <u>NO, it is/was all talk and no progress</u>. The issue is that there should be an external incentive to share data. For example, researchers should promise to share data or they get no funding. The EPA cannot use a paper to support a regulation unless the data used in the paper is publicly available. To wit

Use of Science Transparency

Any federal agency proposing rule-making or legislation shall specifically name each document used to support the proposed rule-making or legislation and provide all data used in said document for viewing by the public.

Federal Study Transparency

If federal funds are provided for a study, all data relating to the reporting of results of said study must be provided for scrutiny by the public at the time of publication.

Following the guidance of Cecil and Griffin an agency can stonewall access to data that is government funded.

19. Personal experience with data access C, Pope, NEJM 2009

Pope made a claim that the decrease in PM2.5 lead to a decrease in human mortality over the years ~1980 to ~2000. Of course, many things changed over that time period. Medical science improved, smoking declined, income improved, etc. I asked for the data set from Arden Pope and he sent me the analysis data set. I was able to show, Young and Xie (2013) that there was no effect of PM2.5 in the western US, including in particular California. I was also able to show, Young and Xie (2003) that variable most associated with improved mortality was income, 3x more important than PM2.5. Later, using the Pope data set we were able to show that if covariates are taken into account using Local Control analysis that any effect of PM2.5 on mortality varied due to covariates; Young, Obenchain and Lambert (2016). We got similar results with a much larger data set, Obenchain and Young (2016).

The presumed point of doing research is to get valid claims, claims that will replicate. An important reason to have access to research data sets is to allow scientists to carefully examine the data and methods and importantly subject the data set to additional analysis. For normal scientific oversight, there has to be access to data by the public at large or by a trusted 3[rd] party.

Young SS, Obenchain RL, Lambert cg. 2016. A problem of bias and response heterogeneity. In Standing with Giants, Moghissi and Ross, editors.

Commission on Evidence-Based Policymaking Comments
Docket ID: USBC-2016-0003
Federal Register Number: 2016-22002

Ntarupt - North Texas Alliance to Reduce Unintended Pregnancy in Teens
Fund of the Dallas Foundation
624 N. Good-Latimer Expy, Suite 100
Dallas, Texas 75204
November 4, 2016

Dear Chair Katharine G. Abraham, Co-chair Ron Haskins, and members of the
Commission:
Ntarupt welcomes the opportunity to provide comments to the Commission on Evidence-
Based Policymaking (CEP). We offer input for questions 16 and 18 based on our
experience as a grantee of a high-quality evidence-based program, the Office of
Adolescent Health's Teen Pregnancy Prevention (TPP) Program. This program has been

recognized as a pioneering example of tiered evidence-based policymaking, and represents an important contribution to building a body of evidence of what works. This includes high quality implementation, evaluation, innovation, and learning from results.

o Our Mission: To increase the quality of life for children, families and communities by preventing unintended teen pregnancy; and
o Our Vision: That every young person in our community has the opportunity to set goals, plan an education and a career, and become self-sufficient before entering into parenthood.
As a TPP Tier 1 grantee we incorporated evidence into all aspects of our project. The program model we implemented was chosen from a list of those that had already been rigorously evaluated and demonstrated to change behavior.
We also used evidence to guide and improve our project throughout the grant period.
1. We conducted an in depth needs assessment with parents, teens, medical providers and teachers in the grant area.
2. We selected evidence based interventions, using the Getting to Outcomes framework, which suited the populations.
3. We have added evaluation of our programs using pre- and post- tests to ensure that the intervention is doing what is supposed to do.
4. We have delivered to both teens and their parents, reinforcing their knowledge, attitudes and ability to communicate about delaying sexual initiation. We are finding that, once we are able to talk to parents, they are very much in favor of their children being educated.
5. The pilot period has allowed our outreach to be in depth, and we are just now able to take advantage for recruitment. Cutting funds at this point would not allow the community and the government to reap the fruits of this investment.

In closing, we consider The TPP Program to be a prime example of high-quality evidence-based policymaking. It is one of the few government programs that use evidence and evaluation criteria throughout the grant life cycle. Thank you for considering our input for the CEP. If you have any questions or need additional information, please contact me at 214-717-6477or tggreenberg@ntarupt.org

Sincerely,
Terry Goltz Greenberg,
CEO, Ntarupt

Commission on Evidence-Based Policymaking Comments
Docket ID: USBC-2016-0003
Federal Register Number: 2016-22002

Ntarupt - North Texas Alliance to Reduce Unintended Pregnancy in
Teens
Fund of the Dallas Foundation
624 N. Good-Latimer Expy, Suite 100
Dallas, Texas 75204
                                        November 4, 2016

Dear Chair Katharine G. Abraham, Co-chair Ron Haskins, and
members of the Commission:
```

Ntarupt welcomes the opportunity to provide comments to the Commission on Evidence-Based Policymaking (CEP). We offer input for questions 16 and 18 based on our experience as a grantee of a high-quality evidence-based program, **the Office of Adolescent Health's Teen Pregnancy Prevention (TPP) Program**. This program has been recognized as a pioneering example of tiered evidence-based policymaking, and represents an important contribution to building a body of evidence of what works. This includes high quality implementation, evaluation, innovation, and learning from results.

- o **Our Mission**: To increase the quality of life for children, families and communities by preventing unintended teen pregnancy; and
- o **Our Vision**: That every young person in our community has the opportunity to set goals, plan an education and a career, and become self-sufficient before entering into parenthood.

As a **TPP Tier 1 grantee** we incorporated evidence into all aspects of our project. The program model we implemented was chosen from a list of those that had already been rigorously evaluated and demonstrated to change behavior.

We also used evidence to guide and improve our project throughout the grant period.
1. We conducted an in depth needs assessment with parents, teens, medical providers and teachers in the grant area.

2. We selected evidence based interventions, using the Getting to Outcomes framework, which suited the populations.
3. We have added evaluation of our programs using pre- and post- tests to ensure that the intervention is doing what is supposed to do.
4. We have delivered to both teens and their parents, reinforcing their knowledge, attitudes and ability to communicate about delaying sexual initiation. We are finding that, once we are able to talk to parents, they are very much in favor of their children being educated.
5. The pilot period has allowed our outreach to be in depth, and we are just now able to take advantage for recruitment. Cutting funds at this point would not allow the community and the government to reap the fruits of this investment.

In closing, we consider **The TPP Program** to be a prime example of high-quality evidence-based policymaking. It is one of the few government programs that use evidence and evaluation criteria throughout the grant life cycle. Thank you for considering our input for the CEP. If you have any questions or need additional information, please contact me at 214-717-6477or **tggreenberg@ntarupt.org**

Sincerely,
Terry Goltz Greenberg,
CEO, Ntarupt

9. What specific administrative or legal barriers currently exist for accessing survey and administrative data?

Currently, the data application procedures for accessing survey and administrative data are extremely time-consuming and cumbersome, and sometimes appear to involve unnecessary steps. For example, the national mortality data with individual-level information for specific date and cause of death are considered research identifiable data, and the Centers of Disease Control and Prevention (CDC) website clearly indicates that such data can only be accessed through a data application to The National Center for Health Statistics (NCHS). Before submitting an application to NCHS, one is required to first submit a formal data application to the National Association for Public Health Statistics and Information Systems (NAPHSIS) for national vital record-based datasets. NAPHSIS only releases aggregated mortality data (*i.e.*, at population level), but researchers who explicitly request for individual-level mortality data cannot bypass this organization. A review by the NAPHSIS research committee often takes several months to complete. It is not clear why it takes this much time, and this often is a major barrier to completing research.

In addition, the application processes and requirements for data access are often unfavorably biased towards researchers and institutions in the non-profit sector. For example, the Centers for Medicare & Medicaid Services (CMS) collects administrative data on Medicare and Medicaid enrollees, and such data can be accessed through formal data applications. However, the CMS does not allow for-profit entities to receive physical copies of the data regardless of the purpose of data access whereas such restrictions are not applicable to academic institutions. In current CMS rule, for-profit entities can only access the data through an online virtual data center for which the costs are often considerably higher than purchasing physical data copies. It is not clear how such restrictions towards for-profit entities are justified or whether CMS has any legal standing to impose them.

10. How should the Commission define "qualified researchers and institutions?" To what extent should administrative and survey data held by government agencies be made available to "qualified researchers and institutions?"

Qualifications for researchers should be based on education, publications, and past experience. In addition, a review of the methods of the proposed work should be informative regarding whether the researchers have the qualifications to complete the work (based on their ability to scope the work). Whether an institution is non-profit or for-profit should have no bearing on the determining a researcher's qualifications.

All data should be made available to qualified researchers and institutions so long as it is clear the research will be beneficial to public health and that it will not violate any person's privacy.
